| Human capital | The knowledge, skills, and competencies embodied in individuals that facilitate the creation of personal, social, and economic well-being (OECD 2001: 18). |
| Interventions | Is a people-centered development approach for positive change from participation of real target groups in policy initiation, implementation, monitoring, and evaluation processes. |
| Human development | UNDP defines human development as a process of enlarging people's choices such that people can lead a long and healthy life, acquire knowledge, and have access to the resources they need to have a decent standard of living. |
| Poverty reduction | Strategic policy measures, both economic and humanitarian, that are intended to permanently lift people out of poverty. |

## Introduction

Green et al. (2006) argue that growth with poverty reduction has become the goal of development strategy. They further contend that increased access to fund by the poor can directly contribute to poverty reduction. The foregoing highlights the link between human capital and poverty. However, there are other issues not referenced. Access to education and training on efficient utilization of financial resources need keen attention for a people-centered poverty reduction strategy and sustainability. Education of citizens signals the beginning of goal-oriented and sincere intervention projects/programs of governments. Thus, for attainment of poverty reduction agenda, human capital intervention must contain not only the economic aspect but also the educational capability component. World over success or failure of any human capital intervention (HCI) policy derives from the lack of integration of the human capital ramifications with enormous consequences for the target social demographic.

The foregoing aptly depicts the picture of Nigeria's intervention experience nearly 60 decades. From 1960 to date, human capital development policies in the country have been inappropriately conceived, making poverty

reduction a mirage. This has implication for the attainment of the current sustainable development goals 1 and 2 targets in Nigeria (Ukeje 2019). Nigeria planning commission for Vision 2020 noted that MDGs recorded underachievement with a reasonable percent of its population still living below the poverty level, facing food insecurity and high child/maternal mortality rate (Moizza 2015). According to Edoh, the Vision 2010 Committee Report revealed that 80% of Nigerians lived below the poverty level (as cited in Anger 2010). In effect, the drive for inclusiveness, equity, partnership, and institutional capability has been consumed by the erroneous conception of human capital components. Lack of basic skills, competencies and capabilities denies the violence and risk-prone poor and uneducated majority a voice on matters that affect.

All experimented programs/projects relegated the educational component to the background. Shock suffered by both the implementing institutions and target beneficiaries highlights the importance of requisite educational capability for a real takeoff. Consequently, the challenge of coordinating various intergovernmental institutions, ministries/parastatals, and other stakeholders reflects the logic of "square peg in a round hole" for policy domestication and implementation (Ukeje et al. 2019a). The process of recruitment for policy matters also shares hugely from the blame (Ukeje et al. 2019a).

As a point of departure, human capital interventions must be so comprehensively conceived for the real poverty issues to be addressed. Interventions in economic sense without recourse to the education aspect have characterized Nigeria's human capital development policies. Relationship between human capital development and the general development needs has also not been properly aligned in various intervention programs, hence, the decline in economic growth and rise in poverty scale.

This entry aims at examining the relationship between HCIs and poverty reduction in Nigeria and how failure or success of the former influences the outcome of the latter. This entry, therefore, provides in-depth analysis of participatory human capital interventions and explores how its neglect underpins failures of national development programs and policies in Nigeria. It further explores how HCIs underlines the attainment of Nigeria development goals whether or not endogenously conceived.

## Intervention: A Conceptual Review

Relevance of human capacity development and its multiplier effects on national development call for governance driven by proactive action, competence, pragmatism, negotiation, and political will. According to Loss (2008), "An intervention is an intended, planned, and targeted operation in a system or process which aims at removing or preventing an undesirable phenomenon." It is considered a scheme for different elements and activities needed to realize intended result of a program. Loss further argues that multi-strategy interventions were considered the most effective in achieving desired and enduring change as there is potential to reach a larger number of people in a variety of ways. By influencing individual's knowledge, attitudes, beliefs, and skills; increasing social status; and creating supportive environments, policies, and resources, intervention creates change, Loss submits.

One interventionist approach is targeting strategy. Interventionist strategy is a tool of government in enhancing the closing of empowerment gaps in the society. The identified gaps are closed by targeting mechanism, which is inherently restrictive. Every policy has targeting undercurrent (Meessen and Criel 2008). For instance, economic and education policies target the poor and the illiterate, respectively. It is a focused group policy that delineates population needs. Targeting is a necessary means of empowerment with many benefits. It enhances efficient management of limited resources arising from its goal-oriented character leading to access restriction to the nontarget group. It is couched in efficiency and effectiveness. Intervention has recently been assigned a plethora of designation and mode alternatives to top-down, elitist, and centric character with the intention of popular and stakeholder ownership connotation.

From the foregoing, intervention is a multi-stakeholder and participatory approach. However, it is a misleading and oversimplified contemplation to argue that development and intervention can achieve intended objectives from "participation" standpoint only. What drives a meaningful intervention and development is constructive engagement of stakeholders. However, levels of enlightenment and knowledge underlie constructive and well-informed discussions. Most literature stops at popular participation, without fully unfolding and stretching participatory intervention blanket. Education of the target beneficiaries is central to intervention initiatives. Although modern view of intervention is a people-oriented drive that requires all-inclusive approach, its broad application transcends numeric characteristic to include economic, educational, and health capabilities. It is only when these conditions are in place that well-intended intervention can occur. People-centered interventions for positive change proceed from participation of real target groups and implementing agencies that possess requisite skills, competencies, and capabilities in policy initiation, implementation, monitoring, and evaluation processes. Local populations are comprehensively engaged in the entire policy process. Leaders, however, have been shaped by the emergent focus on governance in ensuring efficiency in the management of resources for public good. Importantly, involvement of empowered stakeholders and issue-focused approach is rapidly succeeding representative participation (Kristof et al.).

## Human Development Components and Targets

To human paradigm, human development is composed of four main interdependent components, which include productivity, equity, sustainability, and empowerment. First, people must be rendered capable of raising their productivity level and be made to have full participation in the generation of income and paying job. Second, accessible equal opportunities must be guaranteed, removing all political and economic barriers to opportunities. Third, accessible opportunities for both the present and future generations must be guaranteed. Fourth, the people must not be denied of full participation in decisions and processes that affect them.

From a structural standpoint, Nye argued that development must combine output increase with structural changes such as decrease in poverty, inequality, unemployment, and increased access to basic social amenities (as cited in Atelhe and Agada 2014).

## Human Capital Intervention for Poverty Reduction: The Nigerian Experience

Smart governments take human capital as a window into their citizens' welfare maximization. Kristof et al. (2008) identified the executive as the authoritative custodian of political leadership, which is empowered to set goals and devise strategies for realizing them through influence and resource allocation. By the nature of political leadership, the government reaches the people through the organized agencies. According to Tucker, leadership is the nature of obligation to role required to accomplish the tasks for meeting needs and demands through mobilization of persons involved (as cited in Kristof et al. 2008). Proper statistical documentation for realistic planning and budgeting clearly demarcates governments of various nations. It requires the human capabilities to understand and act almost accurately in the most preemptive and responsive manner on matters of public interest.

The narrative in Nigeria is worrisome! A country endowed with enormous human and natural potentials proved to struggle with harmonization and development of these resources. The fact that leaders are drawn from the available population means that the government capacity or lack of it mirrors the condition of its population. Negative conditions of Nigerian public institutions and establishments have greatly hampered policy implementation and economic growth on account of poor and undeveloped human potentials. Okonjo and Osafo (2007) observe that about 70% of policy drivers in government institutions

had a high school diploma or lower, with less than 5% possessing modern computer skills. Indeed, various governments have initiated several political and administrative reforms with a view to achieving some measure of development in Nigerian political governance (Ukeje et al. 2015; Offu et al. 2018; Idike et al. 2019), but results have always shown to be negative due to the existence of too many policies without political will for implementation (Ukeje et al. 2019b). Among intervention initiatives include the Operation Feed the Nation (OFN) of 1976 under the military government of General Olusegun Obasanjo; Shagari's Green Revolution of 1980; and Mass Mobilisation for Self Reliance, Social Justice, and Economic Recovery (MAMSER) in 1987 under President Babangida; Structural Adjustment Programme (SAP) in 1986; the Agricultural Credit Guarantee Scheme (ACGS) in 1977; National Poverty Eradication Programme (NAPEP) in 1999; River Basin Development Authority (RBDA) of 1978; Rural Banking Scheme (RBS) of 1978; Directorate of Food, Roads and Rural Infrastructure (DFRRI) of 1986; National Agricultural Land Development Authority (NALDA) in 1991; National Economic Empowerment and Development Strategy (NEEDS); National Special Programme on Food Security (NSPFS); and the National Accelerated Food production Programme (NAFPP). In the end, these programs failed to address the social problems for which they were created.

The reasons, according to Eme and Emeh (2012), stemmed from the absence of basic infrastructures and social amenities that would attract rural dwellers and improve their lives. Although the lack of infrastructures and social amenities has been identified, it does not sufficiently provide the fundamental explanation for the failure of the programs. Rather, the noninvolvement of the real local stakeholders in the policy formulation, design, and execution through genuine need assessment led to misplaced priorities of the community dwellers. Firstly, national development cannot be achieved without guaranteed security and empowerment of the rural communities through their active involvement in all stages of policy process since majority of the people are rural dwellers. Secondly, there was capacity question surrounding the implementing agents. Thirdly, the lack of know-how among the target groups limited their constructive involvement and engagement. Generally, no fewer than five Development Plans, including the Rolling Plans and Vision 2010–2020, have been experimented in Nigeria (Onah 2010). The dismal performance of National Plans in Nigeria is exacerbated by what Egonmwan and Ibodje (2001: 60) referred to as the "big push" strategy – the aspiration to develop all areas at the same time with a view to presenting a politically acceptable program which would meet the yearnings of the populace.

All this has created different policy outcomes for different strata of Nigerian citizens and raised question on the claim to the practice of good governance by various governments. Good governance is the ability of the government to live up to the expectations of greater number of the population by way of meeting their needs. Osisioma (2012) identified good governance as the degree to which the virtues of human rights – civil, cultural, economic, political, environmental, and social – are enhanced. A linear relationship between human rights and human development is underlined by the fact that neglect of the former impinges on capability expansion (Fukuda-Parr 2011).

Lack of education and understanding of relationship between human rights and human development has robbed the average Nigerian citizens of opportunities capable of improving their human capital. Interventions targeted at the poor were characterized by exclusion and inclusion mechanisms in which the privileged political agency profiteers hijacked the intervention opportunities, thereby unjustly displacing real policy target beneficiaries. The skewed allocation of intervention benefits becomes an avenue to compensate and enrich political loyalists and acolytes to the disadvantage of intended target social strata. This phenomenon vividly describes capability restriction and political constraints on freedom and justice, which sharply contrast with human rights commitments. At the heart of real economic development lies with providing the people with the capabilities to fulfill their need, wants, and

desires (UNDP, as cited in Neumayer 2010). The effect, however, is the growing poverty rate in the country. Poverty-induced security predisposes victims to greater uncertainty and unpredictability, as well as vulnerability to volatile economic circumstances (Sharma 2009; Okpata and Ukeje 2017). Anger (2010) corroborates the above position of the paper when he identified high rate of corruption and misappropriation of funds by public office holders as major contributors to the low performance of MDGs and National Economic Empowerment and Development Strategy (NEEDS) in Nigeria.

Rather than encompass the entire gamut of human capital, interventions in Nigeria have focused on the "economic" dimension only, neglecting the educational component. This might enjoy some support of Tyoden's (2006) submission that economic security is a long-term goal of intervention policy. But, absence of purposeful and goal-oriented organized sensitization mechanisms for the most vulnerable poor illiterate Nigerians casts aspersions on governments' intervention policy and undermines their fundamental human rights. In the above circumstances, therefore, they are potential losers in the society's scheme of things on the one hand, because they lack the basic information asset to effectively connect to intervention opportunities and, on the other hand, because they cannot express their frustrations loudest for redress. The effects, according to Albinus (2012), are the direct relationships between poverty, unemployment, inequitable distribution of wealth, and social vices such as militancy, kidnapping, bombing, armed robbery, and destruction of government property, among others. This is in a bid to fulfill certain social obligations such as marriage, debt servicing, healthcare, and education of their relatives.

However, indebtedness arising from social obligations such as unregulated burial activities and profligacy has driven the middle class to engage in exploitative means of wealth creation (Hull and James 2012). The above observation derives credence from a UNDP Report (1998) that those who captured the benefits of the various poverty reduction strategies were not the Nigerian poor but the Nigerian rich and powerful (as cited in Onah 2010). Firstly, short change of the intended policy targets, therefore, derives from psychosocial needs and social pressure of policy-implementing agencies. Secondly, in circumstances where there exists enabling knowledge base, it becomes unbearable to contemplate expending available insufficient income in insisting on justice and defense of rights. The most exciting but fraudulent pre-intervention implementation engagements create virtually lasting emotional disturbances. In cases where there exist production and printing of guidelines, organization of training, radio communication, and face-to-face interaction with eligible members, the actual selection stage is consigned to the most secret arrangements and lacks ethical selection criteria.

Consequently, intervention projects end up being either underutilized or abandoned as inoperative. Sometimes, health clinics, schools, and empowerment centers are concentrated in areas far from needy majority of the target groups in submission to directives and preferences of the powerful resulting in increased accessibility costs needlessly. Moreover, items such as drugs are sold at unaffordable prices to intended beneficiaries should they ever become aware of availability. The items are always shared among the privileged few in whose custody and care is the distribution.

The major effects of the above practice are manipulations and short changes in the system in which Sambo (2014) observes that estimated 45,000 ghost workers are on the payroll of 251 Ministries, Departments and Agencies (MDAs). Furthermore, the same negative intervention practice prompted Al-Gazali (2011) to argue that over 400 federal government service agencies performed below citizens' expectations in public service delivery despite huge financial allocation, leading to significant erosion of public confidence in policy implementation. Pertaining to educational/vocational opportunities or other material offer such as grant, there is endless recycling of beneficiaries. In the absence of living claimants, fictitious names emerge and benefits claimed by proxies. Ironically, most times, these activities enjoy elaborate government approval,

which is why complaints of short changes are unattended to.

The trend has progressively strengthened by passing years with increasing poverty rate. For instance, according to Fitch report, poverty level rose from 60% in 2015 to 72% in 2016 (as cited in Eke 2016). Similarly, Onwubiko (2017) affirmed that poverty level in Nigeria increased to 72% by August 2016. In the same vein, the Bureau of Statistics release showed 112 million Nigerians lived below poverty line in 2016 (as cited in Ahiuma 2016). Concerned with the negative trajectory in Nigeria's development question, every government develops strategic policy direction without a thorough impact assessment. One fundamental problem of Nigeria's development strategies points to deficient statistics to track performance, provide necessary information, and evaluate the policies.

## Conclusion

The role of HCIs in poverty reduction makes real development desirable, attainable, and sustainable. Real target group-induced intervention reduces development to a tangible, concrete, and attainable concept when anchored on capability – education, health, and economic. The alienation of the critical social segments of the Nigerian state from policy process and accessibility of intervention opportunities owes more to education condition, and it constitutes a breach of human rights. From the Nigerian example, the situation has further reduced prospect of capability attainment with increasing poverty scale. The finding revealed that persistent poverty level in Nigeria, despite several policy reforms and interventions by different regimes, results from capacity-deficient implementing institution and noninvolvement of the real target beneficiaries.

Loss of sense of ownership of interventions by the local stakeholders through denied partnership with government's agencies limits chances of intervention success. Intervention process not driven by the local stakeholders who understand the nature and complexity of the problem, language, values, and culture of the community is most likely to produce unintended consequences. The government institutional approach largely explains the identified contradictions of participatory intervention. Deployment of policy drivers outside their places of origin who dominate all the stages of policy implementation hampers the process of identification of the real policy targets. Furthermore, it undermines the process of project monitoring, which includes review of the project, inputs, outputs, and impacts. It equally hinders the process of policy evaluation by imposing constraints on re-examining project assumptions, casual relationship, targets and design for attainment of policy goal, and sustainability. Consequently, the long-term intervention objective of poverty reduction through empowerment of endangered social segment remains unattainable.

# Human Development in Qatar

Hend AlMuftah
Doha Institute for Graduate Studies, Doha, Qatar

## Synonyms

Human capital; Human development; Human Development Index

## Definition

Human development (HD) is the process of enlarging people's opportunities and choices and improving their well-being. HD is about the real

freedom ordinary people have to decide who to be, what to do, and how to live. Generally, HD is about expanding the richness of human life rather than simply the richness of the economy in which human beings live.

## Introduction

In 1990, the first UNDP Human Development (HD) Report introduced a new approach for advancing human well-being. Central to the HD approach is the concept of capabilities. Basic capabilities valued by virtually everyone include good health, access to knowledge, and a decent material standard of living. HD focuses on improving the lives people lead rather than assuming that economic growth will lead to greater well-being for all; thus, income growth is seen as a means to development rather than an end in itself. Three foundations for HD are to live a long, healthy, and creative life, to be knowledgeable, and to have access to resources needed for a decent standard of living. Once the basics of HD are achieved, they open up opportunities for progress in other aspects of life. Generally, HD has two dimensions: formation of human capabilities, such as health and higher knowledge and skill, and people's use of these capabilities in leisure time, following the constructive goals, and doing social, cultural, and political activities. If the HD cannot balance these two dimensions, human life is likely to decline at a high level.

As a rich hydrocarbon economy, Qatar invested its wealth in building its economic and human developments. Since Sheikh Hamad bin Khalifa came to power in 1995, many economic and educational reforms had occurred. Qatar has had remarkable economic growth relative to its neighbors in the last decade, becoming one of the world's fastest-growing and highest per capita income countries.

Qatar issued four National Human Development Reports (NHDR) since 2006. The first, NHDR (2006), reviewed the country's progress with respect to comprehensive HD. The second, Advancing Sustainable Development (2009), focused on the sustainable development challenges of rapid economic development and critical environmental parameters that are essential for national planning. The third, Expanding the Capacities of Qatari Youth, Mainstreaming Young People in Development (2012), focused on the development opportunities and challenges facing Qatar's youth. The fourth NHDR, focused on Qatar National Vision 2030: The Right to Development, reflects a commitment to deepening the national and international consensus that development entails much more than seeking economic growth. While emphasizing national identity, culture, heritage, and Islamic values, national HD must promote, respect, and protect the rights of all individuals. This report will focus on discussing HD of Qatar during 1990–2015 in terms of the formation of human capabilities basically through education; some health indicators will be also presented. The report is based on the available date from Qatar's governmental authorities and UNDP.

## Qatar: New Era

Since the discovery of oil and gas, Qatar transforms itself from desert sheikhdoms into modern state. This process has been accompanied by very ambitious economic development and rapid population growth. Qatar is endowed with tremendous reserves of oil and natural gas but with a small population of nationals. As a result, over the last decades, Qatar has depended on the exploitation of natural resources rather than on its human capital, for its wealth. In doing so, it has relied on a large influx of foreign workers, particularly in the private sector construction industry, which in turn resulted in increased pressure on the country's social services (mainly health and education). The number of Qatar's population has multiplied about 24 times within more than four decades and a half. Qatar's population increased from 111,000 persons in 1970 to 2,634,234 in September 2017 (Sukkan Newsletter, March 2017, http://www.mdps.gov.qa/en/Pages/default.aspx).

This approach has resulted in greater wealth in the short term, which in turn led to substantial improvements in living standards through

infrastructure, social services, as well as employment and ultimately in improved measures of HD, but has not provided for sustainable long-term social and economic development although the government has helped raise living standards.

Due to Qatar's small size of national citizens, Qatar's development strategy recognizes that a key ingredient of a knowledge-based economy is a skilled and intellectually capable workforce rather than relying on natural resources. Qatar's Third 4th National Human Development Report, 2015, recognizes the lack of knowledge capital as one of the main challenges facing Qatar in the long run.

Using its rich national resource base, Qatar has achieved a leap in social and economic transformation as it raised the income, improved all health outcome indicators, and made basic schooling and postsecondary education universal. Qatar cannot accomplish its ambitious economy and development projects without its human capital and resources: its people. Accordingly, Qatar vision 2030 entails a holistic human capital approach that caters an educational, health, and systems with high international standards. This was clearly emphasized in Qatar National Vision (QNV) 2030: an educated population, a healthy population physically and mentally, and a capable and motivated workforce. QNV 2030 is built on sustaining development for current and future generations.

## Qatar's HDI Value and Rank

As mentioned earlier, the HDI is a summary measure for assessing progress in three basic dimensions of HD: a long and healthy life, access to knowledge, and a decent standard of living. A long and healthy life is measured by life expectancy at birth. Knowledge level is measured by mean years of education among the adult population, which is the average number of years of education received in a lifetime by people aged 25 years and older, and access to learning and knowledge by expected years of schooling for children of school-entry age, which is the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of age-specific enrolment rates stay the same throughout the child's life. The standard of living is measured by gross national income (GNI) per capita expressed in constant 2011 international dollars converted using purchasing power parity (PPP) conversion rates.

Due to the uncontrolled increase in Qatar's population size, it resulted in substantial changes in the population's age structure (expanding the working age group 15–64), which in turn have played a major role in activating various human development pillars being witnessed by Qatar. Among the most used indexes to measure the level of HD achieved in a state compared to another state are life expectancy at birth (as an indicator of health development level), average study years (as an indicator of educational level), and gross national income per capita (as an indicator of public welfare). According to the UNDP report in 2016, Qatar ranked first in the Arab World and 33 globally (Table 1).

Between 1990 and 2015 (Fig. 1), Qatar's HDI value increased from 0.754 to 0.856, an increase

**Human Development in Qatar, Table 1** HDI and its components

| Country | Order according to HDI | HD value in 2015 | Life components | | | |
|---|---|---|---|---|---|---|
| | | | Life expectancy at birth (years) 2015 | Average study (years) 2015 | Expected number of study years (years) 2015 | Gross national income per capita (purchasing power parity in $ in 2011) 2015 |
| Norway | 1 | 0.949 | 81.9 | 12.7 | 17.7 | 67.611 |
| Qatar | 33 | 0.856 | 78.3 | 9.8 | 13.4 | 129.916 |
| Saudi Arabia | 38 | 0.841 | 74.4 | 9.6 | 16.1 | 51.330 |
| Niger | 178 | 0.353 | 61.9 | 1.7 | 5.4 | 889 |

Source: UNDP, Human Development Report (2016)

**Human Development in Qatar, Fig. 1** Trends in Qatar's HDI component indices 1990–2015 (Source: Human Development Report 2016, Human Development for Everyone, UNDP)

of 13.5%. The UNDP statistics of 2016 indicated that Qatar's HDI value for 2016 increased to 0.856 – which put the country in the very high HD category – positioning it at 33 out of 188 countries and territories. The rank is shared with Cyprus and Malta. In terms of HD indicators, the UNDP report indicates that between 1990 and 2015, and as a result of Qatar attention given to health sector, life expectancy at birth increased by 3.4 years, from 75.7% in 2007 to 78.3% in 2015; thus, the life expectancy at birth in Qatar is almost 10% more than the global rate (Sukkan, March 2017).

On the other hand, the comparison of health expenditures of the southwest Asian countries showed that maximum and minimum health expenditure belonged to Israel and Afghanistan, respectively. After Israel, the highest health expenditures were, respectively, related to the United Arab Emirates, Qatar, Cyprus, Kuwait, and Bahrain, which subsequently experienced favorable HDI (Mirahsani 2016). Mean health expenditure in Qatar is $1528 at purchasing power parity (PPP) per capita.

Qatar's mean years of schooling increased by 4.4 years, and expected years of schooling increased by 1.6 years. Qatar's GNI per capita increased by about 72.6% between 1990 and 2015 (Human Development Report 2016, Human Development for Everyone, UNDP), the matter that reflects Qatar's investment in its population education.

In terms of the HD progress, as measured by the HDI which can usefully be compared to other countries, it is indicated that although Qatar's 2015 HDI of 0.856 is below the average of 0.892 for countries in the very high HD group, it is above the average of 0.687 for countries in Arab States. From Arab States, countries which are close to Qatar in 2015 HDI rank and to some extent in population size are Bahrain and the United Arab Emirates (UAE), which have HDIs ranked 47 and 42, respectively, compared to Qatar's rank of 33. Generally, Qatar ranked 1st among all the Arab countries and 33rd globally in the HDI report of 2016, which in turn reflects the progress of Qatar's HD since the 1990s. Gross national income per capita witnessed an increase from USD 87,478 (purchasing power parity in dollars in 2005) in 2010 to USD 129,916 (purchasing power parity in dollars in 2011) in 2015.

## Gender Development Index (GDI)

With regard to Gender Development Index (GDI), based on the sex-disaggregated HD Index, defined as a ratio of the female to the male HDI, the GDI reflects gender inequalities in achievement in the same three dimensions of the HDI: health (measured by female and male life expectancy at birth), education (measured by female and male expected years of schooling for children and mean years for adults aged 25 years and older), and command over economic resources (measured by female and male estimated GNI per capita). The female HDI value for Qatar is 0.851 in contrast with 0.859 for males, resulting in a GDI value of 0.991. In comparison, GDI values for Bahrain and the United Arab Emirates are 0.970 and 0.972, respectively.

## Gender Inequality Index (GII)

In terms of the Gender Inequality Index (GII), the 2015 HD Index showed that Qatar has a GII value of 0.542, ranking it 127 out of 159 countries. It is very clear that Qatar has made significant strides in the area of women's rights and their empowerment, especially in education and health, where the country is a regional leader. However, challenges remain in ensuring women's equal access to decision-making and in their political empowerment. In this regard, it is indicated that only 0.1% of parliamentary seats are held by women, although 70.9% of adult women have reached at least a secondary level of education compared to 67.8% of their male counterparts. In addition, female participation in the labor market is 53.6% compared to 94.2 for men. In terms of health indicators, it is shown that for every 100,000 live births, 13 women die from pregnancy-related causes, and the adolescent birth rate is 10.7 births per 1,000 women of ages 15–19. Generally, compared to other Arab countries, Qatar ranked 127, while Bahrain and the United Arab Emirates ranked at 48 and 46, respectively, on this index.

One of the largest changes in Qatar over the last two decades is in the education and employment of Qatari women. Qatari female participation in the local labor force increased from 27.4% in 2004 to 34.7% in 2013 and to 53% in 2014 (4th Qatar 4th National Human Development Report, 2015 2015, 35–58). In terms of Qatari females' unemployment, it was indicated in 2001 that about 22% were unemployed. By 2009, this had declined to 1.9% and to 0.7% in 2017 (Qatar Statistics Labour Force Survey, 2010, Labor Force Survey, the 2nd Quarter, June 2017). However, Qatari females' unemployment rate remains high compared to their counterparts Qatari males and particularly among young women aged 20–24 and high school graduates (ibid., 32).

Generally speaking, Qatari females' participation in the labor market increased over the last decades, where they represent 68% of workers in the government sector, 52% are occupying professional jobs (ibid., 58). This can likely be explained by the higher achievement of females in education, increase in female role models in Qatar, and a subsequent rise in workforce participation. This may be also the result of cultural factors, as women are traditionally placed in roles such as teaching or clerical work, where they are not exposed to mature males. In turn, this may also be attributed in part to the "equal pay for equal work" in the Qatari constitution. However, although the gap in wages between Qatari women and males decrease over time, it is still existing among some professional and managerial positions (Al Muftah 2010; 4th Qatar 4th national Human development Report, 2015 2015, 35).

## Conclusion

Relying on the above HD indicators for several years (1990–2015), the average annual rate of increase for Qatar's HDI is 0.51% within a quarter century, where it increased from 0.754 in 1990 to 0.856 in 2015, which underlines the massive development efforts being exerted by Qatar and its wise leadership aiming at realizing more development achievements and ensuring a decent life for its citizens. Qatar has, and continues to make, conspicuous progress in improving HD – moving from 57th to 33rd in the UNDP Human Development Index between 1997 and 2015. As Qatar moves toward implementing and monitoring the 2030 agenda, the HD approach remains useful to articulating the objectives of development and improving people's well-being by ensuring an equitable, sustainable, and stable planet.

However, quality not quantity of HD must be considered to assess and ensure that HD benefitted everyone. In this regard, two very important questions should not be ignored: who has been left out in the progress of Qatar's HD and how and why did that happen? Usually, it is poor, marginalized, and vulnerable groups, indigenous and migrant children, women, and elderly people who might be left behind at some extent. Thus, advancing HD through efforts to reach everyone and carrying for those left out requires meaningful and

well-designed policies, including policies with appropriate focus, measures for groups with specific needs, and interventions to protect HD gains. Such policies should involve ensuring people's participation in influencing policies and in evaluating development results, particularly the voice of the marginalized and vulnerable groups as mentioned above.

To conclude, Qatar would be near the top of the HDI if integration and adjustments were made for the country's large population of migrant workers, as they comprise the largest proportion of Qatar's population with low level of education (unskilled workers in the private sector which in turn distort HDI). If the HDI measure was appropriately adjusted for the presence of migrant workers, then Qatar might rank near Norway.

## Introduction

Starting from '90, human development and governance are characterizing the theoretical and political paradigm on transformational paths of the economy and the related wellbeing of the population, alternative to the mainstream models of growth to their trickle down distributive mechanisms. As multidimensional, anthropological founded and place-based, they open the doors to multiple intangible factors. Their nonlinear and embedded linkages are mutually complement in order to decode the determinants/obstacles and the intrinsic goals of these human development paths. In this integrated and complex framework, even if neglected for many decades, religion plays again a relevant role in the economic literature and in the arena on global scale (Deneulin and Rakodi 2011) since it tries to keep together values (preferences) and practices (actions), assumed as dichotomous by the mainstreaming neoclassical economics. The many feasible intersections between human development paths, governance's rules, and religious traditions – as either virtuous or vicious circles – represent a new ontological-theoretical domain that is challenging the academic fields separation and, in turn, is

feeding cross-fertilization among disciplines (development economics and religion economics, theology and moral philosophy, political science, and public philosophy) and methods (quantitative, qualitative, and experimental). Heterogeneous strands of literature suggest theoretical lenses for these interactions, that is, the New Institutional Economics *a là* North and *a là* Aoki – where religion is defined an encompassing set of rules and/or of organizations – and the Capability Approach *a là* Sen – where human development is defined as human flourishing according to the personal values and implemented in relational and communitarian ways. Overlapping these strands, Faith Based Organizations (FBOs) might play as an intermediate institution between the State and the individuals, aimed at promoting voice and participation of different communities and groups – according to their theological roots and goals – to channel their values and rituals, and following partnership's rules with other agencies likes as humanitarian agencies (secular and religious) and with bi-multilateral donors (Thaut 2009). Furthermore, the sustainability dimension could be a bridge between human development, religion, and governance if religion matters both as resources – from meso- to macrolevel – and as goals – from macro- to microlevel. FBOs could be a bridge toward sustainable human development (Anand and Sen 2000; Garofalo et al. 2018), designed to combat deprivation in poor countries but also to fulfill SDGs on global scale (Tomalin et al. 2019).

In terms of structure, the first section "Overview: Theoretical Approaches on Religion and Human Development" refers to interdisciplinary literatures. The second section "Faith Based Organizations: From Humanitarian to Developmental Purposes of Service" discusses the active role of FBOs in humanitarian assistance, social service, international cooperation, and peacebuilding. The third section "Analysis of the Political-Economic Role of a FBO: The Pentecostal Movement in Uganda Regards Realizing Sustainable Development" discusses the economic and political roles that religion might have at local level. In the conclusive section, open questions for future research are presented.

## Overview: Theoretical Approaches on Religion and Human Development

If "religion" and "human development" literatures would be crossed, then the emergent core would be on the multidimensional and intersubjective wellbeing: religions is a device to recognize and sustain the "signs of times" of the human integral development in a universalistic way, whether economic development gives temporality to spiritual salvation of a community (e.g., Augustinus; Vatican Council II and following Encyclica). However, there is not yet a predominant paradigm and the history of economic thinking documents that this complex relation is often contested. (i) On one hand it is prevailing a "separation hypothesis": starting from Adam Smith, the separation State-Church and the laissez-faire rules among different religions within a country favor good competition and moderation, beneficial for growth; however, empirical cross countries/religions evidence shows a negative correlation between religion and growth when GDP per capita is increasing (Barro and Mc Cleary 2003). The modernization approach to growth and the correlated ideology of secularism prevent religion to be a positive source (if not an obstacle) and to hamper religious entitlements as communities' goals of development. (ii) On the other hand and in the waves of widespread globalization, the hypotheses "massive growth-declining religion" are not confirmed, showing a resilient ability of religion on global scale (Carbonier 2013). According to World Wide Survey (WWS, 1981-01), religion is related to development level (differentiation) of/within a country: religion is high if the subjective perception of insecurity is high – as in less developed systems – and if inequality is high – also in developed systems. However, as underlined by Deneulin and Rakodi (2011) in their empirical analysis based on WWS, religious-inspired behavior and perceived benefit from sacral ritual participation are consistent with a positivist approach (Mc Clearly and Barro 2019). In other words, they do not consider the "contextual nature and the meaning giving of religion" (Deneulin and Rakodi 2011, p. 48). World Bank (1980) dedicated a special issue to "Religion and Development";

for *Voices of the Poors* (WB, 2000) sacral spaces and leadership of FBOs matter for an holistic vision of development; the partnership of national/multinational development agencies (WB, UN) with FBOs is increasing and, among other institutions, the Department "Development Dialogue on Values and Ethics" (WB, 2005) is aimed to better explain and sustain nexus between faith, ethics, and services provision. Another methodological question is regarding the nature of the linkages "religion- economics," for example, if one way or two ways. Welch and Muller (2001) disentangle four topics on that matter: (i) no preference for interaction between religion and economics (*any* religion could be consistent in principle with *any* economic action); (ii) economics in service of religion (economics could implement specific religious beliefs and practices); (iii) and vice versa – subjective religious rules, as trust or moral community condition may support interest of a specific group; (iv) complementarity between religion and economics (inclusive aspiration to common good and "human perfectibility" (*Fides and Ratio*, 1998; Oslington 2000). Specifically, the two-ways interaction could play as follows: (i) *From development to religion*, the wealth accumulation is negative correlated with religion if the increasing job and leisure opportunities crowd out ritual participation (activities time consuming) which opportunity costs became relatively increasing. Whether the impact of education is negative on religious values, because "believing" became less attractive with respect to rational choice model, and positive on the rate of ritual participation, because of the perceived benefits from network, for example, from "belonging" to a church (McClearly 2008; Mc Clearly and Barro 2019; Karacuka 2019). (ii*) From religion to development,* it depends on the level at which occurs: from meso to micro, religion is a channel to shape and transmit extrinsic motivations and attitude (self-esteem, hardworking, volunteering) and reinforcing informal rules (trust, fair distribution); from micro to meso, is a process to accumulate positive immaterial externalities (cooperation and coordination within and among agencies and communities, provision of relational and common goods) or to struggle against corrosive organizations and unjust rules as "structural sin" of an economy (Deneulin 2015). An underlying methodological question is about the feasibility of economic rational model – enriched by ad hoc assumptions, like as in the orthodox economics – as microfoundations of the interactions religion-human development. Considered as a whole, these interactions decode religion as heterogeneous (believing and belonging) and dynamic (meso-/micro-/macrodimensions) and emphasize the idea of religion as an intermediate institution of human development, calling for governance.

## Faith Based Organizations: From Humanitarian to Developmental Purposes of Service

Organizations based on faith play today a critical role as FBOs as human services providers (Yancey et al. 2009) in the delivery of services to the most vulnerable groups of the population globally, putting themselves at service of the community in a dialogue with the individual (the microdimension), the community itself (the mesodimension) and the society with its institutions and governance (the macrodimension of human development). There is not universal agreement on a unique definition of FBOs, a broader definition considers as FBO any kind of faith-related voluntary association from churches, mosques, synagogues to congregations, that, motivated by its religious faith and beliefs, engages in social welfare (McGrew and Cnaan 2006). Other definitions are more restricted in terms of human resources engaged in the service provisions (i.e., volunteers or workers), mission, or type of activities. For instance, Noor and Nawi (2016) refer to FBO as "community service agency which employs qualified community workers and has its identity and mission, self-consciously derived from the teachings of one or more religious or spiritual traditions or is auspice by any religious organization or religious community." Looking at the type of social service they provide, FBOs actions relate to different domains of human service, from humanitarian assistance and life-saving activities (e.g., Samaritan's Purse, Islamic Relief)

to community development (e.g., local congregations and associations). Moreover, they represent at local level values-hub where citizens gather to re-create a sense of community devoted to the most fragile. FBOs present different organizational model on the basis of several factors at strategic and operational level, with formal and informal ties embedded in the society where they operate. Moreover, FBOs might be characterized by some features of secular NGOs such as independence, being a non-for-profit and intrinsically driven by voluntary and altruistic purposes (Ball and Dunn 1996); however, they differ from secular NGOs for their religious embedment or linkages with a religious structure, doctrine, or community (Clarke and Ware 2015). Today their roles is recognized as a crucial part of the humanitarian and development paradigms in the response to the Agenda 2030 and its Sustainable Development Goals (SDGs). The active engagement in development by many FBOs, despite some debate over the evangelistic goals of some FBOs (Thaut 2009), represents an effective response to the global challenges. On the HIV/AIDS pandemic, for instance, the Community of Sant'Egidio (a network of Christian communities in more than 70 countries in the world based its mission on Prayer, Poor, and Peace) developed through the program DREAM (Disease Relief through Excellent and Advanced Means) effective protocols of prevention and treatment of HIV with innovative sanitary technologies at service to entire communities of 11 countries in Africa. The same institution is active in peacebuilding and peacekeeping activities worldwide, having promoted the peace agreement in Mozambique and being an active as mediator among conflicting parts in Central Africa Republic.

## Analysis of the Political-Economic Role of a FBO: The Pentecostal Movement in Uganda Regards Realizing Sustainable Development

Faith based organizations (FBO) is a term used in reference to the religious actors in development cooperation (Oden and Samuelsson 2019). These have been on the increase in Uganda over the years and currently, FBOs are their presence in every part of the country. Many FBOs often identify with and have inextricable connections with the grassroots, are deep-rooted in the communities, and are in touch with the day-to-day realities in the villages, whether that be social, economic, or political (Auli and Vahakangas 2019). The FBOs have invariably shaped and informed the political landscape and development trajectories of rural and urban communities alike. Economically, Pentecostals immensely help vulnerable members of the community, for instance, through provision of relatively cheap education to underprivileged children as well as conducting religious rituals to resettle former combatants (Sundnes-Dronen 2019). A case in point is the Deliverance Church which through Joy Schools nurtured many influential people who occupy key critical offices. Also, the hospitals have provided much of the needed, relatively cheap, medical care to grassroots communities. Moreover, Pentecostals have set up radio and TV stations across the country through which they communicate developmental messages and social values to the country through the voices of religious leaders who are largely the most rusted members of the community (Narayan-Parker 2000). There are specific development oriented programs such as "Amagezi Bugagga" ("Wisdom is Wealth") that is aired on Impact FM radio at 05:00 am from Monday to Friday. During this time, wealth creating and developmental information is passed on to the listeners. This is a trend that is increasing among the Pentecostals in Uganda and is galvanizing them into getting engaged in developmental activities.

Politically, FBOs particularly Pentecostals through their leadership especially the "prophets" have continued to deploy the power of "prophecy" as a very important avenue for political engagement. No wonder Jakobsson argues that religion is now politicized (2019). Many "prophets," "apostles," and "priestesses" (Robert Kayanja, Samuel Kakande, Imelda Namutebi, etcetera) have attracted an array of prominent high- and middle-class citizenry and political figures because of the perceived capacity to comment on and prophecy on politically sensitive

issues/subjects. A case in point is Prophet Elvis Mbonye who has attracted A-class of Kampala dwellers in five-star hotels for his prophetic services. Prophet Mbonye was mostly pushed into the limelight when he prophesied that Ugandan military choppers will crash in 2012 and then mainstream media reported that he had informed top military leaders about the prophecy but they ignored him (Mulondo 2012). At the time of elections, politicians competing for various political offices often seek the services of Pentecostal prophets as they are believed to have the divine power to prophecy and help people win elections.

Despite these developments in FBOs and Pentecostalism in particular, dissenting voices from within the Pentecostal fraternity are increasing. Cynics many argue that some of the "high-flying" prophets, such as Elvis Mbonye, Robert Kayanja, or Samuel Kakande are merely "political prophets." Yet, FBO and Pentecostalism still holds very strong appeal among Ugandans as seen in the recent past where they were instrumental in bringing various political groups that previously never sat on the same table to define the political landscape and discuss the political direction of the country, to the discussion room. This was evidenced in the last presidential campaigns where the inter-religious Council of Uganda (which also includes Pentecostals), an indigenous national faith-based organization, was instrumental in bringing all the presidential aspirants in one space for the debate. The presidential debate was key in defining the political atmosphere in the country.

Further, many Pentecostals are capitalizing faith-based platforms to indirectly engage in politics, negotiate political leverage, and participate and define the development of the country from within. Some have done so by acquiring direct political representation in platforms such as Local Government councils, the national parliament, among others. For instance, in the 2016 political election cycle, a number of openly confessed Pentecostals were elected to Parliament; these include the once celebrated gospel singer, Hon. Judith Babirye (Woman Member of Parliament for Buikwe district) and Hon. Pr. Peter Sematimba (MP Busiro South). Also, many others are sympathetic to Pentecostal causes such as Hon. Allan Sewanyana (MP Makindye West) who previously worked at a big Pentecostal media brand, Top Media Group (which runs Top Radio and Top TV) to rally support and win. This situation in Uganda is not unique to Uganda. No wonder Jakobsson argues that a campaign without an element of religion is more less unthinkable in diverse countries (Jakobsson 2019). These events show: first, that Pentecostals are increasingly becoming key in decision-making for the country. Second, that Pentecostalism is a vehicle for social and political transformation. Third, that Pentecostals are most likely to become a voting block that will determine political and social trends in the country in the near future. Fourth, formation of the *Born Again Faith Federation* (BAFF), a distinct faith with leadership in every part of the country, and at the same level of the old guards such as Roman Catholics, Anglicans, Muslims, Orthodox Christians, and Seventh Day Adventists, denotes that Pentecostalism in Uganda and is increasingly turning into a major vehicle of political and social engagement.

## Conclusions

The overlapping trajectories between human development, religion, and governance suggest an emergent and complex topic for the economic theory and policy: is *a* religion able to overcome the traditional dualism between preferences – and their underlying beliefs and values – and actions – and their underlying decision making – in different domains of choice? Does a religion provide an element of intersectionality, selected as a socially embedded heuristic for inequalities analysis across countries and religions and furthermore across religious values and rituals of different groups and communities within a country or across different rate of rituals participation within the same religious group? The overlapping trajectories underlined highlight the inadequacies of mainstream economics – designed as a closed system of individual rational choices and of macroeconomic outcomes, assumed to be consistent with the assumption of methodological individualism. The traditional discipline frontiers are

critically discussed and their mutually contaminations are conceptualizing a new core of the economics, designed as an open, coevolving, and value-laden system. That has methodological implications which, in turns, have normative impacts: it regards the pluralism in economics where the rational choice model is enriched by empirical information on religious "beliefs" and "belonging," still anchored to an empiricist-positivist approach. The main underlying question is about the intersubjective meaning's construction of "religion" and about its role as an institution within the inter-institutional play for the governance of human development paths. Open questions are related to the term of pluralism: if "pluralism" has a ontological dimension – because any reality is shaped by interplaying entities – then the pluralism requires a meta-methodological discussion on how to build and use knowledge (Dow 2012) and on the added value of an hermeneutic approach and of an "incomplete thinking" (Pope Francis) with respect to the positivistic approach. According to Kanbur and Shaffer (2006), the normative nature of an epistemology allows to go further in interpreting and governing vicious or virtuous circles between religion(s) and human development paths in a multidimensional and sustainable perspective where religious organizations are active social service providers and may play political and economic roles.

# Human Ecology: Integrating Urban and Natural Environments

Russell J. Fricano
Urban & Regional Studies Institute, Minnesota State University Mankato, Mankato, MN, USA

## Synonyms

Agroecology; Biophilic cities; Eco-development; Ecotone; Green building; Green infrastructure; Sustainable development

## Definition

Human ecology is a study of the relationship between human development and the natural environment. This field examines reciprocal relationships between social, economic, and cultural aspects of human settlement, how humans shape the natural environment, and how the natural environment shapes human settlement and activities. In this manner, human and natural environments are not assessed separately; they are examined together.

## Introduction

The origin of human ecology can be traced to ancient times. As early as the fifth-century BCE, Hippocrates admonished ancient Athenians of adverse health-related impacts of locating cities on marshy and damp land and the benefits of development on sunny and windy slopes. Later, Roman architect Vitruvius advised city builders to design cities with buildings and streets that harnessed sunlight and wind patterns. These concepts were carried over into the Renaissance with Alberti and Bacon advising designers to respect nature rather than ignore it. Resource depletion and pollution spurred by industrialization brought further attention to these views in the nineteenth century and spurred two movements: Arcadian and Imperialist. Arcadians advocated preservation of the environmental resources, such as the establishment of the US National Forests and Parks. Imperialists viewed nature as subservient to humankind in terms of the service nature provides; for example, forests provide lumber; rivers provide hydroelectric power. The most influential planners and architects of the nineteenth and twentieth centuries took a middle ground between these approaches, integrating nature and human settlement. These include Frederick Law Olmsted, Patrick Geddes, Lewis Mumford, Kevin Lynch, and Ian McHarg (Spirn 1985).

Michael Colby (1991) extended and formalized the interrelationship of humankind and the environment by classifying paradigms illustrating the evolution of environmental management. These paradigms ranged from "frontier economics" that emphasized "infinite growth and prosperity" to "deep ecology," "anti-growth, and constrained harmony with nature" (p. 196). Between these two extremes, he denoted the paradigm of "eco-development." Colby defined eco-development as "co-developing humans with nature" (p. 196), with such a relationship leading to a "positive sum game," in which economic welfare is accomplished in an environmentally sustainable manner (p. 204). Eco-development serves as a foundation for human ecology.

In contemporary times, the fields of urban planning, landscape architecture, and environmental management view the relationship between human development and the environment within the framework of sustainable development. As stated by the Brundtland Commission, the intent of sustainable development is

to meet the needs of the current generation without compromising the needs of future generations (United Nations 1987). The three main components of sustainable development are environment, equity, and economy. In this discussion, society and equity are considered synonymous. Fitting this model to human ecology, the three-nested diagram better portrays this relationship in a more realistic way (see Fig. 1).

The proportions of each facet are depicted at the appropriate scales. The environment is all-encompassing over humankind and nature. Society is the next largest facet and focuses on humankind. The economy is a subset of society. The following section summarizes principles associated with each facet, as outlined by Beatley and Manning (1997).

*Acknowledge fundamental ecological limits:* the preservation of environmental resources promotes biological diversity – the number and geographic distribution of ecosystems, number and geographic distribution of plant and animal species, and genetic variation within each species. Nonhuman species have their own value, independent of any practical value for human beings.

*Restorative and regenerative:* sustainability promotes policies that revitalize a community's economy, restore degraded resources, promote environmentally responsible businesses, and foster agricultural self-sufficiency.

**Human Ecology: Integrating Urban and Natural Environments, Fig. 1** Three-nested diagram of sustainable development. (Adapted from Dushenko et al. 2019)

*Quality of life:* a blend of community characteristics that local residents value. Quality of life is subjective and can range from natural open space and clean air and water to quality educational facilities.

*A sense of place:* community design that enhances local character through distinctive architecture, landscaping and historic buildings and gives prominence to public areas and civic buildings.

*Integrative and holistic:* a comprehensive perspective, with attention directed at the interrelatedness of decisions (i.e., how do land use policies affect preservation of agricultural land? Is enough affordable housing provided?)

*Imply a new ethical posture:* planning should extend its scope to include other issues that affect community welfare: employment, affordable housing, public health, and community food systems.

*Equitable and just:* this principle considers whether officials plan with the public interest in mind and how enacted policies affect the entire social strata of the community (with special emphasis on the disadvantaged). For example, the provision of a mix of housing for low-income employees conveniently located near the place of work reduces the congestion-related impacts of long-distance commuting and provides employment access to the disadvantaged.

*The importance of community:* community provides opportunities for meaningful citizen participation and community design focused around schools and local institutions, with sidewalks and communal areas conducive to interaction.

*A full-cost accounting of social and environmental costs:* sustainable development approaches consider impacts on disadvantaged members of society. Policies that promote economic development of low-income neighborhoods, transportation strategies that provide inner city access to healthcare and suburban jobs, and the environmental justice movement follow this principle.

Ruddick (2016) also integrated landscape architecture with principles of sustainable development, emphasizing restoration, conservation, and regeneration. Restoration involves the use of a narrative, an account of the historical evolution

of a site and its future potential for reviving a lost use or function. Conservation protects and uses less of existing resources. Regeneration allows a natural or man-made process to sustain itself over time.

## Contemporary Human Ecology

### Theoretical Foundations

Human ecology views the relationship of the human organism in its own context in complex systems of environmental, social, cultural, and economic relationships, which can vary and change with time. The goal is to synthesize social and natural sciences. The relationships between humankind and nature are best examined through types of relationships, processes, and scopes in space.

According to Steiner (2016), human ecology consists of three types of relationships: function, structure, and change. Functional relationships consider the flow of natural resources, such as air, water, and minerals, through space. Structure consists of man-made buildings and lots and natural elements such as patches, corridors, and matrices. Dynamic relationships reflect changes over time. These concepts are useful in examining how systems interact and vary over space and time. The scope of human systems ranges through habitat, community, landscape, region, and nation-state.

The most basic level of human and nonhuman settlement is denoted as "habitat." At this level, the establishment of habitats forms a "niche," based on culture and context. Niches are conducive to interaction and can vary based upon cultural and environmental settings. Spatial areas where humankind and nature overlap are ecotones, which promote richness in diversity (Steiner 2016).

At the next level, communities are places where humankind and nature interact defined by space with diverse, interdependent, and whole systems (Steiner 2016). Communities are comprised of human society and natural systems. Human communities consist of shared beliefs, interests, and commitments of varied groups and activities (Selznick 1996). Ecosystems consist of biotic and abiotic resources and man-made structures. Living resources including vegetation, animal life, and microorganisms are biotic; abiotic resources are air, water, and soil (Marten 2001).

Landscapes comprise the next highest level. Landscapes are all natural and manmade features that can be perceived by the eye. Landscapes consist of mosaics that have diverse structures and functions and adapt to change in various ways. As diversity results from natural and cultural forces, adaptation of landscaping is a cultural undertaking. Landscapes must be viewed as a layering of social and environmental features that serve as settings for dynamic relationships. Landscapes are more about process than place, involving "interaction and integration" (Steiner 2016, p. 85). Steiner also noted that landscapes must be actively observed, as they represent symbolic meaning and provide ambiance.

At the regional level, human ecology integrates regional types, structure, and complexity. As natural resources such as airsheds, waterbodies, or wildlife corridors do not follow jurisdictional boundaries, human ecology leads to regional planning. Finally, at the nation-state level, as nation-states are primarily human relationships, discerning ecological relationships becomes more challenging. Diversity exists between nation-states as well as within them. Ecotones between nations can result in unique cultures.

Human ecology also involves a careful and enriching overlap and interaction in ecotones and edges. Steiner (2016) observed that ecotone areas and development along edges have a special richness. An ecotone can be a waterbody that provides recreational use and also serves as a habitat for riparian plants and wildlife. The Pueblo cliff dwellings in Mesa Verde National Park are another example. An edge defines boundaries of open space or natural areas due to the contrast between human development and natural areas. Central Park in New York City is a prime example. Ruddick (2016) added to this interrelationship between the human and natural environments by allowing innovative patterns that can be defined at various spatial patterns from the site to the region.

## Related Concepts

### Biophilic Cities

A biophilic city seeks closeness to nature through preservation and enhancement of existing natural characteristics. This approach protects and nurtures the environment through an understanding that abundant wild nature is important. Such a city also actively restores and repairs adversely impacted natural resources. Biophilic cities also find new and creative ways to insert nature into streets, buildings, and urban living environments. Urban forestry, which manages and enhances tree populations in cities, follows this principle. In the process, biophilic cities enhance livability through an outdoor orientation that makes walking, strolling, and daily exposure to the outside elements and weather a priority (Beatley 2011).

### Bioregionalism

Bioregions are areas characterized by unique resources such as watersheds and forests. Each resource impacts the others and is affected by the others. Bioregions exist irrespective of jurisdiction and each is distinct. Citing Peter Berg's conception, Glotfelty (2015) noted that the goals of bioregionalism are to "restore and maintain natural systems," "meet basic human needs in a sustainable manner by relying as much as possible on local materials and resources," and support those engaged in sustainable development (Glotfelty 2015, p. 3).

### Agroecology

Agroecology integrates ecological processes with agricultural production. Under this concept, a site or region of agricultural production is viewed holistically as an ecosystem. The goals are to make agriculture and natural factors work together simultaneously and synergistically. Agricultural management begins with a perspective of farm systems as a whole and designs intervention according to the impact on the entire system (Gliessman 2015). Some examples include organic farming, which promotes natural fertilizer and pest control, leading to higher yields without detrimental impacts on pristine natural areas. Also, the application of microclimates, planting trees or other forms of vegetation that protect agricultural production from climate-related impacts, follows agroecology principles.

## Human Ecology in Practice

Contemporary development practices have enabled the integration of human and natural environments. This can be conducted by utilizing and enhancing existing natural resources within the surrounding context and designing manmade structures with minimal environmental impacts. The following are selected examples from the fields of urban planning, environmental management, and building and landscape architecture.

### Conservation Subdivisions

Conservation subdivisions employ zoning and land division regulation to preserve interconnected areas of open space, steep hillsides, floodplains, and other areas for conservation, avoiding resource fragmentation. This is done through a four-step process: (1) identifying primary and secondary conservation areas, (2) locating housing sites and related infrastructure, (3) aligning streets and trails, and (4) drawing lot lines. For example, designers cluster building lots together to avoid areas with sensitive environmental resources. In this manner, the location of environmental resources ultimately guides development (Arendt 2015).

It should also be noted that environmental resources are determined by natural rather than manmade boundaries. Watersheds and sensitive wildlife habitat areas extend beyond local jurisdictions and can only be viewed from a regional perspective. Development at the local level can destroy the integrity of these areas. Environmental review and planning should be extended to a regional scale to effectively preserve natural areas (Barnett 2020).

### Overlay Zoning

Overlay zones provide supplemental regulation in areas with sensitive environmental resources which were subdivided and developed prior to current land use and environmental regulation. These are special zones imposed over existing

zoning districts to provide an additional layer of development standards to protect environmentally sensitive areas from detrimental land use practices. Examples include setbacks from riparian areas, shielding of lighting near wildlife corridors, prohibition of invasive plant species and use of herbicides and pesticides. This allows permitted development to exist unobtrusively within the environmental context.

### Green Building

Green building is a program of various building standards and design strategies that implement sustainable development principles. These standards primarily focus on reduction of greenhouse gas emissions, natural resource and energy consumption, water usage, air pollution, and waste disposal. Green building strategies are also intended to be implemented in a cost-effective fashion.

Green building programs are developed and administered by the US Green Building Council (USGBC). The USGBC developed the LEED® Rating System for evaluating how well green building practices are implemented in buildings and neighborhood development. LEED® is an acronym for "Leadership in Energy and Environmental Design." This rating system promotes tangible and intangible benefits of green building practices including environmental, economic, and social benefits over the life cycle of buildings. LEED® also provides a comprehensive portfolio of building programs and innovative technical tools to serve the real estate industry. The USGBC also strives to earn widespread and routine endorsement by private and public real estate industry leaders and stakeholders (U.S. Green Building Council 2020).

### Transect Planning

Transect planning is a New Urbanist approach that classifies all elements of the urban setting by defining and setting a scale of development intensity in delineated "transects" from rural to urban. Designers and planners account for the local landscape, architectural design, uses, height and bulk of prevailing structures, and integration of new structures to be consistent with prevailing development patterns.

Transects also correspond to "ecozones" that define characteristics of land use intensity. Duany and Talen (2007) denoted six ecozones. Ecozones range from pristine "rural preserve" to highly urbanized "urban core." Figure 2 depicts a diagram of a transect system. Characteristics of each ecozone are also listed in Table 1.

The main premise of transect planning is that planning must be based upon a balance between natural and manmade environments. In contrast to the traditional concept that development and nature are diametrically opposed, transect planning integrates both systems using the following ecological principles:

*Sequence of habitats or ecosystems:* a spatial ordering or progression of biodiversity. Various forms of human habitat have different levels of urban intensity.

*Linkage between organisms and their physical environment:* connecting elements of development such as structure or lot size with the prevailing physical environment.

*Internal diversity:* different habitats exhibit a different mix of elements to satisfy a particular living preference. This is referred to as "complexity."

Ecological principles work simultaneously, but in different ways and at different scales. This principle acknowledges that natural processes such as migration or feeding flow across different spatial scales. Under these circumstances, planners must keep scales in mind to develop the most appropriate solution to environmental problems (Duany and Talen 2007). Transect planning is implemented through form-based codes.

Transect planning integrates urban form with architectural design and open space by providing an orderly perspective in its continuum of urban and natural areas. However, most regions do not follow the ideal transect pattern with development established before the transect concept became adopted. This can make delineation and classification of ecozones subjective (Berke et al. 2001).

**Human Ecology: Integrating Urban and Natural Environments, Fig. 2** Diagram of a transect system. (Source: Duany and Talen (2007))

## Sustainable Agriculture

Sustainable agriculture promotes farming that protects natural areas adjacent to or in the vicinity of agricultural production. This approach also reduces greenhouse gasses and conserves energy. Agroecology is in contrast to large corporate

**Human Ecology: Integrating Urban and Natural Environments, Table 1** Ecozones

| Ecozone | Characteristic |
|---|---|
| Rural preserve | Space legally protected from development in perpetuity; includes surface waterbodies and wetlands |
| Rural reserve | Open space not yet protected from development but should be; includes flood plains, steep slopes |
| Suburban | Most naturalistic, least dense residential habitat; consists of single-family residential, with open space; is rural in character; restrictions on nonresidential development |
| General urban | Primarily residential; single family-detached and row houses; limited office and retail with open space consisting of greens and squares |
| Urban center | Denser, mixed-use habitat; row houses, apartments, offices above shops, with office and retail permitted. Open space consists of plazas and squares |
| Urban core | Densest residential, business, cultural, and entertainment concentration; row houses, apartment buildings, department stores, and office buildings. Open space consists of squares and plazas |

Source: Duany and Talen (2007)

farming that transports agricultural goods across the country. Two prominent sustainable agriculture approaches are organic farming and urban agriculture.

### Organic Farming

Organic farming involves environmentally friendly practices that reduce pollution impacts, promote biodiversity, and conserve and manage natural resources. According to the US Department of Agriculture, organic farming involves the following practices:

> "Use of cover crops, green manures, animal manures, and crop rotations to fertilize the soil, maximize biological activity, and maintain long-term soil health";
>
> "Use of biological control, crop rotations, and other techniques to manage weeds, insects, and diseases";
>
> "An emphasis on biodiversity of the agricultural system and the surrounding environment";
>
> "Using rotational grazing and mixed forage pastures for livestock operations and alternative healthcare for animal well-being";
>
> "Reduction of external and off-farm inputs and elimination of synthetic pesticides and fertilizers and other materials, such as hormones and antibiotics"; and,
>
> "A focus on renewable resources, soil and water conservation, and management practices that restore, maintain, and enhance ecological balance". (U.S. Department of Agriculture 2007)

### Urban Agriculture

Urban agriculture is the cultivation of crops and livestock within cities or on the urban fringe. In addition to supplementing the urban food supply, urban agriculture has also been recognized as a planning strategy that provides social benefits and entrepreneurial opportunities in inner-city areas. The devotion of a portion of urban land to agricultural use provides access to agricultural produce to supplement the diet of urban households. Urban agriculture also promotes recreational opportunities through gardening (Hodgson et al. 2011). On larger landholdings, urban agriculture promotes entrepreneurial opportunities for selling produce in urban markets and creating agricultural employment (Kaufman and Bailkey 2000). As a green form of open space, urban agriculture has been identified as a strategy which reduces the amount of greenhouse gases associated with global warming (Lal 2004). Peri-urban farming that serves an adjacent area reduces greenhouse gas emissions and transport costs posed by long-distance transport, in addition to reducing time and distance in transporting perishable produce (Heimlich and Barnard 1992).

Establishing and maintaining urban agriculture poses a number of challenges. Most urban farming is practiced on temporary lease holdings of private or public land. From an economic perspective, urban agriculture is not considered the highest and best use of land; a private landowner may use it as a place holder until the market is favorable for new development. Even if the lease holding is on public land, urban agriculture competes with other forms of public land use such as urban forestry, parkland, or redevelopment projects. These issues can be addressed by acquiring urban farming sites through land trusts and implementing ordinances and policies that promote urban agriculture use. Local and regional

governments should also work closely with food policy councils and urban farming advocates.

## Green Infrastructure

Green infrastructure, also referred to as "low-impact development," uses natural resources and processes rather than conventional construction methods and materials to accommodate the environmental context. The development of Woodlands, Texas, avoided the impacts of stormwater runoff and subsidence posed by concrete ditches. Designers used an alternative system of natural drainage that included ponds, landscaped flood plains, and well-drained soils (Spirn 1985). Green infrastructure also includes best management practices (BMPs) that address stormwater pollution in a natural manner. For example, rain gardens provide vegetative buffers along sidewalks, parking lots, and roadways that can absorb stormwater, which is then filtered into subsurface soil or sand (See Figure 3). With the appearance of natural ponds, detention basins with soft aquatic bottoms also capture stormwater for treatment or subsurface filtration (U.S. Environmental Protection Agency 2005).

Despite the benefits of green infrastructure, the major challenge to its practice is what Randall Arendt refers to as "the status quo option of doing nothing" (Arendt 2010, p. 11). Traditional suburban subdivision design promotes standardized "cookie-cutter" development that does not consider natural and cultural features of the landscape. Antiquated zoning regulations are also not sensitive to environmental resources. Further, subdivision regulations focus on gray infrastructure of streets and sewer lines with lot configuration usually determined by surveyors and engineers with no background in environmental design. These challenges can be rectified by conducting an inventory of existing resources and using an existing resources/site analysis (ER/SA) map. The ER/SA map can serve as an evaluative tool to identify land suitable for development, as well as natural resources to be conserved (Arendt 2010) (Fig. 3).

**Human Ecology: Integrating Urban and Natural Environments, Fig. 3** Rain gardens filter stormwater with native vegetation and add aesthetic appeal to a property. (Source: Minnesota Pollution Control Agency)

### Eco-towers

Human ecology can also be employed through manmade construction that would normally be associated with highly urbanized areas. Eco-towers follow human ecology principles using new technology and care in design and construction practices. This includes environmentally friendly building processes both inside and outside the building. Eco-towers also have cultural significance. Eco-towers design follows LEED® guidelines and related architectural design and engineering principles. Eco-towers employ human ecology principles in a direct and indirect manner. The following principles of eco-tower design and construction are outlined by Al-Kodmany (2015).

Direct benefits are gained by applying microclimate principles and other types of environmental mitigation. This includes vegetative planting on rooftops and sides of buildings that reduces the heat island effect. The *Bosco Verticale* ("vertical forest") in Milan, Italy, is a prime example. Agricultural towers such as *PlantaSymbioSystem*® in Stockholm, Sweden, produce crops and organic materials, consume carbon dioxide, and rely on heating from adjacent buildings and a biogas plant. Agricultural waste products from this project are used for biogas and fertilizers.

Eco-towers can also facilitate wind patterns and mitigate light and shadow impacts using building configuration and setbacks. Lighting controls can adjust to daylight and harness natural sunlight.

Indirect impacts save energy. Eco-towers conserve energy by using sustainable technologies including wind turbines, solar panels, and sunlight-sensing LED lights. Daylighting utilizes direct sunlight through internal and external reflection to illuminate and warm buildings. Cross-ventilation also conserves energy.

Eco-towers also conserve natural resources sustainably by utilizing local building materials. This practice saves energy required to transport the materials and promotes local economic development. The use of recycled building materials also conserves natural resources. Green materials including wood, masonry, or concrete conserve energy through thermal mass properties. Water conservation measures such as rainwater catchment and water recycling can also be incorporated in eco-tower design.

Eco-towers also promote the human side of human ecology through designs promoting interaction and a sense of place, with structures that serve as cultural icons. Eco-towers are configured to form open areas and "urban rooms," where people meet and interact. The location of a tower in a central business district can also provide a "Zone of Influence" within the vicinity of the structure. Eco-towers also serve as icons representing the interface of humans and the environment. Shanghai Tower signifies the importance of China as an economic superpower. The Arab-Islamic culture influenced the design of the façade of the Doha Tower in Qatar.

As eco-towers have become increasingly popular, this form of development has also received its share of criticism. The main issues relate to the effectiveness of green building guidelines and financial feasibility. Some architects and researchers have questioned whether LEED®-certified buildings have achieved sustainable outcomes; in this manner, critics contend that the LEED® rating system is based upon projected outcomes rather than actual performance (Mehaffy and Salingaros 2013). However, variation in building usage and maintenance defies an accurate comparison between LEED®-certified and conventional building performance.

Financial feasibility is based upon how development and operating costs are calculated. While development costs are based upon materials and labor, operating costs are more difficult to estimate. Operating costs are normally estimated over a 30-year time period; however, for eco-towers that use high-quality building material and technology, a 50-year time frame would be more appropriate (Al-Kodmany 2015).

## Conclusion

Human ecology's theoretical foundations and practice provide critical guidance. This concept acknowledges that human settlement and nature are not separate, but located within the same all-encompassing environment. Human ecology is

also consistent with principles of sustainable development and recognizes a rich overlap and interaction of society, culture, and environmental resources through ecotones and edges. In the process, human ecology also allows for dynamic and innovative patterns that can be defined at various spatial patterns from the habitat site to the region.

In practice, human ecology promotes solutions with a holistic perspective, using both natural and manmade systems. Sustainable agriculture, green infrastructure, and similar methods utilize nature responsibly to fulfill human needs. Conservation subdivisions, transect planning, and overlay zones use nature to govern development patterns. Green building and eco-towers can conserve resources, utilize technology, and harness natural systems. These benefits can be attained in direct and indirect ways: direct in terms of enhancing the natural and human environment and indirect by reducing natural resource consumption and waste.

At a time when government decision-makers grapple with the perplexing issues of climate change and resource depletion, human ecology provides hope that humankind and nature can coexist in enriching ways.

# Human Relations Theory of Organizations

Scott Cooley
Department of Political Science, University of Chicago, Chicago, IL, USA

## Synonyms

Employee satisfaction; Informal networks; Social relations

## Definition

Human relations theory: a school of organizational thought which focuses on worker satisfaction, informal workplace organizations, and a means of influencing employee productivity. Unlike scientism, human relations theory does not view workers as essentially interchangeable parts.

## Introduction

The human relations theory of organizations has three main components. First, the theory places an emphasis on the importance of the individual. A worker is not simply a cog in a machine but an idiosyncratic individual who responds to his or her environment. Maximizing the productivity of workers requires taking these individual characteristics into account. Second, human relations theory takes into account the informal organizations in the workplace. What is important to a worker – and what influences her productivity level – may not be the official organizational chart but her or his associations with other workers. Third, human relations theory stresses the importance of participative management. Employees are more likely to be happy and engaged at work if they have meaningful input into important workplace decisions. Failure to solicit employee input leads to unhappy workers and diminished workplace productivity, according to human relations theory.

## Background

Human relations theory first came to prominence in the 1930s in response to the then prevailing management theory, scientism. The inventor of scientism, Frederick Winslow Taylor, held it was not important to consider the feelings and preferences of workers. Rather, in his classic treatise, *The Principles of Scientific Management* (1967), first published in 1911, Taylor wrote that worker productivity could be optimized by conducting a series of time-and-motion studies to reveal the best way to perform a given task. Once the optimal work process was designed, Taylor believed that managers should focus on training workers to complete the task in precisely that way. Taylor clearly did not believe that most workers were very bright, nor did he think they needed to be, writing: "This work is so crude and elementary in its nature that the writer (Taylor) firmly believes that it would be possible to train an intelligent gorilla so as to become a more efficient pig-iron handler than any man can be."

Underlying the management philosophy of Taylor and other believers in scientism were some fairly cynical views about human nature. According to Douglas McGregor (1960), proponents of scientism believed the following about human nature:

1. The average human has a dislike of work and will avoid it if she can.
2. Because most people dislike work, they must be coerced, controlled, directed, and threatened with punishment to compel them to achieve organizational goals.

3. The average person has little ambition, prefers to avoid responsibility, enjoys being directed, and places security above all other goals.

## Hawthorne Studies

By the 1920s, then, scientism was the dominant management philosophy. In an effort to test means of improving productivity, managers at General Electric's Hawthorne Works plant in Cicero, Illinois, began varying working conditions to test their effects on productivity. For example, they adjusted the plant's lighting both up and down. What they discovered surprised them: Whether the plant's lighting level rose or fell, worker productivity levels increased – but only temporarily. The principles of scientism clearly did not explain these aberrant research results.

Perplexed by their findings, the Hawthorne management team invited Elton Mayo, a professor at the Harvard Business School, and a team of researchers to attempt to make sense of their findings. Mayo and his colleagues conducted a series of additional studies which led them to believe that previous researchers had understated the importance of individuals and informal social networks in generating companies' productivity levels. In short, the productivity level of workers at the Hawthorne plant could not be understood by simple time-and-motion metrics or the manipulation of financial incentives or other workplace conditions.

One such Hawthorne experiment was the so-called relay-assembly test-room study, which tested a variety of changes in working conditions. Essentially Mayo, his research team, and the plant's managers introduced a series of changes to the working conditions of a small group of female employees. Each of these changes was discussed with the team prior to implementation. Over time, these numerous changes resulted in increases in worker productivity. In addition to producing more, the workers in the study were happier and more content: "…experimental-group members reported less fatigue and greater satisfaction with their jobs than did their counterparts operating under conventional conditions in another part of the plant" (Miles 1980). This was true even when the original pre-study working conditions were restored. Per Mayo (1946): "…the itemized changes experimentally imposed…could not be used to explain the major change—the continually increasing production."

After years of subsequent research and analysis of the relay-assembly test-room data, Mayo and his team concluded that the explanation was that the workers became an autonomous work group that set its own lofty standards. Put simply, workers had established an informal organization that dictated acceptably high output levels. Pugh and Hickson's summary of the relay-assembly test-room study was as follows (2000): "Mayo's generalization was that work satisfaction depends to a large extent on the informal social pattern of the work group. Where norms of cooperativeness and high output are established because of a feeling of importance, (the workers') physical conditions have little impact." According to Wren and Greenwood (1993), "The group was able to build an internal equilibrium that allowed it to produce more despite the manipulation of rest pauses, length of work day, payment schemes, and so on."

With respect to the importance of informal social networks, Mayo and his team replicated their findings in a separate experiment, called the bank-wiring room study. In this study, 14 men were observed to determine how quickly they could attach wires to telephone parts. Even though the workers had a piece-rate wage incentive plan, which the company thought would incent them to produce as much as possible, Mayo found that the "informal social structure" influenced the productivity and attitudes of workers. In short, the introduction of a generous incentive pay play had no impact on worker productivity levels.

The findings of the bank-wiring room study repudiated a basic tenet – the motive of self-interest – of the scientific management school. Instead, Mayo and his colleagues found that worker production was governed by a series of informal norms and group sanctions. The workers, who in this test were all men, had an idea what a "fair day's work" was, according to Mayo, and the group ensured that this output

target was met – but not a bit of "extra" output was produced. "Overproducers" were labeled "rate-busters" and were made the subject of verbal and even physical abuse. "Underproducers" were called "chiselers," and "members who reported information to management that tended to threaten the integrity of the social system were categorized as 'squealers.'"

As a result, according to Miles, ". . ..the bank-wiring room observation study brought into serious question the simple assumption of rationality based on self-interest that formed the cornerstone of the scientific management school. There appeared to be no simple and direct relationship between technical alterations (in general conditions, work methods, and so forth) and worker productivity." Rather, the important finding was that the informal expectations of the group governed productivity levels.

While the male bank-wiring room group produced a moderate amount and the female relay-assembly test-room group achieved higher levels of productivity, Mayo and his colleagues did not attribute this difference to gender. Rather, as Sonnenfeld (1985) noted, Mayo et al. developed five strategic conclusions from their work:

1. Individual work behavior is determined by a complex set of factors.
2. The informal or primary work group establishes norms, including for production levels.
3. Job-related symbols of prestige and power are key to maintaining the social structure of these informal groups.
4. To maximize employee happiness and productivity, supervisors need to understand the unique needs of each individual.
5. Awareness of employee sentiment and employee participation can enhance receptiveness to workplace changes.

Other scholars subsequently replicated Mayo's findings in various environments. In one such instance, the US government hired psychologist Kurt Lewin (1958) during World War II to determine effective ways to change people's meat consumption patterns. Due to the war, there was a scarcity of the higher-quality meats that people generally ate, but there was an abundance of nutrition-rich, lower-quality meats, including beef hearts and kidneys. Lewin and his research team hypothesized that if housewives could discuss preparing nontraditional meats, they would be relatively likely to curb their consumption of higher-quality meat. He further hypothesized that housewives who merely saw a presentation emphasizing the importance of cutting meat consumption, as a way of aiding the war effort, would be less likely to change their food preparation behaviors. Overconsumption of meat was a difficult problem for the government to solve because women felt social pressure to serve meat, especially to guests. However, Lewin was able to confirm his hypothesis that allowing women to discuss the issue would make them more likely to comply with the government's request. As Lewin noted, "A follow-up showed that only 3% of the women who heard the lectures served one of the meats never served before, whereas after group decision (the group discussion), 32% served one of (the nontraditional meats)." Similarly, in a study conducted in a pajama factory, Lewin found that employees were more likely to espouse new work methods if they were able to discuss them and have input into them. In short, Mayo, Lewin, and other human relations theorists maintained that workers – humans, really – want to have a voice and provide input in their tasks.

Not everyone agreed with human relations school's findings, however, with scientism continuing to have a significant number of adherents. Indeed, organizational researchers split into two warring camps, with some defending Taylor and others promoting Mayo's research. By 1960, the split was so pronounced that McGregor called the technically oriented scientific management approach "Theory X," while he said "Theory Y" was the school of thought which emphasized informal social structures. Apparently the two camps interacted with each other only infrequently.

Mayo's critics were not solely acolytes of Taylor, however. Some scholars believed – and continue to believe – that Mayo made fundamental errors in interpreting his research findings.

For example, Landsberger (1958) argued that instead of observing the effects of informal social

networks, Mayo simply documented the response of workers to having researchers watch them. In other words, worker productivity was affected not by workers' involvement in discussions about working conditions, or by informal social networks, but because the employees reacted to the increased attention from those conducting the studies. Workers simply were not accustomed to being asked for their opinions about important work issues. In Landsberger's account, this reaction to the researchers prompted the changes in productivity, an outcome dubbed the "Hawthorne effect."

Greenwood et al. (1983) found that pecuniary considerations led to the workers' improved productivity. Indeed, when questioned 50 years after the experiments, surviving participants said that the potential to make more money had led to their increased output. Greenwood, et al. concluded: "To say that money was not a major motivator would be an inaccurate conclusion to be drawn from the Hawthorne tests."

More recently, Stephen A. Levitt and John A. List (2011) have contended that Mayo simply misanalyzed some of his data. Levitt and List found and reanalyzed original data from the illumination experiments that scholars thought had been lost. In particular, they rebut the notion that productivity increased or decreased because of changes in lighting levels. In the original illumination experiments, the lighting was manipulated on Sundays, a nonwork day. As it turns out, Levitt and List demonstrate that productivity was simply higher on Mondays, the first day of the work week, regardless of whether the lighting was adjusted. They concluded that "Existing descriptions of supposedly remarkable data patterns prove to be entirely fictional."

## Conclusion

Regardless of likely methodological problems with some of the studies that gave rise to human relations theory, that school of thought continues to have a significant impact on organizational thought. Indeed, it is hard to imagine a modern manager in almost any organization claiming that she need not pay attention to an employee's individual needs or to informal social networks in the workplace. Mayo's work on the importance of supervisor-subordinate communication also has continuing relevance.

More recently scholars have bridged some of the gap between the scientism and human relations schools. Miles writes that systematic studies have shown that neither scientism nor human relations theory is universally applicable. Indeed, "Attention should be given to both because of their interdependence in complex organizations." Once in separate warring camps, defending Theory X and Theory Y, scholars have now combined these schools of thought in an approach to explain employee behavior in complex organizations, called the "sociotechnical" approach.

Human Resource Information Systems; Human Resource Information Technology; Human Resource Management Systems; Integrated Human Resource Information Systems.

## Brief Definition or Concept Description of Human Resource Information Systems

Human resource information system (HRIS) may be defined as integrated computer systems designed to execute multiple tasks in regard to the flow of information within organizations as it pertains to its human resources. HRIS have the capacity to manage such data with functionalities around acquisition: storage, analysis, manipulation, retrieval, dissemination, and control.

## Introduction: Background and Overview

Information and communication technologies (ICTs) such as human resource information systems (HRIS) are gradually evolving and transforming government services. These technological forces are making inroads externally in concurrence with other environmental influences as well as internally within public organizations. Their ultimate impacts are being felt in almost all aspects of government operations which include but are not limited to system changes; employees' work designs; employees' knowledge, skills, abilities, and aptitudes (KSAAs); and the manner in which public administrators and managers lead and how they make decisions. In particular, HRIS are changing and reshaping critical functions, activities, and processes for public human resource management and for employees at all levels (Hussain et al. 2007; Kassim et al. 2012).

Historically, the old personnel administration, hereafter called personnel, was narrowly tailored to a strict "record keeping and file clerical" (Ivancevich 2013) functions. It was also streamlined to function within bureaucratic organizations with top-down hierarchical structures and fragmentation due to the diffusion of authority levels. Personnel also viewed employees narrowly and restricted their development to some employees and not all employees. Overall, personnel as an approach to administration focused more on manual and mechanical strategies for adoption which were limited to sustain and maintain the capacity of information loads and work that currently exist in public organizations.

A more recent approach promotes a strategic view of human resources hence the term, strategic human resource management (HRM). This contemporary change has revolutionized the field with a profound orientation toward meeting the needs and concerns of employees as human resources. Unlike personnel's narrow scope, strategic HRM has a broad focus which is future oriented, global, and results driven and is inclusive of all employees as assets and resources. Such a shift is indicative of the need for public organizations to manage effectively the rate of responses in service delivery and other aspects of their operations where bureaucratic red tape and layers abound. Against this backdrop, strategic HRM is also harnessing ICTs versus conventional methods of administration and management in public organizations. These organizations are embracing the adoption and application of ICTs as simple as the use of personal computers and the Internet to as complex as adopting innovative systems such as HRIS.

This chapter examines the significance, benefits, characteristic features, and usage including the contemporary practices for HRIS within public organizations in their human resource functions and activities. It also assesses some of the major challenges facing its adoption and implementation and provides recommendations as a way forward into the future.

## Conceptualizing HRIS: Significance and Benefits

HRIS may be defined as integrated computer systems designed to execute multiple tasks in regard to the flow of information within organizations as it pertains to its human resources. HRIS have the capacity to manage such data with functionalities around acquisition: storage, analysis, manipulation, retrieval, dissemination, and control. In contemporary settings, HRIS can be used to enhance all human resource functions and activities. Examples of more popular HRIS software used to create greater efficiencies in organizations' human resource (HR) functions and activities include PeopleSoft, Oracle HRMS, SAP HR, and HR Soft (Anthony et al. 2010; Noe et al. 2014).

Thus, the adoption and application of HRIS have facilitated the integration and performance of numerous HRM processes into a single system. Public administrators and managers are using HRIS to transform HRM functions in order to strategically restructure policies, activities, processes, and other procedures. This allows them to stay abreast of the complex demands and challenges in this new era of change. Studies have shown that HRIS can be used in almost all HR functions and activities. In the area of career planning and development, HRIS have been one of the most compelling innovations to influence career management systems with novel instruments (Chakraborty and Mansor 2013). Multipurpose functionalities in this feature include individual customization for persons' career planning and pathing activities. This ultimately impacts organizations' end outcomes such as efficiency gains; quality of work life experiences for employees; and employees' motivation, performance, and overall organizational productivity.

HRIS provide further benefits to HR functions, processes, and activities. For recruitment and selection as staffing and maintenance functions within HRM, HRIS enable more accurate and effective tracking and monitoring of the numbers and types of human resources internal to organizations. When external recruitment and selection are utilized, the same functionalities can be applied.

HRIS enable HR planning and related activities to be strategic in forecasting and implementing planning techniques (Nagendra and Deshpande 2014). Such techniques can be executed through statistical analyses of supply and demand trends which are determined to enhance organizational outcomes. Some benefits noted here are cost-effectiveness, accuracy, and timeliness. It also creates competitive end results for organizations where planning functionalities could be used to diagnose, to monitor, and to track other related HR activities that may be symptomatic of discrepancies within the macrosystem.

Generally, HRIS adoption and implementation offer tremendous benefits for public organizations which were formerly bogged down with paper work, filing, and obsolete systems that could no longer accommodate for the fast pace of change within organizations and their environments. Indeed, HRIS have proven to create data reduction, elimination of redundancy, and attribution for quicker decisions and reduced time lags (Troshani et al. 2011).

Corollaries to these benefits include sound HR decisions that are determined by effective and efficient HR data which HRIS serve to bolster for the development of good organizational decision support systems. This benefit is a direct result of its functionalities within strategic planning which also influences the quality and timing of decision-making processes. Public organizations are constantly faced with unprogammed and complex problems that occur in an environment where change demands may be fast, in flux, and unpredictable. Thus, having HRIS adopted and implemented will drive benefits that are

immeasurable for public organizations, public HRM, and all their human resources.

## Analysis of Public Organizations' Challenges to HRIS Adoption and Implementation

In spite of the many benefits that HRIS present to public organizations, adoption and implementation challenges abound. Numerous reasons are put forward in the literature, but this chapter will attempt to summarize the adoption challenges and implementation risks under three overarching themes. These include challenges which are described as technological, organizational, and environmental (DePietro et al. 1990).

Technological themes honed on the rationale used to frame policies and adopt and implement the same within public organizations. Some of the adoption challenges and implementation risks included system compatibility issues, allocation of resources (this overlaps with organizational factors), infrastructural capacities, system design, maintenance, and complexities within HRIS software selected. System design complexities can be encountered when HRIS are adopted and implemented. Some public organizations experience difficulties especially in large bureaucracies when they purchase systems that are way too complex and difficult to design and configure with other systems (Cats-Baril and Thompson 1995). However, there is the benefit of functionality especially when the system is centrally administered, controlled, and integrated. On the other hand, system design complexities create problems internally for employees who have to learn and work with the system as well as relate it to their institutional frameworks which may not always be compatible with HRIS. There are instances where organizations miscalculate their technological decisions to purchase HRIS that are not compatible with their local or in-house systems. Added problems can be experienced where employees do not possess the technical KSAAs to learn, transfer the new knowledge gleaned, and/or be motivated to produce new knowledge management strategies and learned behaviors (Wiblen et al. 2010; Wilson-Evered and Hartel 2009).

Another example which is linked with technological and organizational factors is the area of allocation of resources, in particular, insufficient projected budgetary allocations. HRIS are exorbitant commitments for a public HRM system to invest in and to implement. Sunk costs are captured within software licenses, hardware, upgrades, customization of modules to local HRM systems and activities, employee training and development (also an organizational factor), recurring staffing budgetary funding/allocations to maintain and manage the HRIS as well as the recruitment and retention of external consultants for their expertise, and professional competencies and skills. The latter is typically an area where public organizations underestimate, and it creates costly problems such as staffing and maintenance of the HRIS projects and streamlining human resources to work with HRIS adoption and implementation as well as focusing on their existing portfolios (Roach and Davis-Cooper 2016).

Organizational themes identified internal factors attributed to public organizations such as their culture, institutional frameworks (informal and formal), and other justifications that contributed to public administrators' and managers' decisions to adopt and implement HRIS. These characteristics may vary yet be similar within public organizations. The presence of quality leaders and innovation champions are organizational factors that impact successful adoption and implementation. These are the persons who are likely to support the framing and adoption of policies for HRIS. They also play inspirational roles in motivating line managers and employees during the implementation process. When leadership is challenged by their absence, inactivity, and/or limited support, this can hamper the effective transition into such a huge technological innovation. Consider the negative impact of insufficient implementation by leaders in their preparation. Leaders within public organizations are responsible for the timing of the HRIS initiatives among other duties. These include planning the facilities, design of the technical infrastructure, change

management strategies, securing adequate budgetary allocation, funding, and other resources. Leadership is also charged with project team staffing of their human resource maintenance and decision-making. All of these illustrate the major areas where leaders need to manage and how these may create challenges for adoption and implementation risks for HRIS from start to finish when leaders are not adequately prepared.

Unrealistic time frames for the adoption and implementation of HRIS also contribute to organizational problems public organizations face. Speedy adoption and implementation of HRIS are unrealistic for bureaucracies given their size, diffusion of power, fragmentation, red tape, political forces, and lines of hierarchical authorities that need to communicate, coordinate, and integrate. When inadequate time is devoted to such initiatives public administrators and leaders may overlook or underestimate best practices, short-circuit time taken to reflect on customization and system design/redesign, workflows, and other platforms for HRIS (Roach and Davis-Cooper 2016).

Thus, other organizational challenges that are impacted by HRIS adoption and implementation are linked to other HR functions and activities such as recruitment and selection of relevant human resources and their retention (discussed above), training and development, and planning. Hiring and selecting human resources with the requisite KSAA factors are critical to HRIS once they are adopted and more so implemented. Some public organizations recruit IT staff on contract or may have such employees working on HRIS as a project in addition to their existing functions. In some instances this can put a drain on human resources, and there could also be cases where inadequate staff exists to manage the project implementation. Training and development of staff are related activities that can be negatively affected when employees firstly are not able and/or willing to be trained, do not possess the capacity for technical skills and competencies, and if organizations do not plan ahead for their staffing and development. Public administrators are required to plan to reserve a significant complement of employees to work on HRIS full time. Due to many constraints for public organizations in their budgetary allocations and funding, this aspect may be underfunded or inadequately staffed with persons who may be square pegs in round holes. In other words, these persons may not possess the requisite KSAAs or are less qualified. As mentioned already, there are situations too in which staff is stretched beyond their normal capacities in doing parallel work in their typical roles and on the HRIS project.

Change management strategies are a corollary from employees' lack of readiness in their training and development for HRIS adoption and implementation. Typically, from a strategic planning perspective, many public organizations do not prepare their employees and the entire workplace for such a large-scale change. This may have serious negative repercussions on organizational culture, especially if it is averse to technological innovations. Change management interventions are required to facilitate process change, communication through the transition from old systems to new ones, and organizational restructuring and design and even creating new work system designs that may be required. When there is insufficient preparation for change and managing the process strategically through planned approaches, employees as end users may be skeptical, fearful, frustrated, and stressed, and this may affect the effective transition and implementation of the HRIS within organizations' HRM systems. Organizational behavior issues may come to the fore such as motivation, employees' perceptions of the changes, and individual decision-making processes, which require skilled leadership to manage while achieving new organizational goals and objectives (Razali and Vrontis 2010).

Poor implementation of strategic planning can also occur during adoption and implementation. In light of funding and cost factors, some organizations increase their risk factors when they under plan for the actual rollout of the HRIS implementation phases. For instance, it may be unrealistic to estimate for a 6-month project plan to have all HR modules working with their functionalities when in all reality, this may be impossible for large bureaucracies with complex structures, layers, and systems. On one end, funding may be reduced

during the duration of the implementation phases, but, conversely, it is compromised for quality implementation and effective planning which will impact the overall system's functionalities in the long term.

Environmental factors recognized the role played by external forces that influenced the adoption and implementation of HRIS. These include but are not limited to government laws and regulations, economic conditions, the role of labor unions, competitiveness, sector differences, and global trends such as administrative reform initiatives and benchmarks for best practices in adoption and implementation of HRIS.

From strategic planning we are informed that with any strategic implementation, there will be a combination of consequences which include strengths, weaknesses, opportunities, and threats (SWOT). Using this orientation in planning, environmental influences identified external conditions that brought both opportunities and threats to adoption and implementation. Hence, scanning the environment may challenge organizations to identify some of the weaknesses or threats that may require contingency approaches to manage while HRIS are being adopted and implemented.

From the foregoing, the literature highlighted that these three factors (technological, organizational, and environmental) are critical areas and complex to HRIS adoption and implementation. They may be viewed as independent and dependent variables with dual impacts on HRIS within public HRM systems. Benefits are clearly derived with this innovation. Yet, challenges abound that equally affect the successful adoption and implementation of HRIS in dynamic and unpredictable ways captured by the existence and confluence of these organizational, technological, and environmental factors.

## Recommendations

It is clear that HRIS are among some of the contemporary technological innovations that have helped to push forward the field and practice of HRM within public organizations. The old personnel was narrowly framed with manual intensive and record-keeping functions that were quite slow and obsolete given the growing demands and needs of an HRM system today. The adoption and implementation of HRIS have ushered in opportunities that have literally transformed, restructured, and reengineered the activities, practices, processes, procedures, and released resources (both physical and human) to strategically redesign and realign work systems. They also accommodated greater functionalities and produce competitive results and end outcomes for public organizations. This transition is not a quick fix, as discussed previously in examining the challenges that public organizations experience in adopting HRIS as well as some of the major implementation risks. This section of the chapter will offer recommendations that may be considered as a way forward into the future.

Governments need to streamline policies and their strategic responses to external environmental influences. Government laws and regulations are legal policy tools that can provide the force and power to regulate and manage the functionalities within HRIS. Large bureaucracies due to their complexities and size may be too slow to enact the legislative reforms required to initiate the institutional frameworks that require restructuring to accommodate the effective use and application of HRIS functionalities. These changes must be done strategically by governments in coordination with diverse stakeholders within their agencies in order to make the most effective applications of HRIS.

A corollary to the above recommendation is to benchmark studies done by other countries and agencies in light of global administrative reforms initiatives, government laws and regulations, the presence of labor unions, competitiveness, and economic conditions to tailor best practices as models for HRIS innovation, adoption, and implementation. Partnerships can be forged in dynamic ways and at various stages (external and internal to public organizations) of adoption and implementation. By so doing, this may help to minimize many of the pitfalls experienced in adoption and lower implementation risks and related challenges identified in the literature.

Additionally, partnerships can be created with stakeholders from labor and management and administrators and champion leaders from public 77organizations. Through these partnerships, in-house focus groups, teams, and/or consultations can be set up to provide input and feedback on HRIS as they apply to adoption and implementation. This partnership can be used as an innovative co-optation of a stakeholder who in personnel administration may be perceived as opposing. Consultations can foster improvement in their interactions with administrators and champion leaders at executive levels. This level of communication may extend to all aspects of public organizations' HR activities, services, processes, functionalities, and general operations.

Similarly, co-opted groups/teams comprising labor and management may be charged to review and provide statistical analyses of HR activities such as recruitment, selection, terminations, promotions, transfers, retirements, seniority listings, performance evaluations, and other related data that can be compared, synthesized, and used to inform strategic decisions with labor and management in consultation as strategic alliances. In the past this has been an area of dispute yet setting up such partnerships through consultations and/or teams can bridge gaps and strengthen the outcomes for public organizations in their pension negotiations, trend analyses of employees' sick leaves absences, attrition, overtime, compensation, and benefits.

More effective HRIS innovations can be better managed through change management strategies which need to be coordinated systematically and be carefully timed. Technology changes of this magnitude may require employees to make psychological and other adjustments. They also impact cultural norms, practices, and employees' readiness levels. Employees' technical skills and competences may also have to be considered. All of these factors need to be assessed to ensure that as HRIS are adopted and implemented, driving forces in the change process outweigh constraining forces, thus enabling more effective HRIS initiatives for public organizations.

In the same vein, process consultations as intervention approaches should be applied among change management strategies. These include but are not limited to cross-functional teams or task forces which can be set up to provide wide-ranging reports, analyses, monitoring, and tracking mechanisms that can increase accuracy, timeliness, and effectiveness in reporting and evaluating HRIS functionalities as they are phased into the organizations. Take the example of functions and activities such as HR planning and how it may affect performance management activities such as succession planning.

Additionally, align HRIS to support public organizations' strategic priorities and, in so doing, impact their end outcomes. This can only be done in a setting where strategic HRM practices and principles are actively applied. This approach strongly mandates that planning must be aligned to organizations' strategic plans; strategic plans must be linked to HRM strategic approaches and applied broadly to all HR functions and activities. Hence, close links should be reflected, monitored, and maintained to ensure that planning is coordinated comprehensively, and this will increase the improvements in all functionalities of HRIS and minimize implementation risks, thereby evaluating organizations' overall ongoing performance (Roach and Davis-Cooper 2016).

Externally, when HR planning is executed effectively, it can facilitate powerful tracking and evaluations of public organizations' HRM operations, government rules and regulations, and HRM officials' responses. This feedback may be fed back into the HR system to determine discrepancies and efforts that can be aimed to address the same in proactive ways using strategic adoption and implementation measures. New legislation can be supported using global developments, performance in HRIS innovation, and approaches using strategic HRM principles and practices. HRIS would be streamlined to provide government officials and administrators with accurate estimates of costs based on market demands (current and future), other forecasts, and using statistical analyses to inform the same officials with adequate data for realistic budgetary allocations and time frames, along with other feasible resources and processes for HRIS. Therefore,

integrating HRIS planning with HR functions and activities linked to organizations' financial plans and budgetary allocations will, ultimately, improve public organizations' overall performance. These may impact areas such as better adoption and implementation of HRIS, development of realistic projections, strategic links with all HR and functionalities, data accuracy, alignment and control of budgeting and planning processes, compensation management programs, and contingency plans based on current and future forecasts.

Internally, administrators and champion leaders need to be actively engaged as stakeholders in the process of adoption and during the implementation phases for HRIS. These roles must be sustained from start to finish in order to realize the full benefits of HRIS to public organizations' HRM systems. The roles played by these leaders and administrators can impact technological and organizational factors. In terms of system design and compatibility, leaders can ensure that HRIS designs are not too complex, user friendly, compatible to organizational processes and systems, and feasible with the institutional frameworks that exist. By so doing, it will enhance the HRIS that are chosen and implemented to fit the local needs of organizations and their employees.

Their roles as change leaders within their organizations must also be aligned to how they execute their planning functions as they relate to training and development of their employees for HRIS initiatives. Training and development need to be linked to their organizational strategic plans, HRM policies, and other HR functions. This will facilitate the knowledge transfers and application of knowledge management strategies and systems to build capacity and talent from their human resources. Corollaries to this are the effective recruitment and selection of employees, who possess the KSAAs, self-efficacy, and intrinsic motivations to learn and perform new roles effectively for HRIS. Programs to facilitate training and development also need to accommodate employees' learning styles, their orientations to learning their jobs and responsibilities using this innovation.

## Conclusion

Finally, HRIS offer many benefits and transformations for contemporary HRM strategies and public organizations. As a technological innovation, there are risks and challenges to adoption and implementation. Strategies must be used and adapted skillfully to address these challenges as administrators and their organizations attempt to meet the demands of this twenty-first-century workforce environment. Recommendations are put forward and should be taken into consideration as the public sector streamlines their operations, processes, and systems to accommodate for new innovations and new system designs for HRIS within their HRM macrosystems.

# Human Resource Management Challenges in a Developing Economy

Sunia Vosikata
Graduate School of Business, The University of the South Pacific, Suva, Fiji

## Synonyms

HRM practice; Human resources management; Public service reform; Social capital; Western HRM practice

## Definition

| | |
|---|---|
| Networking | The action or process of interacting with others to exchange information and develop professional or social contacts. |
| Public Sector | Government and all publicly controlled or funded entities that deliver programs, goods, and services. |
| Public Service | A service intended to serve all members of a community. It is usually provided by the government to people within its jurisdiction, either directly (through the public sector) or by financing provision of services. |
| Itaukei | Native or indigenous Fijian. |
| Indo-Fijian | Are Fijian citizens of fully or partially south Asian descent, including descendants who trace their heritage from various regions of the Indian subcontinent. |

## Introduction

The key HRM challenges facing developing economies today vary in accordance with its respective doctrines for survival and good governance, taking into account its political and economic environment. In acknowledging the known HRM challenges, the foregoing will focus on unknowns and emerging challenges in the Fiji Public Service (FPS). Vallance (1996) highlighted several known challenges and these included brain drain; poor education quality within the HR pool; and lack of manpower planning. While these known challenges have intensified through the post-independence and post-republic era in Fiji, other unknown HRM challenges are presented in text and include: difficulty of transferring and utilization of Western HRM practices; pressures for reform on the public service from donor agencies and their stakeholders; and the need to change the mindset of public servants (Hewitt et al. 2002). These unknowns provide substantive contributions to develop the HRM literature for the FPS in view of the challenges they impose on HRM. These critical insights have been formulated as the basis in understanding the contemporary outlay that has shaped HRM within the FPS.

## The Model and Rationality

Building and understanding a well-grounded HRM theoretical framework are crucial to guide the management of HRM through its varying functions. It is absolutely essential that FPS managers are not only guided by a relevant theoretical framework to incorporate and instill elements of rationality to improve the accuracy of decision-making and strategy formulation, but also must understand the preconditions, merits, and logic

behind the predictions of the model and its framework (Vosikata and Faifua 2012). Against the Pacific Islands (PI) social capital backdrop that provides the contextual basis, the critical alignment of the various HRM challenges as against the practice of the same in view of HRM policy development and application is presented. The accumulated social capital in Fiji from the different ethnic groups provided the basis for the inception of social subsystems that formed networking ties.

The impact of globalization has influenced HRM in developing nations like Fiji, and public service managers are mandated by the state and other key stakeholders to modify the methodology of operations and service delivery. In his study, Holden (2002) stated that this issue, together with the serious economic downturn of the 1990s particularly among developing economies, caused many to abandon regulatory state measures for more liberal economic policies. In the process, the subsequent environmental influences hinder HRM theoretical development in developing nations and the consequences are severely felt. The vulnerability of these countries' policy infrastructure is unable to withstand the robustness of the market. HRM in the FPS can be classified as a "cross-cultural HRM," where multicultural phenomena have been spinning diverse networking intricacies through the social, political, and economic environment and indirectly reinforcing their stronghold and status on HRM policies and its application.

It is important to conceptualize the ways in which HRM ideologies confront the social context in a developing nation, particularly how they are embraced and adopted. Poole (1982) established the effective harnessing of HRM as the discipline base for his theory, which provides the theoretical framework for his study. He linked the theoretical constructs to the research design by highlighting key HR variables, grouping them and operationalizing them to form two key research questions. Firstly, what are some of the general forces that affect the personnel function in organizations, and secondly, what are some ways in which HRM may be different in "emergent" countries from other developed nations? In that context, presenting HRM challenges in developing economies (Pacific Island Countries – PICs) is substantial since these microstates have a unique social context.

Three major challenges depicted in Fig. 1 represent the core theories in view of how HRM ideologies have been challenged in developing economies, including Fiji.

## Mimicking of Western HRM Practices

The Western HRM model was not brought into developing economies public sector institutions (e.g., the FPS), as a result of comprehensive needs assessment backed by a theoretical framework to guide the application of these theories. Rather, the rationale for their implementation could be aligned with Mellahi and Frynas (2003)'s findings which informed that in view of their fragility, developing countries had no alternative but to accept consultative governance infrastructure and policy assistance through aid from donor agencies, particularly from developed economies. In this context, reform packages for developing and underdeveloped nations were always conducted on a reactive rather than a proactive basis, and the major pre-conditions were the change in government and the interests of government key stakeholders in the private sectors and corporatized institutions. Consequently, the forces behind these changes emanated through the obligation of democratically elected governments to their electorates through their political manifestos, which indirectly accumulated unnecessary mileage that pressurized the bureaucracy and state institutions.

Fiji became a fully sovereign and independent nation within the Commonwealth on 10 October 1970. Fiji was a parliamentary democracy for 17 years after independence, and during that period Ratu Sir Kamisese Mara and the Alliance Party dominated political life. However, ethnic tensions between the two major races resulted in a series of military coups (1987, 2000, and 2006) deducing a social situation whereby public service institutions have remained troubled and fractured. Because of that, the developmental status of the HRM framework within the FPS was continually

**Human Resource Management Challenges in a Developing Economy, Fig. 1** HRM challenges facing Fiji Public Service

bombarded with unnecessary intrusion by key stakeholders of government. The unnecessary intrusion destabilized any rationality in formulating the HRM framework; hence mimicking Western and readymade HRM practices was the only way out. In conducting a study on the FPS reforms, Sarker and Pathak (2003) found that the FPS was not ready because social, political, and economic objectives were often conflicting. Thus, the aggressive determination of the social and political networking institutions to attain and assume control of the management of the state and its affairs always took a lead over sound economic management.

As a result of the political developments of 1987 and the birth of the Republic of Fiji, the immense pressure to continue and uphold efficiency and effectiveness to operate the FPS was eminent. Considering the situation, managers in the FPS desperately searched for new ready-to-implement HRM concepts. This was not done because their previous practices and policies had become obsolete and inadequate in the new corporate and public sector environment, but was out of necessity in order to manage and operate the public service in the new republic, considering its social and political contexts.

## Cultural Constraints

The national culture of a nation often provides the national temperament, which influences HRM policies. In some very collectivist and family-oriented societies, selecting someone you know is often a norm and considered ethical. In their study of the Iranian public and private sectors, Cassar and Bezzina confirmed that "a distinctive challenge facing the Iranian public sector human resources (HR) selection programme is nepotism or hiring someone who is known to someone else in the organization" (2005: p. 165). They found that this is due to the Iranian national culture of being family oriented and distrusting outsiders. The assumption is that a known person will be more committed and loyal to the organization than a complete stranger.

Mimicking Western HRM practices in the Fiji social context was not easy, as cultural constraints

often infiltrate the management of the public services. However, given the socioeconomic and legal environment for the period (1987–2006), it was the ideal policy initiative. This was because of the inherent difficulty in formulating a conducive HRM framework suited to a developing nation's public sector institution operating under such environment. An additional constraint for the FPS would be the difficulty in transferring HRM practices into a work culture consisting of public servants made up predominantly of Itaukei who were used to their communal family-oriented framework and Indo-Fijians with their individualistic cultural set up (Nayacakalou 1975). The political and social environment of Fiji, particularly after the developments in 1987, reinforced segregation of the mainstream races, building a nationalistic culture, which infiltrated HRM policies of the FPS.

## Pressure for Public Service Reform and Survival

The impact of mimicking Western HRM practices as a challenge on HRM within the FPS is complimented with the immense pressure for reform and survival for the Republic of Fiji and its public service. In that regard, mimicking Western HR practices as a policy choice has been a challenge for developing economies. However, it is crucial in managing public service institutions and in stabilizing the operations in view of political, social, and economic uncertainties. In their research on the Algerian civil service, Mellahi and Frynas found that "mimicking western HRM practices in an alien social context are often ineffective and the objective for such integration into public services are often vigorously scrutinised by stakeholders" (2003: p. 77). This is because of the inherent difficulty in transferring HRM ideologies between different cultures and the inability of Algerian managers to understand the potential problems that might be created by applying western HRM practices in Algeria (Mellahi and Frynas 2003). In that regard, expectations for the performance of public sector institutions from key stakeholders may override any rationality in the application of HRM policies. Hence, performance expectations may exert pressure for public service reform and survival.

## Obsolete HRM Policies

For Fiji, pressures for reform also emanate from stakeholder claims that the public enterprises were operating at unacceptably low levels of efficiency and effectiveness. These stakeholders include internal private sector institutions and external financiers, including certain leading developed economies and their financiers. Some of the reasons identified for this included a lack of accountability, overstaffing, corruption, and cronyism (Department of Public Enterprises 1998). Mellahi and Frynas also confirmed that "managers in the civil service have desperately searched for new ready-to-implement management concepts as their previous practices have become obsolete and inadequate in the new business environment" (2003: p. 75). They found that these managers hoped that such adoption would enhance their effectiveness and give them a fighting chance in the fiercely competitive global markets.

External donor agencies, particularly the International Monetary Fund (IMF), World Bank, and the Asian Development Bank (ADB), have also been exerting pressure for reforms and have played a key role in public service reforms in Fiji. This pressure-cooker situation capitulates FPS managers to implement reforms dictated by change agents, and policy structures of these reforms included the application of Western HRM practices, which is not conducive to the developmental potential of HRM policy instruments in developing nations including Fiji. One has to wonder whether they were actually being coerced by the "change agents" to adopt public service reforms through HRM infrastructural and policy changes. On that note, PI countries' public service reform patterns all had the same unique framework whereby the donor agencies dictated and indirectly controlled the reform processes (Vallance 1996). In Fiji, for example, at the time of the FPS's establishment, Western democracies including Australia and New Zealand were leading the "charge" for efficiency, expediency, and managerial autonomy through decentralization of

the public services (*Fiji Government Gazette* no. 1, 1874). Fiji and other PIC countries have neither the resources nor the flexibility to transform their public services quickly or to keep pace with global trends in public service management. The outcome has made PIC countries over-reliant on the developed economies within Oceania, hence reinforcing their status as micro-states.

Political and economic instability in Fiji also exacerbated the situation, hindering the rationality of public service reform initiatives. On that note, FPS managers and policy makers had a key role in influencing HRM legislation, particularly HR selection and decisions. Fiji neither had the resources nor the flexibility to transform its public services quickly or to keep pace with global trends in public management. The scenario was exacerbated in the period 1987–2006 with unnecessary intervention in its democratic processes and systems of governance. The outcome made Fiji over-reliant on the developed economies within Oceania and the developed world who continued to assert their status as the life-saver of Pacific Islands (PI) microstates. This over-reliance created a norm over time for these PIC including Fiji, whereby reputable institutions like the United Nations, World Bank, and others classify them as developing or under-developed nations. As evident in many SPI countries, including Fiji, the above-mentioned donor agencies have been permanently set up within developing economies to manage the aid bandwagon in its many forms, from infrastructural to HR development. Further, the public service reforms were often initiated through a tripartite arrangement where political mileage was often prioritized against the rationality of incorporating the desired economic objective (Sarker and Pathak 2003).

## Changing Mindsets of Public Servants

Public service reforms were often initiated in developing economies through a tripartite arrangement where social, political, and economic mileage were prioritized as against incorporating desired HRM practices to improve performance. Cassar and Bezzina highlighted that "the structural and operational changes in the Maltese public service were spearheaded through the European Union (EU), due to Malta's accession to the EU" (2005: p. 213). Further, they also stated that it is important to note that under the supervision of the EU, the Maltese Public Service Reform Commission Report (MPSCR) mandate was primarily to execute structural and policy changes. The attempt to change old mindsets (Hewitt et al. 2002) was relatively ignored, except for retraining recommendations. This is "considering a work force environment which is characterised by: relatively small-scale market conditions, community oriented business giving rise to a clan mode of organising work" as found by Ouchi (1980), and "dominant cultural norm of consensus and tradition ingrained in traditional values and beliefs" (Baldacchino 1999). This societal set-up is similar to many developing nations in the Pacific, including Fiji. Further, Cassar and Bezzina found that Malta although in a transitional state, "still operates an institutionalised employment relationship based on collective agreements in which many conditions of employment are regulated by powerful societal systems and preset by national legislations and networking" (2005: p. 207). The critical lesson for public service organizations in developing nations from the Maltese civil service study is that "people must change before institutions can."

The domination of culture over HRM ideology and the tensions between the competing social capital groups within the FPS have resulted in public servants clinging to their own social group mindset. In this regard, public servant's mindset needs to be changed to fully embrace newer ideologies, good governance, and HRM concepts that improve and sustain worker performance. The major issue contributing to the current mindset of Fiji public servants stems from the social environment through culturally developed social capital.

In view of the above mentioned, two critical assumptions need to be presented. Firstly, the belief and traditional obligations of Itaukei that social capital is inherited and must be owned for life (Ravuvu 1987), and the ontology regarding economic prowess from Indo-Fijians that social capital is acquired through savings and hard work, hence their identity must be formally recognized by the state legalizing ownership and status.

When entering the FPS, public servants from these two dominant ethnic groups transfer these beliefs into the FPS through their ethnic groups' social capital ideologies and networking; hence, mindsets are preconditioned by the culturally ingrained phenomena.

## Conclusion

The stated constructs have provided the leeway in challenging HRM in a developing nation context where organizations and government institutions are attempting to implement Western HRM practices. The theoretical framework has the potential to expand knowledge on the challenges to contemporary ideologies in HRM poised by the vulnerability of developing economies and microstates. Since gaining independence from Britain in 1970, Fiji has experienced a period of military coups d'état that have radically changed the government and the bureaucracy. The ramification of this event on HRM within the FPS has been severe and has influenced the HR competency databank of the FPS. Vallance found that through emigration and brain drain, "chronic shortages of skilled staff characterise the public service sectors of many Pacific Island countries including Western Samoa, Vanuatu, Solomon Islands, Tonga and Kiribati" (1996: p. 93). Compared to other PI countries, the population of Fiji has recorded a much more diverse ethnicity. However, the coup d'état era alone cannot be blamed for the HRM constraints and associated challenges, as the root cause of instability lies deeply embedded within the societal environment of Fiji. The vulnerability of many PI countries has also affected their ability to operate their bureaucracies and handsomely compensate public servants to operate the needed competency level for each public service function. This has posed a critical challenge for HRM in the FPS, hence it is forced to rely heavily on others.

# Human Resource Management During Wartime

Osama Hazzi
FrontiersToday, Vienna, Austria

## Synonyms

Human resource management; Personnel management; Wartime

## Definition

Human resource management (henceforth, HRM), as the reference work entry in hand

could define, is a philosophy that organizations design to prioritize some practices over others in which organizations could retain their human capital, i.e., employees, appreciate their performances, and orient the organizational compass toward what the reality demands.

## Introduction

Yet, the literature has not answered the question of how HRM could work during wartime. The current entry is an attempt to fulfill this shortcoming and shed light on the Syrian experience. Hopefully, the entry could contribute to revealing an HRM philosophy (the significant part) to share with other working cultures.

**Human Resource Management During Wartime, Fig. 1** Retention, recognition, orientation. (Note: the author prepared this figure)

## Story

The experience shows that matching between the HRM-related theory and practice does not always work, especially under uncertainty. This holds true for the private insurance companies in Syria where the war drove two companies (one of which is Islamic) to prioritize practices to cope with the prevailing working conditions. Also, another company has shown a practice worth thinking to consider during tough times. The current entry was in close contact with the people in charge of the HRM at the headquarters in Damascus during the wartime to conduct a research. This opened the door to get further data and extrapolate three HRM practices and give them meaning. Figure 1 shows a translation of those practices into an HRM philosophy that one might call RRO (acronym for Retention, Recognition, Orientation).

## Discussion

Wars drive organizations to lose branches (to be out of service) and result job insecurity. A private Islamic insurance company had to reappoint employees that have come from hot spots in safe places. The logic of this employee retention could be a kind of humanism and is effective at the economic and social levels where it could contribute to decreasing unemployment and showing solidarity. Employees, in their turn, could feel job security and reciprocate their organization. At the organizational level, employee retention could save time and money organizations spend to hire and train fresh staff. It would be wise to perceive good working conditions organizations should consider anyway. This argument could justify why employee retention could be a key HRM practice.

An observation showed that a different private insurance company has practiced employee recognition such as to publicly shout-out employees on the employee of the month list. This HRM practice could be effective during wartime to send a message to both subordinates that their company appreciates their top-notch performances and stakeholders that the workflow is still on. A worth-thinking concern is about the antecedents that drive those subordinates to distinguishably work during wartime.

Wars rise of necessity of orientation. The data revealed that another private insurance company laid off employees and that some of the latter left work at their will; consequently, the company had to merge the personnel management into the HRM department (although the literature (see

Armstrong and Taylor 2020) shows that the first synonym and the latter term may seem unrelated, both are somehow two sides of the same coin). Orientation could be a practice that shows the extent to which HRM could flexibly orient organizations toward a new reality.

## Conclusion

A right HRM philosophy in one culture may not work in other cultures. There is no one best HRM philosophy for all working cultures, but there are different philosophies organizations could use to cope with their own working cultures. Today's changing organizational working conditions demand the academia and industry to consider this diverse. Organizations should consider going beyond contractual role prescriptions (specified role requirements) and practice functional extra-role discretionary behaviors such as organizational Ihsan behavior, OIB (see Hazzi 2018, 2020; Hazzi and Hamod 2019); organizational citizenship behavior, OCB (see Smith et al. 1983); and prosocial organizational behavior, POB (see Brief and Motowidlo 1986) at times of uncertainty to cope with unpredictable roles the new reality demands.

# Human Resource Management in Russia

Tatiana V. Zaytseva
Lomonosov Moscow State University, School of Public Administration, Moscow, Russia

H

## Synonyms

Cadre Management; Leadership; People management; Personnel management; Workforce management

## Definition

Human resource management is an approach that considers employees as the main source of value and sustained competitive advantage of organizations and includes seven broad activities that together constitute the HRM system: job design, staffing and retention, development and training, managing change and performance, remuneration, and organizational behavior.

## Introduction

Modern human resource management in Russia (hereafter, HRM) traces its roots to a variety of historical, cultural, economical, and even ideological influences. When it comes to considering the essential nature of HRM in Russia, one should address not only the development of science and scientific research but also some crucial events in

the Russian history of the twentieth to the twenty-first centuries.

In science and academic discipline, "human resource management" gradually finds its recognition in Russia. In the USSR, HRM was not considered as an independent science. However, main subject areas of HRM were developed in the framework of economics as well as in pedagogy, sociology, and psychology. Research on production teams, labor relations, effective leadership, motivation, group management, etc. was conducted by different scientists and scientific institutes.

The first studies, which formed the basis of modern theory and practice of HRM in Russia, belong to the famous Russian physiologists I. P. Pavlov, I.M. Sechenov, and V.M. Bekhterev. Their research in the field of human physiology, most of which came at the end of the nineteenth century, stimulated interest from practitioners and theorists to the distinctiveness of the labor process from the point of view of physiological capabilities and limitations, as well as specific characteristics of individuals. As a result in 1895, Russian scientist I. Rihter published the book *Railway Psychology* [Zheleznodorozhnaya psihologiya] where the author on the basis of his research on the reaction rate and other important indicators raised the issue of professional suitability of operators of locomotives. At the same time in the Military Medical Academy in St. Petersburg, a group of scientists carried out experiments for the study of professional activity of pilots with the aim of designing and measuring their work.

In 1903 (1 month prior to the first publication of F. Taylor), Karol Adametski – a Russian industrial engineer – made his report on the Assembly of the Russian Mine Industry where he summed up his observations on possibilities of improvement of the labor process through the use of scientific methods in contrast to intuition. Further in his article "Harmonization as one of the main foundations of the Scientific Management" [Garmonizaciya kak odna iz glavnyh osnov nauchnoj organizacii], he advanced more in his studies of the principles of labor management basing his arguments on comparison with mechanisms that are universal. In particular, in addition to the famous four principles of F. Taylor, he formulated the principle of cooperation, which later became known as the effect of the economy of scale.

Later these and other similar studies formed the basis of scientific labor management – applied science that received tremendous development during the Soviet time. Scientific labor management is close to advanced industrial engineering that was actively developed in Western countries during the same period of time. The main difference is in the emphasis on the labor process on the basis of labor and industrial psychology on the one hand and the development of labor rate settings on the other.

## Scientific Labor Management

Scientific labor management (SLM) in the Soviet Union received official status not only as an area of scientific research but also as a mandatory management activity. All soviet factories and most of Russian enterprises now have specialists on scientific labor management among their staff. The best known scientists that developed theory and practice of SLM were Osip Ermansky, who introduced the concept of scientific labor management, and Aleksei Gastev, the founder and first director of Central Institute of Labor. Osip Ermansky devoted himself to the studies in the field of general management, organizational theory, and innovations. His book *Scientific Management of Labor and Production in Taylor's System* [Nauchnaya organizaciya truda i proizvodstva v sisteme Tejlora] published in 1925 was translated into five European languages and had four editions. *Theory and practice of innovations* (1929) [Teoriya i praktika racionalizacii], another of his books, was one of the first books in the world on rationalization and innovation processes and had five editions before he was arrested in 1933 as "enemy of the State" during Stalin's repressions in the USSR.

The main works of Aleksei Gastev "How to work?" [Kak nado rabotat'?], "Labor attitudes" [Trudovye ustanovki], and "Regulation and organization of labor" [Normirovanie i organizaciya

truda] were oriented on achieving key managerial goals of enhancing the labor process, pushing work forward, adapting to changes in the fluctuant environment, and overcoming technical barriers. Due to research developed at the Central Labor Institute, soviet scientists created a detailed system of standardization and measurement of almost all types of work starting from manual work in factories and finishing with administrative work of executives and creative work of poets and musicians. They also introduced a very important managerial concept of "minimum correspondence to a position" or "minimum allowed performance" defining requirements for an employee's professional activity at his workplace that will guarantee achievement of a break-even point. This concept still remains unique to managerial science as Western researchers were always concentrated on managing the achievement of advanced goals ignoring the fact that if an organization does not control the lower band of performance, an employee can not only fail in achieving objectives but also drop in his performance below the bottom line.

This concept was further developed by Tatyana Zaytseva, who introduced the idea of a "performance corridor": the range of employee's efficiency and performance between the minimum allowed and maximum possible dimensions (Fig. 1).

Both dimensions are managed as independent tasks and reflect themselves in the salary formula:

$$S = F + C$$

where:

S – Salary

F – The fixed part of a salary that is linked with the break-even point of a specified task

C – The changeable part of a salary that is linked with employee's performance above the minimum allowed rate for this task

## HRM and System Approach

Another direction of expansion of the Soviet and then Russian management science relates to the development of main managerial activities like planning, coordinating, motivating, and controlling in a framework of system approach. In 1903 the Russian scientist Alexander Bogdanov published his first article, and in 1921 his book *Tectology. Common Organizational Science* [Tektologiya. Vseobshchaya organizacionnaya nauka] describes the main principles of systematic approach in management of organizations. From his point of view, Tectology has a universal character, explores all realms of nature and of society, and therefore has the highest degree of abstraction when considering the system of relations between various system elements without regard to the specifics of these elements. He concentrated his studies on finding factors breaking the system's balance. Today his findings are actively used in the theory of sustainable development. His rule of vulnerability was further used in developing a wide range of methods, for example, by American scientists while developing PERT method (Program (Project) Evaluation and Review Technique).

In the Soviet Union, ideas of Alexander Bogdanov were hereafter promoted by supporters of the system approach to an organization (S.P. Nikanorov, V.S. Rapoport, V.I. Burkov, and others) and program-targeted management (G.S. Pospelov, G.A. Irikov, and others).

**Human Resource Management in Russia, Fig. 1** Performance corridor. (*Source*: Tatiana V. Zaytseva. Sistema upravleniya chelovecheskimi resursami. Izdatel'stvo Moskovskogo universiteta. 2012, str. 142)

A special place in the development of Soviet managerial science is devoted to the founders of the Moscow Methodological Club – an association of researchers in the field of management, which was based on the principles of theory of activity – E.G. Yudin, G.P. Shchedrovitskii, and others. The book of G.P. Shchedrovitskii *Organization, Leadership, Management*| (1970) [Organizaciya, rukovodstvo, upravlenie] determined the main methodology of leadership and management as a "collective thinking activity." He formulated the main principles of approach that he called cogito-systematic activity theory [sistemomysledeyatel'nostnyj podhod] as the essential type of activity in organizational management. On the basis of these principles, he created a special type of training for executives that he called organizational-activity games (OAG) [organizacionno-deyatel'nostnye igry] as a method of collaborative planning and problem solving. As Shchedrovitskii wrote: "it has been noted that organizational and managerial activity has become professional, has become part of the system of industrial work, and hence also requires its own logic and methods of thought." *Planning* has become a special type of thinking activity [*mysledeyatelnost'*] (i.e., thinking within a context of practical activity) and has created around itself a special layer of *projective thinking* (combining forecasting, programming, organizational design, etc.), which also requires new means, a new logic, and new forms of organization" (Shchedrovitskii and Kotel'nikov 1988).

Theory of activity also formed the basis for research in the field of people's behavior and motivation. Soviet and then Russian psychologists introduced numerous important concepts such as the concept of intermediation and zone of proximal development (L.S. Vygotsky 1938 (1978)), the relationship between the need and the motive (A.N. Leontiev, 1971), phenomenon of personal choice (A.G. Asmolov, 1989), etc.

## Cadre Management

The third direction in the development of HRM in Soviet Union and then in Russia is related to theory and practice of staff administration (or cadre management) – a special type of managerial activity very similar to personnel management that was developed in Western countries. Staff administration was emerging in two related lines: development of workforce capacity (for national economy and for professional Army) and development of human potential (for the communist party). These directions were not rigidly separated from each other: many of the technologies were created as universal, applicable for all tasks. At the same time, there were also some differences.

*Development of workforce capacity* was concentrated on elaboration of a special methodology, tools, and techniques aimed to provide organizations with the best suited staff composition. These tools and techniques were aimed to select and hire applicants holding the most promise in terms of the *professional capacity* they bring to the organization and then to hold and to develop employees in such a way as to ensure that they make the strongest possible contributions. It included many aspects of the employment relationships such as matching (occupational guidance, hiring and adjustment), work organization (e.g., work design, teams), and professional development (education and training, career development).

The objective to optimize the performance and productivity of all workers in an organization through the use of performance management tools, compensation, and pay was not considered as being essential. It was generally thought that under the conditions of absence of private property and exploitation of man by man, every socialist worker is always working "at the end of tether." Though, it was argued that the main task of the soviet organization is to create the conditions for maximum disclosure and use of the potential of each employee. To achieve these goals, the soviet and later Russian scientists, researchers, and organizations focused their efforts on the development of three areas: (1) vocational guidance system, (2) establishment of lifelong professional learning system, and (3) managing health at work.

*Vocational guidance system* started to develop in Tzar's Russia at the end of the nineteenth

century and continued to develop through the early twenties of the twentieth century by famous soviet labor psychologists. First services on the selection of work appropriate for the specifics of the employee were created in Russia in 1897. In a very popular journal of that period, "Penitent Lexicographer" [Kayushchijsya ehnciklopedist], they published four reasons that are usually considered while choosing a job: family traditions, a random selection, a choice based on a vocation, and provident choice. In 1924 the first laboratory on vocational consulting was created in Saint Petersburg. During the first year of its existence, they observed and examined 2700 teenagers, and during the next ten years, more than 7.6 million people were observed. By 1934 the laboratory had already 86 branches that were consulting and supporting teenagers, adults, as well as disabled people. As the result of their research and practical activities, psychological job profiles were created for almost all kinds of professions along with the psychological tests intended to test specific abilities.

In parallel S. G Gellerstein and then the other famous soviet psychologist E.A. Klimov created the first world job classification system that was later adopted by Japanese scientists and practitioners and now is used all over the world for career and succession planning. E.A. Klimov also introduced the concept of *individual style of activity* – a set of methods, ways, and types of activities, which provides to a person a high level of professionalism and efficiency.

Another well-known soviet psychologist K.M. Gurevich created a theory of *professional integrity* as the combination of abilities, qualities, and characteristics of the person that creates the match to the requirements, the nature, and content of certain professional activities, which ensures a sufficiently high and reliable level of implementation of these activities. According to this concept, all professions can be divided into two groups: the first group requires absolute match between person's abilities, qualities, and characteristics and a job both in terms of psychic, physical, and professional characteristics, and the second group of professions allows partial suitability to a job.

*Lifelong professional learning system* started to be created in Russia immediately after the Great October Socialistic Revolution in 1917. One of the first Decrees of Soviet Government was the "decree on combating against illiteracy." This decree was aimed at raising the educational, cultural, and professional level of soviet people. As all the management power in Soviet Union was centralized, most of the efforts in creating lifelong professional learning system were undertaken by the government through legislation, investments, and research and then were supported by organizations. To be compared, at the end of 1916, there was only 22% of literate people in Central Russia (in Siberia 6% literate people) and, at the end of 1939, 90% all over the country.

To receive this tremendous results, the Government initiated the creation of a five-step educational system: secondary schools and schools for working youths to provide secondary education (managed by the Ministry of Education); fabric-manufacturing colleges [fabrichno-zavodskie uchilishcha] that were then transformed into vocational training schools – managed by factories to provide first level of professional education, by which young people at the age of 14 and older were receiving secondary and professional education combining it with the work on factories; technical colleges (managed by factories) to provide higher professional education; industry-specific universities and institutes (managed either by specific ministries or by the Ministry of Education); academic universities (managed by Ministry of Education); and institutions for advanced training (managed either by organizations or specific ministries). The education on each step was supported by huge scientific and research work resulting in the development of pedagogical and acmeological methods, tools, and techniques such as learning by doing, imitating modeling, coaching and mentoring, role-play and business games, professional training, project development, brainstorming, etc. As it is recognized by many researchers, this system still remains one of the most thoughtful and effective systems of professional education, training, and development.

On the other hand, government as well as organizations developed managerial tools and techniques to support lifelong learning. First of all, there was developed and implemented the *National Occupational Standards* and *Unified system of qualification grades* for all types of work and seniority. *National Occupational Standards* is a set of professional requirements formulated in terms of knowledge, skills, and experience essential for external and internal candidates to obtain a certain job and to perform effectively. These standards are still used as prerequisites in a process of candidates' selection as well as guidelines in career planning and development.

*Unified system of qualification grades* is a scale reflecting the level of competency and professionalism of employees. It was first introduced in 1928 and then had several editions and changes. Now the scale consists of 18 ranks: ranks from 1 to 8 are used for blue-collared workers; ranks from 2 to 5 are used for white-collared employees doing assistant work; ranks from 6 to 11 are used for line managers (both blue and white collared); ranks from 12 to 16 are used for unique and highly qualified specialists (like university professors); and ranks from 17 to 18 are used for executives. After finishing each step of professional development, employees participate in professional exams (attestation) and if successful receive the next qualification grade accompanied by a salary increase.

Unlike Western grading systems, this very vaguely correlates with the employee's performance but with his or her competency-based characteristics. The only compensable factor here is the level of professionalism of a person that is understood formally as a set of professional requirements that should be proven either by successful completion of proficiency test or professional achievements reflecting the level of competency (like the number of articles published in highly ranked scientific journals). Qualification grades are combined with *tariff ranks* – the cost of certain types of works depending on their complexity. Thus in this system, a salary increase can be achieved by an employee through gaining a higher qualification, without career change.

***Managing health at work*** is considered as one of the biggest achievements of Soviet and Russian HRM systems. The system is divided in four areas: working conditions, promotion of a healthy lifestyle and health education, prevention of occupational diseases, and occupational diseases treatment.

*Working conditions*: According to Soviet ideology, socialist enterprises should put an end to poor working conditions. For this purposes, the government sponsored a wide range of ergonomic and man-machine studies. One can call the names of the following academics that made the maximum contribution to the development of ergonomics in the Soviet Union and nowadays Russia: B.G. Ananiev, L.I. Anziferova, B.F. Lomov, V.M. Nebulitsin, V.M. Munipov, V.P. Zinchenko, and others. These studies resulted in the creation of sanitary-hygienic norms and rules of occupational safety (health and safety requirements) that are regularly reviewed.

*Promotion of a healthy lifestyle and health education* was carried out through lectures and talks on hygiene and the benefits of a healthy lifestyle through publishing hygiene posters, booklets, and leaflets (Figs. 2 and 3).

*Prevention of occupational diseases* was done through the establishment of doctor's offices and "preventative clinics" or "rest and recreation residences" in almost every soviet factory. Employees were supposed to participate in preventative medical screenings every year and to spend from one to four weeks in preventative clinics visiting different recreational activities and keep-fit exercises. These systems are still used in government-owned enterprises.

*Occupational diseases treatment* was organized on a basis of health resorts. Most of these resorts belonged to factories or organizations that allowed millions of people to visit these places at least once per year. Now this system remains in use in government organizations: almost each Russian ministry or government organization has their own health resort, supplying their employees with tours there at a very low price.

***Development of human potential*** was considered to facilitate the process of personality growth as determined by the Communist Party ideological framework that was called "Moral Code of the Builder of Communism." The Code could be

**Human Resource Management in Russia, Fig. 2** Soviet poster, promoting setting-up exercises on workplace

**Human Resource Management in Russia, Fig. 3** Soviet poster, promoting sport and fitness after work

called one of the first codes of professional ethics (officially adopted in 1961) containing twelve principles stated as the rules of attitude, for instance, principal № 6 "Human Relations and Mutual respect Between the Peoples: Friend, Comrade, Brother," or the principal № 7 "Honesty and Truth, Moral Purity, Simplicity and Modesty in the public and Private Life." These principles were further used to create special development programs for Communist and Komsomol party members. They were also used as guidelines in managing employees as soviet organizations had double management system: professional management and Communist party management. The choices made were recognizing the priority of meeting the needs of people, the value system was people centered, and the vision was fostering a cooperative excellence. This approach can be compared with the "soft," "high commitment," "developmental humanism" model that is used now in some modern Russian companies as a part of their strategic human resource management.

## Present State of Human Resource Management in Russia

At the present time, human resource management in Russia received rapid growth and active

development. Major universities introduced studies on human resource management, business psychology and sociology, and labor economics. A major strength of modern Russian HRM is the possibility to combine approaches and methods, developed and used during soviet time with concepts and best practices of Western academics, researchers, and practitioners. For the last 25 years, there have been interesting studies on people's behavior, on special kinds of problems that modern working life creates like problems of accountability, employment relationships, and the essentials of "good practice" in key HR tasks, especially adjustment, training and development, performance management, compensation and pay, employee's motivation, and effective communication. Among the Russian scientists that have made a significant contribution to the development of HRM science, one can name the following: T. U. Bazarov, A.Y. Kibanov, Y.G. Odegov, V.P. Pugachev, V.V. Travin, T.V. Zaytseva, and S.V. Sekschnya. As a result, human resource management has become in Russia a fashionable area of management practice and theory with developed research and scientific infrastructure.

In recent years, the way in which employees are managed and developed has come to be recognized in Russian organizations as one of the key instruments to improve organizational performance. Summarizing the features of approaches that are developed to manage human resource in Russia, we can outline the following:

1. Transition from managing people to managing human resource means that organization recognizes employees as the main source of economic and social value. That should change the whole organizational strategy placing employees as first class priority.
2. Employers began to abandon the perception of employees as a costless resource that does not require investments. To increase the quality and effectiveness of human resource, organizations should invest efforts, time, and money on a regular basis.
3. Only people have the ability to carry some of their value over a generated product, but then they need time and several conditions to compensate the outlays. Therefore, personnel costs should be considered as investments which have a payback period.
4. The longer a particular employee works in a company, the higher the returns from his or her activity. As a consequence extended duration of employment of an individual in an organization receives additional value and therefore should be supported by special retaining programs.
5. During his work, the employee creates not only short-term (e.g., performance) but also prolonged (e.g., knowledge, reputation) labor result. This means implementation besides performance indicators, metrics covering the whole life cycle of an employee in the organization.
6. Candidates have different levels of professional attractiveness to the labor market. For this reason organizations start to compete for the best people introducing wide range of benefits inside employer value proposition.
7. Competition for the best people creates agency-type relationships between an employee and an employer. While discussing terms of his employment, an employee acts as an agent and negotiates employment conditions in long-term perspective: clear guarantees of investment in his or her professional and personal development, income instead of wages, social package, etc.

Thus, human resource management in Russia is not anymore a comparatively narrow area involving mainly mechanical tasks and cutdown responsibilities such as administrative support, advising managers on the technical aspects of staff matters, and, sometimes, dismissing people. By contrast, human resource management has become a much wider activity, concentrated on the achievement of effective implementation of modern strategic tools, namely, inter-functional design and coordination, employee motivation,

job satisfaction and empowerment, progress of management style, and organizational culture.

|---|---|
| Human resource management | It refers to the use of employee management practices to attract, retain, and develop employees in an organization (Naidu and Chand 2014). |
| Contingency approach | It is part of the SHRM as it involves aligning the HRM practices to achieve the business objectives of organizations (Naidu and Chand 2014). |

## Introduction

This entry is based on a study that illuminates the main underlying problems associated with the

formulation and implementation of HRM policies in the public sector of the Solomon Islands and Samoa. To date, most of the HRM studies have been conducted within large-scale organizations in large developed countries and not much in small-scale organizations in the SIDSs. Therefore, there exist unique social, cultural, and economic variations in SIDSs that are currently not accounted for while theorizing the SHRM and International HRM (IHRM) research in the context of the SIDSs (Schuler et al. 1993). The SIDSs in the Pacific have unique geographical, economic, sociocultural, political, and technological factors that affect the HRM policies and practices adopted by the public sector organizations. For example, many SIDSs have a unique sociocultural environment, and this creates barriers to the effective management of employees. Albeit, the HRM problems may be somewhat similar; however, the impact of these problems on the performance of public sector organizations in developing countries is more significant as compared to the developed countries (Swailes and Al Fahdi 2011). Similarly, the impact of HRM problems on the performance of public sector organizations in the SIDSs is expected to be unique, and it is this gap that this paper hopes to fill.

The public sector of the SIDSs has unique features as compared to the public sector of the large developed countries. There are four ways the SIDSs are different from the large developed and less developing countries. Firstly, the development problems faced by SIDSs are different from the large developed and less developed countries (UN-OHRLLS 2013). The SIDSs have a narrow resource base. As a result of this, these economies hardly benefit from economies of scale. Secondly, small island economies have small domestic markets, heavy dependence on foreign markets, very high costs of energy and infrastructure development, and less resilience on natural disasters. Thirdly, the economic growth rates of SIDSs are extremely volatile due to global economic shocks. For instance, global economic recessions, particularly in the neighboring countries, have a substantial impact on the performance of the national economies of the SIDSs in the Pacific region (UN-OHRLLS 2013). Fourthly, there is limited growth of the private sector, and the bulk of the government resources is deployed by the public sector (UN-OHRLLS 2013). For instance, the public sector of the Solomon Islands and Samoa is one of the largest employer in their nation. The operations of the public sector consume bulk of the financial resources from the private sector that is collected via taxation.

This study is essential for two reasons. Firstly, in the recent decade, the capriciousness of the global external environment has given rise to many problems faced by the SIDSs, and the Pacific Island Countries (PICs) are not an exception to this. As the external environment is becoming unpredictable, new HRM issues have started arising in the PICs. For example, due to unfavorable socioeconomic and political factors, trained workforce from the PICs have started seeking temporary employment in overseas countries (Naidu and Chand 2014). Additionally, governments in the PICs, as part of the global reform effort, are reducing the size of the government by resizing the human resources in the public service (Barter and Russell 2013). Secondly, the HRM problems faced by the SIDSs have been largely ignored in the existing literature. Most of the existing studies have mainly investigated the HRM problems faced by the public sector of large developed and not SIDSs. Unlike large developed and less developed economies, the literature on the HRM problems faced by the public sector organizations in the SIDSs is lagging far behind. Hence, this study attempts to examine the HRM problems faced by the public sector organizations in the Solomon Islands and Samoa by using the Consistent approach to SHRM.

This entry is structured as follows. Section "Literature Review on HRM, IHRM, SHRM, and SIHRM" reviews the literature on HRM, IHRM, SHRM, and SIHRM. Section "Socioeconomic Background and HRM in the Public Sector: The Solomon Islands and Samoa" provides an overview of socioeconomic background and HRM in the public sector of the Solomon Islands and Samoa. Section "Research Methodology" outlines the research methodology. Section "Theoretical Framework: Contingency Theory, Research Findings, and Discussions"

provides the theoretical framework based on the Contingency theory, research findings, and discussions. Section "Theoretical, Organisational, and Practical Implications of This Paper" provides the theoretical, organizational, and practical implications of this paper. Finally, section "Conclusion and Limitations" provides the conclusion and limitations of this study.

## Literature Review on HRM, IHRM, SHRM, and SIHRM

The extant literature that theorizes the concept of Human Resource Management (HRM), International HRM (IHRM), Strategic HRM (SHRM), and Strategic International HRM (SIHRM) was developed after the 1980s that mainly emphasized on firms and businesses operating in the large developed countries (Dowling and Schuler 1990; Pieper 1990; Poole 1990; Dowling and Schuler 1990; Schuler et al. 1993; Dowling et al. 1999). By the mid-1990s, authors (particularly, from the USA) began to conceptualize IHRM to account for HRM practices used to manage expatriate staff working in overseas countries and the role of local culture in influencing these IHRM practices (Dowling et al. 1999). Dowling et al. (1999) went on to identify three approaches used by authors to study IHRM. The first approach was used by Adler (1997), which emphasized on the "cross-cultural management" approach used an international perspective to examine employees' behavior within organizations (Adler 1997). The second approach was developed by Brewster and Hegewisch (1994) and Poole (1999) from the "comparative industrial relations" and HRM literature that compared and analyzed HRM systems from various countries. The third approach was developed by Schuler et al. (1993) and Dowling et al. (1999) as they theorized the "integrative framework of SIHRM" and argued that both the exogenous (internal) and endogenous (external) factors influence the SIHRM.

Many studies have examined the HRM problems in large developed countries and identified three problems. These problems are (1) lack of financial resources (Van Gramberg et al. 2014; Vo and Bartram 2012), (2) difficulties in dealing with employee attitudes (Moynihan 2006; Fernandez and Rainey 2006; Shen et al. 2010; Bach and Bordogna 2011; D'Netto et al. 2014), and (3) aligning HRM practices within an institutional framework and policy (Psychogios and Wood 2010; Thirkell and Ashman 2014).

While scholars did an excellent job in theorizing HRM, IHRM, and SIHRM and problems faced in managing human resources in the context of large developed countries, there still exists a research lacuna in the theorizing of HRM, IHRM, and SIHRM in the context of SIDSs. The major limitations of the theorization of SHRM are in twofold. First, the theorizing of SHRM is based mainly on research findings in the context of large developed countries and not on the SIDSs. According to Poole (1999), this is not surprising, as the study of SHRM has been dominated by Anglo-American authors (Poole 1999). This study argues that the research findings from SIDSs are equally essential to develop a more comprehensive theory of SHRM. Lane (1989) and Poole (1999) have rightly argued that:

> The reality is the fact that there are different SHRM models between and within countries and that the 'best' universalistic HRM practices of the Anglo-American countries may not explain HRM globally. (Poole 1999)

Hence, this paper, by focusing on two SIDSs and looking through the lenses of the Contingency approach, further contributes to the theorization of SHRM.

Second, the majority of the literature is dominated by studies on SHRM in the context of private sector organizations and not on the public sector organizations (Daley 2012; Bach and Kessler 2007). Bach and Kessler (2007) has correctly mentioned:

> As human resource management (HRM) has developed as a field of study, the attention paid to public sector employment relations has been relatively limited. (emphasis by authors)

Moreover, Pieper (1990) stressed that:

> validation of an international model(s) would benefit from cross-national comparisons of a number of features identified in the internationalization process.

H

Pieper (1990) argued that theorizing of IHRM is important for two reasons. Firstly, there is an increasing internationalization of businesses, whereby Multinational Corporations (MNCs) have their head office in one country and subsidiaries in several countries around the world. In these situations, companies have to deal with diverse local cultures and national employment laws and regulations in different countries around the world. Secondly, economic and technological advancement makes it easier for businesses to expand their international operations.

This paper will focus on SHRM in the public sector of the SIDSs. The central argument of this paper is that there is a research gap in our understanding of SHRM from the perspective of SIDSs, and this paper attempts to fill this gap and add to the theorization of SHRM.

## Socioeconomic Background and HRM in the Public Sector: The Solomon Islands and Samoa

The economic growth of the Solomon Islands and Samoa has been mainly driven by tourism, remittances, foreign aid, the export of agricultural commodities, forestry, and marine aquaculture (International Monetary Fund 2014; Asian Development Bank 2015). The Solomon Islands is an ethnically heterogeneous society with a total population of 515,870 (Solomon Islands National Statistics Office 2015). The ethnic tension in the Solomon Islands during the year 2000 resulted in the destruction of local infrastructure and private sector business in Honiara, the capital city. In order to rejuvenate the economy and reconstruct the local infrastructure, the donor agencies, mainly Australia, New Zealand, and PICs, provided development assistance to the Solomon Islands. This mission was called the Regional Assistance Mission to Solomon Islands (RAMSI) (International Labour Organisation 2008).

Samoa is much smaller in land size and population as compared to the Solomon Islands. The recent census statistics of Samoa that was published in the year 2011 showed that Samoa's population stood at 187,820. Out of these, 36,735 (19.56%) comprised of the urban population, whereas 151,085 (80.44%) comprised of the rural population (Samoa Bureau of Statistics 2015). Samoa is an ethnically homogenous society, and this is one of the reasons why Samoa has been enjoying political harmony (Reilly 2004).

Since the colonial days, the Solomon Islands and Samoa have adopted the British system of public sector administration. In the last 20 years, the Solomon Islands and Samoa have adopted public sector reforms as a recommendation by the World Bank and the Asian Development Bank. The objective of these reforms was to reengineer public sector policies, practices, and processes.

### Human Resource Management in the Public Sector of the Solomon Islands

According to the Australian Government (2013), there is an acute deficiency of educated and skilled workforce in the Solomon Islands public administration. The policy framework and regulations that guide public administration in the Solomon Islands are outdated and need updating and proper implementation. The public administration system in most of the PICs is centralized, characterized by a lack of proper communication between local and national governments. As a result of this, there is no proper direction given to the allocation of financial resources and development programs and assistance. In order to counter these challenges at the local government level, many workshops and trainings have been organized on general public administration. These trainings have been largely funded by the donor agencies, such as the World Bank and the Asian Development Bank. High staff turnover and labor mobility to overseas countries are two of the main reasons why these training programs are not effective (Australian Government 2013). Some of the factors attributed to the failure of the public HRM system in the Solomon Islands are outdated policies and practices, lack of proper job descriptions, and poor implementation of the performance management system (Asante et al. 2011).

### Human Resource Management in the Public Sector of Samoa

As compared to the Solomon Islands, Samoa is far ahead in adopting new and innovative methods of public sector administration to improve public service delivery. According to the World Bank (2015), Samoa is leading the PICs on ease of doing the business survey. The World Bank's ease of doing business report emphasizes that it is much easier and faster to do business in Samoa as compared to other PICs. One of the primary drivers of this achievement is that Samoa has been able to improve its public service delivery by improving the quality of its workforce. In the recent decade, the Samoan public service has been implementing plans to institutionalize reforms, reviewing existing HRM policies, and implementing HRM systems. For example, Samoa's strategic development plan focuses on improving the quality of the health sector workforce by implementing training and development programs (Ministry of Finance Samoa 2012). Similar to the case of the Solomon Islands, the public sector of Samoa is also cramped with a low qualified and skillful workforce. In order to address this, Samoa's strategic plan for the year 2012 to 2015 focuses on human capacity building and improving the quality of education in Samoa (Ministry of Finance Samoa 2012).

## Research Methodology

The main aim of this entry is to explore the problems of HRM in the public sector of the Solomon Islands and Samoa and to examine the impact of contingency variables on the HRM practices adopted by the public sector of the Solomon Islands and Samoa. This study was conducted in the year 2013 and 2016 by using semi-structured interview schedules. The employee management officers working for the public service of the Solomon Islands and Samoa were contacted to obtain information on the problems of HRM faced by the public sector and how the contingency variables are affecting these problems. The main interview questions together with the summary of the interviews are provided in Appendix 1. These questions were based on the changes in the public sector with particular emphasis on the contingency variables that were driving these changes and the impact of these changes on human resource delivery. The employee management officers were also asked questions on the HRM problems faced by the public service. The informants were also asked to recommend some changes for improving public service delivery. The length of each interview was approximately half an hour for each government official (Tables 1 and 2).

**Human Resource Management Problems and Public Sector Management, Table 1** Solomon Islands: summary of semi-structured interviews

| Ministry number | Summary of the interviews |
|---|---|
| 1 | Change in the title of positions has provided motivation, but there are still issues related to lack of capacity building |
| 2 | Public servants are leaving employment |
| 3 | Human resource coordination problems |
| 4 | Centralization of decision-making and empowerment issues |
| 5 | Lack of qualified personnel |
| 6 | No sound human resource policies |
| 7 | Absenteeism problems |
| 8 | Unattractive pay package |
| 9 | Issues related to employee compensation |
| 10 | Centralized decision-making issues are affecting the motivation of workers |
| 11 | Public service delivery needs to be restructured to motivate public servants |
| 12 | Financial constraints |
| 13 | Budget problems |
| 14 | Ineffective policies on finance and leadership are affecting human resources |
| 15 | Coordination problems |
| 16 | Budget issues related to the recruitment of public servants |
| 17 | Changes in employee disciplinary processes are needed |
| 18 | Poor leadership is affecting the performance of human resources |
| 19 | High turnover of employees |

**Human Resource Management Problems and Public Sector Management, Table 2** Samoa Islands: summary of semi-structured interviews

| Ministry number | Summary |
|---|---|
| M1 | Lack of implementation of quality of work-life programs and labor-management participation teams |
| M2 | Performance appraisal issues leads to unfairness in promotion |
| M3 | Low level of financial incentives provided to staff |
| M4 | Lack of financial incentives available for an excellent performance |
| M5 | Inconsistent recruitment practices |
| M6 | Lack of awareness of staff about the changes in the market condition and organizational performance |
| M7 | Performance appraisal issues leads to unfairness in promotion |
| M8 | Performance appraisal issues leads to unfairness in promotion |
| M9 | Low level of cross-cultural job design |
| M10 | Inflexible job design |
| M11 | Performance appraisal issues leads to unfairness in promotion |
| M12 | Performance appraisal issues leads to unfairness in promotion |
| M13 | Lack of financial incentives on good performance |
| **State-owned enterprises** | |
| SOE | Performance appraisal issues lead to unfairness in promotion |
| SOE | Lack of financial incentives on good performance |
| SOE | Low levels of cross-cultural job design |
| SOE | Poor implementation of performance appraisal |
| SOE | Poor implementation of performance appraisal |
| SOE | Staff are only briefly communicated on the changes in the market condition and organization performance |
| SOE | Internal promotion and recruitment problems |
| SOE | Staff are only briefly communicated on the changes in the market condition and organization performance |
| SOE | Not all the staff participate in the quality of work life programs |
| SOE | Poor implementation of performance appraisal |
| SOE | Poor implementation of performance appraisal |
| **Government bodies** | |
| GB | Poor implementation of performance appraisal |
| GB | The use of the internal promotion criteria is limited in the department |

## Sample Size

Since our target was to get information from senior managers of various ministries and government departments, it was easier to choose the sample. The main informants were managers who had good knowledge of HR policies, procedures, and how it is rolled out to employees. Refer to Appendix 1 for further details.

**Sample Size**: Out of the 26 interviews conducted in Samoa, all the informants interviewed in Samoa had spent less than 24 years in public service. The age range of all the informants interviewed was between 24 and 55 years. Out of the 18 interviews conducted in the Solomon Islands, 16.7% were females, and 83.3% were males. Approximately 89% of the civil servants had spent less than 24 years in public service. The age range of all the civil servants interviewed was between 24 and 51 years old.

***Data Analysis***: Thematic analysis was used to collect and analyze data. It is a research technique that is used to make valid inferences from the themes of textual materials (Clarke and Braun 2013). The main themes from the interviews were identified, and these themes were used as subtopics for discussing the four research questions proposed in this study (see Appendix 1).

## Theoretical Framework: Contingency Theory, Research Findings, and Discussions

This entry uses the Contingency approach to explore the HRM problems faced by the public sector of the Solomon Islands and Samoa. The originality of this entry is that it focuses on the SHRM in the public sector of the SIDSs as there is a gap in the existing literature and none of the existing studies have used the Contingency approach to SHRM theorizing to explore the problems of HRM in the public sector of the SIDSs (Brewster 1999).

### Contingency Theory

This paper uses the Contingency approach as the main theoretical framework to explain SHRM in the SIDSs. The Contingency approach stresses the importance of contingency variables (both internal and external factors) that impact SHRM in organizations. The Contingency approach is part of the SHRM as it involves aligning the HRM practices to achieve the business objectives of organizations. Companies need to undertake internal and external environment analysis in order to understand the changes in the business environment and how to undertake strategies to counter these challenges.

Figure 1 shows the contingency variables affecting HRM practices.

Studies have identified a number of factors that have an impact on HRM, SHRM, IHRM, and SIHRM. In summary, the first contingency variable is the "economic environment" that examines how the economic environment influences the HRM practices adopted by organizations (Schuler et al. 1993; Dowling 1999; Brewster 1999). The second variable is the "technological environment" that has an impact on human resource activities. The third variable is the "political environment" that affects employee's morale, motivation, and job performance (Schuler et al. 1993; Dowling 1999; Brewster 1999; Boyne et al. 1999; Cheng 2015; Arlbjørn et al. 2015; Ababneh 2016). Another variable is the "socio-cultural environment" that includes societal values, norms, beliefs, customs, and work ethics that affect the management of human resources (Schuler et al. 1993; Dowling 1999; Kalpazidou 2008; Cannaerts et al. 2016; Ohemeng 2010). The fifth variable is the public sector strategy, policies, and regulations adopted by the government departments (Pandey 2010; Overmans and Noordegraaf 2014). The sixth and final variable is the "internal environment" which affects the human resources of any organization (Jackson and Schuler 1995; Goldsmith and Eggers 2005; Dawes et al. 2009; Lodge and Hood 2012; Malatesta and Smith 2014). All these variables are fundamental in influencing the SHRM in organizations.

**Human Resource Management Problems and Public Sector Management, Fig. 1** Contingency variables affecting HRM practices. (Source: Created by the authors of this paper (2019))

Source: Created by the authors of this paper (2019).

With regard to the public sector, the literature shows three groups of contingency variables that impact HRM, and these three groups of contingency variables are (1) public sector strategy (Butler et al. 1991; Cappelli and Singh 1992; Begin 1993); (2) internal environment variables, such as size and structure of public sector (Jones 1984; Jackson et al. 1989; Jackson and Schuler 1995); and (3) external environment factors such as technology, global economy, and sociocultural and political factors (Schuler and Walker 1990; Schuler, 1995; Becker and Gerhart 1996; Boxall 1998; Dowling et al. 1999).

## Link Between SHRM and Contingency Theory

The subject matter of SHRM can be explained via the lenses of the Contingency approach (Woodward 1965; Dewar and Werbel 1979; Schoonhoven 1981; Van de Ven and Drazin 1985; Venkatraman 1989). In the contemporary changing business environment, the relationship between HRM practices and firm performance is no longer linear but has a matrix relationship (Martín-Alcázar et al. 2005). This paper argues that researchers would be making incorrect assumptions if they are examining HRM problems without accounting for the impact of both internal and external environments on these HRM problems. The inexplicable behavior of the internal and external environment gives rise to a range of HRM problems faced by organizations.

## Research Findings

The research findings from the two PICs reveal that both the internal and broader external environment factors have an impact on the HRM. There are some similarities and variations of HRM problems faced by the public sector of Samoa and Solomon Islands. Some of the common HRM problems faced by the public sector are financial constraints, inability to recruit and retain a skilled workforce, lack of ongoing training, poor pay and working environment, lack of employee voice and consultation, lack of top management support, and poor employee work ethic and attitude.

## Similarities in HRM Between Samoa and the Solomon Islands

This section explores some of the similarities in HRM problems faced by the public sector of the Solomon Islands and Samoa.

***Financial constraints***: According to Vo and Bartram (2012) and Van Gramberg et al. (2014), implementing HRM practices that enhance employee productivity and motivation requires allocation of the national budget for recruitment, training, and retaining a skilled and talented workforce. There is a lack of availability of financial resources to improve HRM practices in the public sector of Samoa and Solomon Islands. The previous study by Van Gramberg et al. (2014) have found finance as a significant problem. If financial resources are not available, it will be difficult for the government ministries to hire enough skilled and qualified employees at the right place and at the right time. One of the government officials from Samoa's Public Service Commission mentioned that:

> The government does not have adequate funds to recruit the right number of employees and meet the training needs of each of the ministries. This has been one of the problems restricting the acquisition of efficient and highly motivated employees [. . .]

Similarly, the government of the Solomon Islands has to run a budget deficit in order to meet the HR requirements of the respective ministries. According to one of the government officials from the Solomon Islands:

> The government of the Solomon Islands lacks the financial resources required to improve the public service functions. The donor agencies are providing the financial resources to implement HRM reforms, but this amount is not enough [. . .]

Both the Solomon Islands and Samoa rely more heavily on foreign aid from the donor agencies (such as Australia and New Zealand) to fund the government employee's salaries. According to the Organisation for Economic Co-operation and Development database (2016), the net official development assistance received by the Solomon Islands increased from $US 68,250,000 in the year 2000 to $US 198,510,000 in the year 2014. Similarly, the development assistance received by Samoa has also increased from $US 27,140,000 in

the year 2000 to $ US 92,740,000 in the year 2014.

The human resources in the public sector need to be financially sustainable in order to continuously deliver services that fulfill the people's demands (Wolfson et al. 2013). Furthermore, the benefits of spending on human resources must outweigh the cost. Accountants have always seen human resources as a cost factor and, as such, given low priority and importance to sustainable management and development of human resources. This paper adds to the debates on the cost and sustainability of human resources by Wolfson et al. (2013) and Barter and Russell (2013) published in the *Sustainability Accounting, Management, and Policy Journal*.

### Inability to Recruit, Train, and Retain the Skilled Workforce

Essentially, the public sector needs to employ talented and efficient employees to improve public service delivery. Citizens and private sector businesses expect excellent service delivery from government departments. The public sector needs to recruit qualified employees, train, and develop them effectively and efficiently to ensure long-term sustainability of the HRM (Wolfson et al. 2013; Barter and Russell 2013). The inability to recruit, train, and retain skilled workforce is another HRM challenge faced by the Samoan and Solomon Islands governments. In Samoa and Solomon Islands, the general education level of the population is much lower than in developed countries. Both the Samoan and Solomon Islands government gives scholarships to students to study in Fiji, Australia, and New Zealand. However, once these students graduate, they usually migrate to developed countries for better life opportunities. According to one of the government officials from Samoa:

> We lack skilled and qualified workforce, particularly in the areas of HRM and policymaking. The government is spending financial resources on educating the workforce at the University of the South Pacific and local institutions. Once these students graduate, they migrate to rich countries around the world because they can find better jobs in other countries [. . .]

The government officials made similar comments from the Solomon Islands:

> We have many programs that help the government officials to get a better education. In addition to this, we have the RAMSI machinery that provides technical assistance in the areas of HRM, policy-making and customer service [. . .]

According to one of the government officials from Samoa:

> It is challenging for the Samoan government to recruit and pay a higher wage rate to the civil servants and award them with promotions, increments and bonuses if they are performing above the required benchmark [. . .]

In the context of the Solomon Islands, the ethnic tension of the December 1998 has forced many civil servants to migrate to its neighboring countries. During periods of ethnic tension, it is difficult for the Solomon Islands government to retain skilled and qualified civil servants (Interviewees 30 and 36). Ethnic tensions negatively affect public sector employee motivation and job performance. This argument is parallel to the findings of the studies conducted by Cheng (2015), Arlbjørn et al. (2015), and Ababneh (2016). These studies also found that the political environment affects public sector motivation and job performance.

***Lack of employee collaboration and consultation***: Lack of employee collaboration and consultation leads to conflicts in the workplace, and this results in a hostile working environment. Many studies have found that a hostile working environment has a negative impact on employee morale and motivation at the workplace (Van Gramberg et al. 2014; D'Netto et al. 2014; Thirkell and Ashman 2014). If employees are not happy, employee turnover will be high, and this will be costly for the business in the long term. According to one of the public sector government officials from Samoa:

> I believe there is a lack of employee involvement in the decision-making process of public service. Sometimes employees feel they are not part of the public service because their views are not accounted for by the public service. As a result of this, conflicts arise at the workplace [. . .]

Similar HRM problems are faced by the public sector of the Solomon Islands. According to one of the government officials from the Solomon Islands:

> Around 70% of the decisions that are implemented in the respective ministries are made by the Ministry of Public Service Commission. Some of the decisions that are made by the Ministry of Public Service Commission that has a substantial impact on the operations of the different ministries are appointments, promotions, training and development and performance appraisal. Since the decisions are centralized at the Ministry of Public Service Commission, it is difficult for the ministries to involve its employees in the decision making the process [. . .]

The public sector of the Solomon Islands emphasizes on centralizing significant decisions at the Ministry of Public Service Commission so that the costs associated with decision-making can be reduced. Some of the costs associated with decentralized decision-making are (1) increase in turnaround time of public sector decisions and (2) opportunity cost of employees' time. All of these costs have indirect financial implications on the operations of the public service. This finding is parallel to the findings of the studies conducted by Pandey (2010) and Overmans and Noordegraaf (2014). These two studies have confirmed that centralization in decision-making is an austerity measure used by the policymakers to reduce the size of the public service operations.

In the case of Samoa, due to lack of technological innovation, it is difficult to involve employees in the decision-making process. It would be easier to involve employees in the decision-making process if the government implements an advanced HRM information system. The employment law of the Solomon Islands and Samoa does have clauses on employee consultation and collaboration, but the degree to which it is implemented is questionable.

Both Samoa and the Solomon Islands have a collective sociocultural environment where group decision-making is given importance over the individual decision-making. According to one of the government officials from Samoa's public service:

> At the community level, we make decisions in groups. I think it is difficult for employees to adjust when employees are not involved in the decision-making process [. . .]

The contextual factor of "lack of employee collaboration and consultation" links both to the strategic HRM framework proposed by Brewster and the Contingency perspective. Brewster proposed the strategic HRM framework by combining the "HRM literature" and the "comparative industrial relations" literature to analyze the HRM practices across countries. The contextual variable of "lack of employee collaboration and consultation" helps us to understand how the previous macro-level "industrial relations" environment (e.g., involvement of trade unions and employee voice) has changed in the public sector and being replaced by a new micro HRM system.

***Poor performance appraisal***: A good performance appraisal is one that can enhance employee productivity and motivation (Chiu et al. 2002; Pfeffer 2010; Albrecht et al. 2015). Several problems have been identified while developing and implementing the performance appraisal of the Solomon Islands and Samoa. The existing performance appraisal system of Samoa is poorly implemented. According to one of the government officials from Samoa:

> The job classification structure that was implemented in the early 2000s is currently outdated. This needs to be reviewed in order to meet the current context of Samoa. The performance management system is not fully linked to the rewards, and training and development needs of employees [. . .]

Similarly, the performance management system of the Solomon Islands also has several problems. One of the problems identified by the government officials is that there is a lack of awareness and little uptake of the performance management system among the government employees. One of the government officials from the public sector of the Solomon Islands mentioned that:

> Currently, there is a lack of awareness of the objectives of the performance appraisal system. The ministries do not want to take responsibility for completing the performance appraisals as they believe that it is the responsibility of the public service commission [. . .]

Technological innovation has a substantial impact on managing the performance appraisal system in the public sector of the Solomon Islands and Samoa. Currently, there is limited use of

HRM information systems in the public sector of the Solomon Islands and Samoa. The government of the Solomon Islands and Samoa will need a skilled workforce and financial resources to implement HRM information system in place. However, these resources are currently unavailable to improve the efficiency and effectiveness of the public sector. This finding is similar to the findings of the studies conducted by Singh et al. (2011), Farooqi (2016), and Jin et al. (2016). These studies also recognized that financial resources and a skilled workforce are needed to implement a quality-focused performance appraisal system. Furthermore, these studies also found that using innovative HRM information systems will enhance the transparency and accountability of public service delivery.

***Lack of Top Management Support***: Top management support is needed to implement HRM practices (Stanton et al. 2010; Thirkell and Ashman 2014). The goal of any national government is to improve the efficiency, effectiveness, and transparency of the public service delivery. This goal can be achieved if top management supports HRM initiatives. Top management support would involve providing financial and nonfinancial resources to implement productivity-enhancing HRM practices. One of the government officials from the Solomon Islands mentioned that:

> We need top management support to implement good HRM practices. Some of the issues that need immediate attention are improving the implementation of the performance appraisal system, redefining existing job descriptions and handling issues related to HRM [. . .]

The government officials made similar comments from Samoa. According to one of the government officials from Samoa:

> The top management has always been supportive of implementing good HRM practices in the public sector of Samoa. However, due to a lack of financial resources, sometimes they are not able to provide full support. [. . .]

The economic environment influences the type of top management support that is provided by public sector organizations to implement HRM practices. If the government has the financial budget to implement employee enhancing HRM practices, definitely they would allocate sufficient funds to implement these practices. However, if the government does not have sufficient funds to implement HRM practices, it would not provide financial support to each of the ministries to implement these practices. Similarly, the political environment should be supportive of encouraging top senior management public officials to implement HRM practices. This finding is similar to the evidence from the studies conducted by Psychogios and Wood (2010), Stanton et al. (2010), and Thirkell and Ashman (2014). These studies argued that HRM practices in public service should be aligned with the nation's human resource development strategies. This implies that top management support toward enhancing human resource practices is essential toward improving productivity levels of the civil servants.

***Poor employee motivation***: To implement employee enhancing HRM practices, we need employees who are receptive to changes at the workplace and who can adjust quickly to changes in the work environment (D'Netto et al. 2014; Van Gramberg et al. 2014). It has been noticed in Samoa and Solomon Islands that employees are slow in adapting to the changes at the workplace. According to one of the government officials from Samoa:

> If we are implementing best practices in the public sector to improve public sector service delivery, employees should accept those changes and understand that it is suitable for them and the public sector as a whole. If some practices are not suitable for them, surely it would not be implemented because the government does not want to harm the employees [. . .]

The government officials made similar comments from the Solomon Islands. According to one of the government officials from the Solomon Islands:

> It is difficult for employees to adapt to the new changes that we are trying to implement in the public service. We have noticed that employees feel insecure when they see that we are trying to bring in new practices in the public service. [. . .]

The sociocultural environment of the Solomon Islands and Samoa influences the employee attitude that they bring to the workplace. As compared to the culture of the Anglophone countries and its allies, employees in the Solomon Islands and Samoa are much slower in adopting changes in the work practices. According to one of the government officials from Samoa:

> Employee's attitudes at the workplace affect how fast they can adapt to changes in technological innovation. If employees do not understand the objectives of implementing HRM information system, it would be difficult for them to accept innovative technology to instill transparency and accountability in the public service [. . .]

The findings from this study are similar to the findings from the studies conducted by Moynihan (2006) and Fernandez and Rainey (2006). These studies also argued that poor employee attitude leads to a lack of acceptance of organizational change in the public sector.

## Differences in the HRM in Samoa and the Solomon Islands

The research findings show that there are some significant differences in the development of human resources in the public sector of the Solomon Islands and Samoa. The significant differences are in sociocultural, political, and economic features, and these differences have a bearing on the human resources in public sector development.

***Cultural/societal difference***: Samoa's public sector is influenced by the national cultural system of *fa'a Samoa* (*Fa'a Samoa* is the Samoan way of life.) and *fa'a matai* (traditional chiefly system – *Fa'a matai* are traditional chiefs as part of social stratification system of Samoa.). The ideology of *fa'a Samoa* requires people to be obedient, show respect to senior people, and not to question those in authority. *Fa'a matai* is a traditional social stratification system where the *matai* (chiefs) are the leaders and the people underneath them are "commoners." In Samoa, only people with *matai* titles (chiefs) are eligible to contest elections, and all ministers and members of parliament are chiefs. On the other hand, in the Solomon Islands, there are a few layers of social stratification, and they have a *wantok* system (*Wantok* in the Solomon Islands means people speaking the same language.) that has a bearing on HRM in the public sector.

***Political difference***: Samoa has been politically stable since it gained its independence in 1962, and this led to a steady development of its public sector and its human resources (Liloqula 2000). However, the Solomon Islands has had a troubled political environment (instability) as it underwent ethnic civil conflict between 1998 and 2003 that derailed the public sector development and, in particular, its human resource (Nanau 1998; Liloqula 2000). The most recent instability was in April 2019, whereby local people created a riot in the capital city of Honiara in the Solomon Islands.

***Economic differences***: The economic positions of the two countries are also different which has influenced the development of HRM in the public sector. Samoa was ranked at 104 in the year 2017 Human Development Index Report, while the Solomon Islands was in 152 places (United Nations Development Programme 2018). Likewise, the gross national income (GNI) for the Solomon Islands and Samoa in the year 2017 was 6390 and 2270 PPP dollars, respectively (World Bank 2018). From these statistics, it is fair to say that Samoa currently enjoys a higher standard of living than the Solomon Islands. With a higher GNI and HDI, the Samoan public servants get decently higher salaries than their counterparts in the Solomon Islands.

***Overseas training opportunities***: There is a slight difference in the types and forms of training opportunities provided to the public servants in the Solomon Islands and Samoa. For instance, the public servants from Samoa have several opportunities for training in New Zealand, whereas the public servants from the Solomon Islands may not be having these opportunities. This has a positive impact on the intellectual capital of the Samoans as many of them are educated or trained overseas and can migrate to New Zealand under existing special immigration quota arrangements.

This paper has used the case studies from the Solomon Islands and Samoa's public sector

to discuss the political, cultural, economic, and historical differences. Hence, it is argued from the above discussions that the "contingency factors" of HRM problems faced by the Solomon Islands and Samoa are also different.

## Theoretical, Organizational, and Practical Implications of This Paper

Theoretically, one of the significant contributions of this study is that it adds to the theorization of SHRM from the perspective of the SIDSs. A close synthesis of the existing literature shows that the existing theorization of SHRM has mainly focused on the empirical data from the large developed Anglo-American countries (Poole 1999). One of the significant contributions of this study is that it does not take into account the unique social, cultural, economic, and political factors present in the SIDSs. Notably, after examining the context of the SIDSs in this paper, it is clear that variations in the use of SHRM practices exist in different geographical regions.

Moreover, this paper also stresses the importance of using contingency lenses in the theorization of SHRM. The Contingency approach stresses the importance of Contingency variables (both internal and external factors) that impact SHRM in organizations. The Contingency approach helps in the theorization of SHRM as it highlights the importance of internal and external environments in influencing the SHRM. The internal and external factors in SIDSs are different from those found in large developed countries.

This paper also bridges the gap between theory and practice by examining the concrete empirical data from the two SIDSs (Poole 1999). Similar studies in other SIDSs should be conducted, and research findings can be compared across geographical regions.

In terms of public policy management, senior government officials in developing countries can undertake a proactive strategy to address the difficulties related to managing internal and external environmental factors so that strategies can be designed to use human resources to improve public service delivery. Training is needed for senior civil servants to enhance their strategic thinking and policy analysis and design skills. The evidence reveals that the lower-level employees in the public sector of Samoa and the Solomon Islands have numerous problems, and these include lack of education and skills, inadequate and poor training, lack of employee consultation, and poor employee attitude and work ethic. For example, with the improvement in online technology and increased access to the internet, citizens are demanding improved public service delivery by using an online medium. Before innovative technology is used to deliver public services, employees have to be trained in the use of innovative technology.

At the organizational level, the implications of this paper are in threefold. First, top management support is needed to encourage employee voice, consultation, and participation. Employees need to be consulted during the decision-making process in order to encourage civil servants to think innovatively on improving public service delivery. Second, top and middle management should continuously train civil servants so that they are well versed with changing rules and regulations, public policies, procedures, processes, and adoption of new technology. Third, management needs to consider decent pay and working conditions in the public sector of the Solomon Islands and Samoa so that civil servants are motivated, have high morale, and provide better service delivery. Poor employee attitude, morale, and work ethics will cause conflicts, and this affects the productivity of civil servants. Therefore, to increase productivity, human resource managers need to modernize HRM practices and encourage employees to think more flexibly.

At the societal level, this study can guide government policymakers to improve public service delivery by listening to public views and perceptions. The main aim of any public sector organization is to provide efficient, effective, and high-quality public service to the citizens of a country. This will benefit and raise the quality of life of people, and continuous delivery of high-quality service will ensure that the benefits of public service are sustainably spread between

current and future generations. Finally, this study can contribute to research and teaching of public sector courses in several tertiary institutions in the Pacific region. Case studies can be developed to enhance teaching materials.

## Conclusion and Limitations

The main aim of this paper was to explore the HRM problems faced by the public sector organizations in the Solomon Islands and Samoa. This study used the Contingency approach to examine how the contingency variables (internal and external environmental factors) have an impact on the HRM problems faced by the public sector of the Solomon Islands and Samoa. The findings from this study showed that there were some similarities and variations in HRM problems faced by the public sector of Samoa and the Solomon Islands. Some of the common HRM problems faced by the public sector of Samoa and the Solomon Islands are financial constraints, inability to retain a skilled workforce, lack of skilled workforce, lack of ongoing training, poor working environment, lack of employee collaboration and consultation, lack of top management support, and poor employee attitude.

The employment law should support employee enhancing HRM practices in the public sector of the PICs. An employment law that balances the employee's and employer's interests will ensure that the senior public service government officials provide support to the HRM initiatives. This finding is similar to the findings from the studies conducted by Psychogios and Wood (2010), Stanton et al. (2010), and Thirkell and Ashman (2014). These studies argued that HRM practices in the public service should be aligned to the nation's employment law. This implies that top management support is crucial to solving the numerous problems faced by the public sector of the SIDSs. It is essential to study the context of the SIDSs as it reveals the peculiarities of internal and external factors that are unique to the PICs but cannot be explained by the mainstream Anglo-American SHRM literature. As discussed above, the Anglo-American SHRM literature is based on the empirical studies conducted on large developing countries. The universalistic "best" HRM practices cannot explain HRM practices in the SIDSs. The contribution of the paper is that it adds to our understanding and theorization of strategic HRM. One of the limitations of this study is that generalizations from this study cannot be made for all the PICs because this study was only conducted on two PICs. Future researchers should conduct this type of study in other PICs so that generalizations can be made across geographical regions.

## Synonyms

HR management; Value creation; Visibility

## Definition

**Human resource management visibility** builds innovative solutions for employees, managers, and stakeholders. This is through strategic application of HR systems to deliver institutional goals in consultation with the leadership team to deliver joint workable solutions for sustainable competitiveness.

## Introduction

A number of organizations have registered success by not only adding value to their products but to institutions, employees, partners, investors, and outsiders in the communities they serve. This is largely attributed to the transformation in their people management system. Human resources management (HR) has made tremendous technical advances over the years and is being used as a great strategy to change and make institutions competitive over their counterparts (Choi 2019). This HR function has evolved from administrative and policy compliance roles to matters relating to strategy. This in effect has impacted the delivery of business goals as well as innovative solutions to business challenges. It is a critical success factor in institutions where employees, managers, and other stakeholders need to exploit it for organizational advancement. It has kept institutions relevant in the employment world by enabling them to stand the test of time in a hostile business world (Munene and Nansubuga 2017).

Previously, institutions hinged their success on technology, marketing, and capital accumulation which has since changed due to advancements in scientific knowledge and a shift in the work force pattern. Global instabilities in business operations, coupled with economic uncertainties, have compelled institutions to turn to HR to deliver value. Initially, the function focused on routine administrative tasks whose value addition was questionable. In order to address this, institutions have undertaken efforts to utilize this function innovatively and effectively in finding solutions to their problems (Wiegratz 2009). In order to understand the function, it is important to examine it historically.

## Historical Viewpoint of HR

HR can be traced to prehistoric times where the Chinese crafted methods of choosing tribal chiefs for leadership roles during wars. In like regard, the Greeks applied apprenticeship systems to select the best workers for the different "industries." It was mandatory for the systems to adhere to the health and safety standards of the time between 2000 and 1500 B.C. Through prehistoric times to the post-modern era, there has been a growing demand for actions that necessitate the selection and training of individuals for specific jobs. Specialists in this area have been called personnel managers/administrators, which term is still in use but with variations. Their roles included recruitment, selection, training, salary administration, and industrial relations, among others, which were executed but with limited association to organizational activities and objectives (Rotich 2015).

In Africa, formal employment which is the yardstick of HR started with the colonial administrators who sought services of the local people as clerks, cleaners, and messengers in government offices. Over time, the services were extended to the service and manufacturing segments. It is for this reason that formal employment (Odette and Ogochukwu 2010) in postcolonial Africa was designed along the inherited colonial systems where the British and the French followed the Anglophone and Francophone models, respectively. As time went by, the systems evolved organically in response to social, political, and economic dynamics. The function was initially dominated by transactional work, including payroll and benefit administration; however, today it focuses on strategic initiatives like mergers and acquisitions, talent management, succession planning, industrial and labor relations, ethical considerations, diversity, and inclusion (Obedgiu 2017).

Owing to business dynamics, the function has shifted to emphasize a problem-solving approach which earmarks institutional challenges by putting emphasis on diagnostics; acknowledging reforms as best approaches in challenging contexts; the need for rigorous empirical work on what works; and a concentration on the best fit solution. These are achieved through ensuring that all employees are brought on board and schooled in HR rigor. They can easily tell whether they are hitting targets or not, working on tasks to pave a way for other employees to begin their own, as well as ensuring team performance (Idrees et al. 2018).

## The Concept of HR Visibility

There have been various schools of thought in regard to HR visibility where scholars view the concept differently. This arises from the fact that institutional challenges are not homogeneous and as such they require varying forms of strategy to ensure competitiveness. In some firms, employees including managers have been known to speak the HR language such as setting and meeting targets and starting and completing tasks before taking on others in order to maintain credibility, among others (Munene 2012). The perception is a departure from the traditional notion of what the HR department, practices, and people have done for most of the time which centered on performance. Customarily, the function was known for strict administrative precision, hence performance, which has since transformed from performing to delivering value. This has changed the out-of-date terrain of the people relations professionals, practices, as well as the department(s). The delivery stresses the importance of outcomes, guarantees, and results which can be summed up into categories of deliverables including strategic execution, administrative efficiency, employee contribution, and capacity for change (Ulrich et al. 2017). The concept of HR visibility is conceptualized differently no matter how each individual perceives it, but the bottom line is that it must look at the function through the aspects discussed below.

## HR Visibility Attributes

### Strategic Position

Strategic positioning is associated with maintaining and establishing a distinctive place in the market with regard to the future while, at the same time, taking into consideration the changing micro and macro organizational environment. Placing HR in this tactical location paves the way for attracting attention which enables it to acquire a leadership role of guiding the institutional affairs. This is undertaken by putting in place the relevant processes, placing appropriate talent in the right infrastructure (Ulrich et al. 2017). Positioning HR strategically makes it central, which enables it to optimize its strengths in augmenting performance. It facilitates the harnessing of the hidden potential within its informal social architecture including unspoken knowledge, cooperation, and casual learning that emerge over a long period of time. Occasionally, the informal culture may override the formal; it is incumbent upon managers to ensure that the formal and informal settings are encouraged and supplement each other to produce the desired outcomes. In achieving this, HR must serve as the administrative expert which it has always been. The understanding here is that it helps in

providing leadership through creating appropriate substructures for institutional HR re-engineering which puts in place appropriate policies and business processes that support decisions concerning the best equipment and human capital for effective value creation (Ulrich et al. 2017).

### Strategic Partnerships

A number of definitions have been advanced to describe strategic partnerships where various schools of thought (Wilkins 2020) relate the concept to "partnerships of choice" and "partnership of necessity." These have emerged to emphasize flexibility to the desired agenda. Reliance on strategic partnerships (joint ventures, alliances, and mergers and acquisitions) has significantly boosted the emerging markets, helping to realize the strengths of relationships. In ensuring the effectiveness of strategic partnership, it is prudent for players to attach and uphold associations within institutional structures as a way of legitimizing activities of different players. The structures must be kept intact to avoid resource misappropriation. In addition, HR systems have been aligned to business strategies and other institutional functions as a means of leveraging one another. It is hence prudent for HR executives to form alliances and partner with other line managers to form consortiums of engagement to translate business strategies into action. Strategic partnerships empower HR professionals to work with other line managers to institute and manage change processes. This involves crafting approaches based on knowledge of current and future customers and exploring how corporate resources may be aligned to those demands. A case in point is when items are deemed not necessary on the market and HR managers are required to source new labor to produce what is relevant or redesign what is available in response to customer demands (Ulrich et al. 2017).

### Stakeholder Expectations

Stakeholder expectations play an important role in influencing change by contributing to decision-making and building up motivation as well as awareness. These are derived from the working environment which informs the different levels of importance each commands to influence change (Balador et al. 2018). During the process, their interests and expectations must get due attention. Mason and Simmons (2014) argue that they influence institutional philosophy and practice which impact performance. This is through interactions that place importance on logical relationships that meaningfully stimulate productivity to influence the valid interests of the parties involved. In the event of failure to address the expectations, they turn into hate-holders, which is dangerous for institutions. There are both internal and external stakeholders whose viewpoint and practice influence growth and competitiveness. Depending on the type, as earlier mentioned, they have interest; and arising out of this, they are bound to anticipate dividends from the institution which do not necessarily have to be in monetary form. Institutions can then adopt HR strategies but cognizant of their contribution to the different stakeholders, which benefits establishments (Luoma-aho 2015; Balador et al. 2018).

### Social Transformation

Social transformation is about a need for de-ideologization and change of the traditional ideology among stakeholders and different players. The different actors in this situation are duty-bound to account for the alteration and own the outcomes through accountability and newly adopted culture. HR has changed over time, from policy compliance to the board room, a strategic partner, and now a visible actor in institutional management credited with causing change(s). Choosing, placing, and tasking HR with such responsibilities is an indication that the function has achieved the trust to deliver at a high level of expectations from its contribution to turning facilities around. The status of the function that is created as a result is bound to create long-term superior value (Munene and Nansubuga 2017).

## Strategies

One of the major approaches of engaging HR visibility involves a universal perspective of ensuring that best practices are adopted to optimize performance. It works on the assumption that the workforce is comprised of employees

with homogeneous core values which focus on the individual competences that directly inform performance. Institutions the world over have been able to achieve this by putting in place policy guidelines which are effected through management to the effect. In addition, roles of the different functions are clarified to ensure that each of the functions and the persons involved are ably clarified to avoid any encumbrances. The method stresses the importance of unified practices as key to institutional competitive success.

A number of scholars have highlighted the importance of aligning HR practices with other business strategies to augment performance. Within this framework, HR visibility is primarily concerned with the development of an organization's capability to adapt to the changing environment. However, much as there is need to align practices with business strategies, there is also need to ensure that all those concerned appreciate the importance of the function. The appreciation of the function by all those concerned leads an aggregated institutional performance. If a firm's HR enables it to be in a competitive situation, then it causes it to be a source of superior performance. The workforce should ensure that HR strategies create a shared mindset for core workers. Management is duty-bound to share business ideology with all the workers and other stakeholders. All managers should be skilled into the importance of HR to the organization. When this is implemented, it will ensure that HR is appreciated and will not be resisted; for if the strategies are resisted, performance is hampered.

## Challenges

The concept of HR visibility is a comparatively less explored area. As such, institutions in general are facing challenges of embracing it which need to be addressed. These are highlighted in the following concluding paragraphs.

Resistance to change is a factor that is afflicting the practice. There is institutional rigidity in adapting to new trends; policies take long to be aligned to the function, resulting into non-attraction and less value in the African context. Preference is accorded to the traditional functions of finance and marketing and IT in the developed world.

Not all institutional challenges require an HR solution. The tendency to this assumption has on many occasions led to disillusionment among practitioners. However, this is not the case and, on many occasions, environmental factors, including nepotism and corruption which may not require such solutions, have played a part. Whereas establishments in the developed world are well structured and not easy to abuse, the opposite is the case with their counterparts in the third world where such vices thrive due to failures in observing established systems.

Positioning the function strategically is another factor which has been misunderstood. Workplaces are under the notion that the strategy is aimed at reducing other functions' relevance at a macro level and disempowering CEOs in the organization. There has been abuse to strategic positioning where personalities are preferred instead of the positions. When friendships are replaced with strategic positions, it means that the cessation will lead to the loss of position relevance.

## Recommendations

Organizations should consider investing in HR visibility, not only because it makes them competitive but also keeps their employees attractive. During the process they need to consider the following:

There is great need for institutions to accept change and appreciate the new roles adopted by HR. In ensuring that line managers appreciate the relevance of the function, the technical staff will not find it difficult to adopt its recommendations and as such implement the day-to-day activities.

Institutional management is duty-bound to ensure that managers are schooled in issues relating to HR. The old thinking of perceiving the function as performance-based needs to be replaced with one where it is expected to deliver value. It is therefore necessary for the managers to translate the value into outcomes.

In order to realize HR visibility, there should be deliberate efforts to ensure that its position in the organization is strategic. A case in point is that the senior HR manager or director reports directly to the CEO. In so doing, this will ensure that HR-related issues that lead to institutional transformation are addressed.

## Conclusion

Conclusively, there is optimism regarding the present and future of the HR function. This entry shows the power of the HR function in contributing to business partnership and institutional change. Philosophically, there is need for managers and practitioners to ensure that the people management function has clear roles and is socially accepted and practitioners have the competence to execute the laid-out tasks and duties while ensuring that the function is accorded the position it deserves. This then paves the way for competitive institutions through concerted efforts in the working environment.

## Definition

The effect of new public management in public servants productivity, the case of Greece.

## Introduction

The contemporary socioeconomic conditions and the constantly increasing demands for higher growth rates form the perpetual need to improve the administrative function of the public sector (Aspridis 2013). The implementation of the advanced administrative theories of the new public management and public governance, which represent to a great extent a businesslike approach, defines the transition from the bureaucratic public administration to the effective, flexible, and extrovert public management (Boyle 2006; Goldfinch and Wallis 2009). The case of Greece, due to the peculiar conditions that have been formed under the adverse conjunctures of the economic crisis on the one hand and the chronic malfunction of public administration on the other hand which constitutes an obstacle to the socioeconomic growth of the country, makes it imperative to find effective solutions in order to normalize the working of state mechanisms. An extremely topical problem of the Greek public administration is the issue of workforce productivity. This particular problem tends to grow to an excessive degree in the present memorandum era, because of the multifaceted parameters that comprise the foresaid situation such as job disappointment caused by the economic crisis, static ineffective planning, absence of modern administrative and organizational practices, anachronistic legislation. The attempt to improve civil servants productivity could significantly boost administrative reorganization, economic growth, and the overall social recovery, actively contributing to the reconstruction of the Greek state.

In the last decades several efforts have been made to formulate and operate a complete evaluation system of human resource performance in public administration (Buelens and Van den Broeck 2007). Unfortunately, these attempts have not succeeded to formulate an effective performance evaluation system. The continuous improvement of civil servants productivity has been the focus and continues to concern the Greek legislator. The present study is going to try to approach the predominant factors of low workforce productivity in the Greek public administration and the consequent poor effectiveness of public administration, to analyze and assess the reasons of these problems and finally to make suggestions to improve the present situation.

## Analysis of the Administrative and Legislative Frame Relating with the Productivity of Civil Servants

Since 1975, during the period of the third Greek democracy, several efforts have been made to formulate and operate a complete evaluation system of human resource performance in public administration. The most significant efforts and their modifications were the following: Presidential Decree 906/1975, PD 16/1977, PD 581/1984, PD 318/1992, L. 2085/1992, L. 2683/1999, L. 3230/2004, L. 3528/2007, L. 3620/2004, L. 3839/2010, L. 4024/2011, L. 4250/2014. Unfortunately, none of these 11 attempts succeeded the initial aim that was not other than formulating a merit-based and objective performance evaluation system that would contribute to decision making concerning the workforce of public administration.

The productivity issue, or to be more precise, the continuous improvement of civil servants productivity, has concerned and continues to concern the Greek legislator. In the present analysis an attempt will be made to briefly present five of the most important laws concerning the wider issues of management by objectives, the performance evaluation of civil servants, and the selection process of executives, distinguishing an organic interconnection among them.

The most important law concerning management by objectives was the homonymous legislation, the L. 3230/2004 about "establishing administration system aiming at the measurement of efficiency and other provisions." In particular,

attempts have been made to establish a mechanism measuring administration efficiency and efficacy by measuring indicators (general, specific, qualitative, and quantitative) for all the subordinates and superiors. Moreover, an objectives framework was formed, quite innovative for the Greek administration reality, which lacks public officials' transparency and accountability, connecting the goals of administrative structures with the employees that staff the relevant structures (Karkatsoulis 2014).

Despite the positive features of that law, its implementation remained problematic and incomplete. The main reason for this incorrect application was the –after all – nonmandatory nature of the law implementation due to the lack of sanctions when it's not implemented, the non-issuance of the necessary presidential decree specifying the exact goal-specification process and the actual failure to set up quality and efficiency departments within the ministry.

A third important legislation related to the wider issue of civil servants productivity is the law 3839/2010 "New managers selection system." The most important feature of this law consists of the introduction of a rigid but meritocratic system of bonus points for the typical (primarily) and essential (secondarily) qualifications in order to select the heads of organic, administration units. More specifically, a special managers selection council has been established as part of the legislator's attempt to fortify an institutional framework for the selection of general managers and to protect this crucial issue from the influences of the clientelist system. At the same time, the Law 3839/2010 related the managers selection to the (poor, however) assessment of their service potential (Katsimardos and Bouas 2011).

The L.4250/2014 was a rather differentiated although finally nonapplied measure. The most important characteristic of this law was the introduction of a quota system in the form of maximum percentages per rating scale at general management level ((a) up to the 25% of the employees are marked with scores between 9 and 10, (b) up to 60% of the employees are marked with scores between 7 and 8, and (c) up to 15% of the employees are marked with scores between 1 and 6). The attempt to introduce the aforementioned system, which had been declared temporal and transitional and whose main goal was to limit the phenomenon of excellent evaluations misuse, met strong reactions and finally was not implemented.

The most recent law concerning the evaluation of workforce performance (that is in force at the given time) is the Law 4369/2016. This law abolishes the quota system introducing an evaluation system of civil servants efficiency on the basis of which the typical qualifications of civil servants are associated with the actual performances as determined by the two hierarchical superiors (by drafting evaluation reports that take into consideration the following three aspects: subject knowledge – professional relations/behavior – effectiveness). The particular system has not been applied yet. Nevertheless, several positive elements emerge as well as specific deficiencies such as particularly high points awarded for typical qualifications (which are not directly related to the actual effectiveness) and the subjective judgment of evaluators (given measurable, objective elements of the employees performances do not exist in order to secure the meritocratic evaluation of the subordinates).

## Pathogenic Environment of the Greek Public Administration: Reasons and Weaknesses

### Problematic Organizational Planning

The Greek public administration is characterized by high centralization of decision making at senior administrative positions and mainly at the political level (Makridimitris 1999). The role of the administration is limited to execution. The competencies of administrative executives that possess positions of responsibility are usually confined in handling documents while decision-making belongs almost entirely to political leadership. This applies even on purely administrative issues related to daily functions of public organizations (Karkatsoulis 2004). It becomes obvious that since the administrative hierarchy does not perform administrative duties, there is neither the

possibility nor the motive for taking initiatives leading to efficiency and productivity increase (Vandenabeele 2007).

Furthermore, the extensive legalism constitutes significant organizational pathogenicity. Laws, regulations, and typical procedures, accumulated as time goes by, define in extreme detail the work of public administration, leaving little space for policymaking or motives for it (OECD 2011a). Therefore, there are not any margins of discretion required for the activation of administrative operations and procedures geared to the outcomes. Given that productivity is directly linked to results measurement, it is obvious that the legalism and formalism culture do not allow for such arrangements (Starling 2010).

The fragmentation of the administrative tasks in the fragmented structures combined with the lack of standard procedures contributes to the complete failure of coordination, despite the high centralization of the decision-making system (OECD 2011a). The ministries function as *silo*, whereas horizontal communication is hampered due to the lack of a relevant culture as well as because of the very lack of interoperable technological systems and applications. Lack of coordination leads to fragmentary, covered, and conflicting activities and administrative actions which reduce productivity and constitute an obstacle to the implementation of coherent public policies.

## Deficient Measurement and Human Resource Management Systems

In Greek public administration the percentage of employees classified as excellent is very high, resulting from the growing fear of the assessment effects. The natural consequence was the failure to connect the evaluation with employees' efficiency and productivity. Most of the evaluation systems were overwhelmed by standard criteria with predetermined significance characterized by vague wording and ambiguous adjectives (Rossidis 2014). Most of them referred to the personal qualities of employees and not to the work performance. Nearly all evaluation systems were characterized by egalitarianism in grading, leading to absence of differentiation in grading, personalization of evaluations, and most importantly to incomplete personal motivation and development frameworks as well as to persistence of the seniority system for promotions (Aspridis 2004).

The Common Assessment Framework (CAF) was another lost chance for the Greek public administration through the capacity to exercise self-evaluation based on real data. The CAF was a harmless tool because it was descriptive and recorded the necessary actions for organizational improvement in detail. On the other hand, it was quite bureaucratic because it required large amount of data. Measuring performance is an essential stage of performance management "during which it is essential to find out where we are in relation to where we want to go, by associating performance administration with performance improvement and development. Performance administration has to take into consideration the pathogens as well as the specific characteristics of Greek public administration which proposes assessing persons and not organizational structures, the existence of an institutional labyrinth about the staff of public administration and finally the respect for many, different authorities and categories of civil servants" (Aspridis et al. 2014: 21).

The public administration transition from a complicated bureaucratic public organizations cluster characterized by insistence on complying with procedures to a state headquarter which will offer qualitative services via the most effective possible administration is strictly necessary. This transition can be accomplished by the firm pledge to achieve the highest possible effectiveness and efficiency. According to an OECD study (1997), the necessary prerequisites for implementing successfully performance administration are the following:

- Managers should learn how to manage.
- Managers should be allowed to manage.
- Policies should be de-linked and organizations should decentralize.
- We need to focus on the programs instead of the organizations.

Transformation of organizations to bodies executing differentiated programs may enable the state administration to successfully control public administration efficiency maximizing the expected results.

Efficiency management may contribute to the development of public administration activity focusing on the overall improvement of its function. At this point it should be noted that efficiency management in the case of public organizations is a more difficult process than in the corresponding case of private businesses (Dixit 2002). As shown above, performance management in the public sector entails significantly more parameters than in the private sector making the particular procedure extremely more difficult.

### The Necessity to Depoliticize Public Administration: Review the Partnership of Trade Unions in Personnel Management

According to Professor G. Mavrogordatos (1983), "clientelism" refers to a particular way of social and especially political organizing, where the main structural component is the relationship between the patron and the customer. Clientelism continues to form and affect public policies due to the state's employer role, assumed since its very foundation; an employer who tried to combat unemployment by creating job positions. The effort to acquire power was the main concern of the political parties through the years. Parties of power identified with the state, equivalent to what happened in the Soviet Union where the party was the state. The narrow and broader public sector was inflated but elite was not formed corresponding to that of the French ENA. Therefore, it had to cover the clientelistic demands of citizens-customers who voted according to the promises and the parties' demagogy and not based on political programs. According to the Greek philosopher **Kondylis,** clientelism, as formed, hindered a balanced capitalist development and hence the proper human resource development in the private as well as in the public sector (Lymperopoulou 2016; Kondylis 2011).

The configuration of the parasitic civil service system which is based on clientelism and dependence on various political parties started from the foundation of the Greek state. Civil servants were unaware of key management models and were uneducated, trying to serve personal and local society interests. Therefore, they objected to the evaluation which they considered a punitive and unfair process, since it would reveal shortcomings and problems in the realization of their work within the organization framework. This mentality went on and still exists today. On the other hand, the political party that managed power each time did not try to develop an effective evaluation system that employees in public administration would accept and trust and which would establish meritocracy in all levels.

Evaluations systems either legalized pre-taken decisions or did not contribute to the development of public administration because superiors were appointed by the minister's decision each time. The evaluation process of the human resource efficiency was discredited; the representatives of civil servants union branches considered that these placements were made with the sole aim to save the *crony* from the negative assessment percentage.

Even young politicians, both at local and national level, who believed that they should work based on the best practices of the private sector and that they should develop evaluation systems that would contribute to the increase of productivity, once they acquired power, they changed their rhetoric and they did not realize their visions and accepted the previous situation, at the altar of clientelistic relationships.

### Lack of Civil Servants Training and Education

A particularly important element that composes the pathogenic environment of the Greek public administration is the lack of staff training and education (Pasas and Chekos n.d.). Dimensions of education refer to both purely technical knowledge and administrative skills, in order to educate executives on administration of departments and directorate. In its current form the educational process in the Greek public sector heavily relies on "on the job training." The specific procedure consists indeed of a quite recognized and popular vocational training system, but it is a process of a quite uncertain effectiveness as it is up to the

availability, sufficient time and validity of each employee's knowledge who undertakes the trainer's role alongside his ongoing duties. In the Greek case, this system contributed significantly to intensify phenomena of sciolism or of complete ignorance of basic knowledge about a civil service function, inflating in this way, the problem of low efficiency of state mechanism.

At a time when many countries focus on growing leaders (OECD 2011a), in Greece this strategic approach that would provide the possibility of increasing the capacity levels of human factor, supporting the operation of personnel management in public sector, is entirely extinguished. Providing targeted training managers, aiming at cultivating leadership qualities, could lead public administration to particularly high efficiency levels (UN 2007).

In addition, it should be noted that the Greek public administration is severely lacking in the configuration of clear job outlines, making the work of human resources vague and so the knowledge required for the valid and complete processing of a job is indistinguishable (Rossidis 2014). In this emerging environment, there is one more limiting factor that affects the effort to increase civil servants productivity, making the process of detecting and dealing with the human resources training needs extremely difficult.

The deficient implementation of knowledge management systems combined with the existence of problematic communication channels makes knowledge selection, storage, management, and transfer between staff and services extremely difficult, significantly reducing the potential level of efficiency. This knowledge and information outside their undeniable value for the final output results are key elements that define the administrative reforms being undertaken and become necessary for the preparation of the employees regarding the upcoming changes. This particular item is one of the main obstacles to successful implementation of administrative changes in Greece, hampering to an excessive extent the prospect of achieving decisive reforms that will lead the country to exit the crisis.

## The Approaches of the External Observers: Good Practices, Toolboxes, and Suggested Solutions

At international level, the debate on public sector productivity focuses on two sets of issues: The first is related to public sector contribution to the overall economic development, while the second one is especially related to the public sector profitability per se. In most countries the public sector represents about 20% of GDP. This figure is in many cases greater than the contribution of the industrial sector (OECD 2007a). Beyond the direct contribution to the economic development, public sector indirectly affects economic development. Many of the services provided by the public sector affect economic growth and productivity. In addition, citizens constantly demand better services while they are not prepared to pay more taxes. In order for governments to respond, they must find ways to do more with less (*"doing more with less"*).

Unlike the private sector, there is no price system in the public sector while services are consumed collectively. There is therefore difficulty in measuring the outflows and the outcomes of the public sector. Traditionally, for the majority of countries, the public sector productivity in national accounts appeared as zero (Boyle 2006). The measurement of public sector productivity was based on the assumption that the outflow of the public sector should be measured with regard to the generated value and not their cost (Atkinson 2005). Linking outflows with the outcomes and the formation of a series of quality and performance indicators helped a series of systems and techniques of measuring public sector performance gradually take shape.

Overcoming the problem of measuring performance is important as it creates the conditions for introducing a series of tools and techniques of inciting and supporting performance. The particularity of correlating incitement, motives, and performance in the public sector lies in the difficulty of measuring performance (Festre and Garrouste 2008). If productivity in the public sector can be defined and measured, then there is no obstacle to the application of methods and tools of

stimulating performance that apply to private sector organizations.

At international level, the effort to strengthen civil servants productivity fits into the wider framework of introducing comprehensive performance management systems (OECD 2007b, 2011b). Regarding human resources management, performance systems focus on three issues: appointment/placement and managers' promotion, retention of qualified managers, and practices for interconnection and aligning the personal objectives with the organizational objectives.

Staffing positions of responsibility with qualified personnel is a basic prerequisite for productivity increase. It is particularly important that staffing is based on qualifications and skills as described in the outline position and not on party or political criteria. The politicization of the selection criteria constitutes a main risk of degeneration of performance management mechanisms (Halachmi et al. 1987). Given that the political involvement cannot be completely ruled out, external bodies and control institutions should exist so as to ensure the necessary counterweights.

The results of performance and evaluation measurement should be reflected in decisions on promotions (OECD 1997). International experience shows that recognizing and awarding results through promotion is equally, if not stronger motive for productivity increase than earnings (OECD 2007b). At international level, conventional development seniority-based systems tend to be replaced by career-based/performance-based systems reflecting the need for a link between productivity and development. Introducing and using individual performance contracts with regard to senior managers is a widespread practice for strengthening productivity. Individual contracts have to do with specific positions within public administration and after their expiration the employee returns to his original position.

Retention of skilled workforce is more important to overall productivity growth than the incitement to achieve individual objectives. Ensuring adequate pay and satisfactory working conditions so that talented executives remain in the public organization is a significant factor that increases productivity. Introducing total reward systems (Livingstone 2011) is one of the most widespread tools of human resources management that contributes to the retention and development of competent staff.

The connection of the individual with the organizational goals is the biggest challenge for the introduction and implementation of effective performance management systems. The complexity of civil services organizational environment does not help clear connection of individual with organizational goals (OECD 2011a). Executives' high degree of technical qualification often leads to principal-agent problems. Manipulating targets and results is the greater risk for performance management systems that aim at productivity growth.

To sum up, the effort to increase productivity internationally is attempted by introducing integrated performance management systems. Nevertheless, these systems are not panaceas as their effectiveness depends on several prerequisites. The formation of a performance culture is perhaps the most crucial milestone so that performance management systems that increase productivity can be successfully introduced.

## The Difficult Task of Integrating the Proposed Reform Ventures: Solutions and Perspectives

Greece, which is bound by Memorandum commitments, is called on to improve the efficiency and productivity of civil servants so that implementation of promoted reform attempts can take place (Katsimardos et al. 2011). The successful implementation of reforms depends, mainly, on the contribution of the human factor in the implementation process of planned changes, actively supporting the country's way out of the economic crisis. Administrative changes should include a number of organizational dimensions, for example:

- Drastic changes in the legal framework aiming at the improvement of human resources productivity

- An overview of organizational planning
- Focus on designing effective measurement and management systems of human resources performance
- Depoliticization of public administration and review of trade unions participation in process of human resources management
- Upgrade the role of personnel education and training aiming at improving skills and the overall improvement of production dynamics
- Integration of good practices, new administrative tools, and contemporary practices as defined by international and European organizations

The aforementioned pursuits identify the difficult task of the human factor in keeping up with the strategic objectives of the Greek public administration and consequently hampering the effort to fulfill key reforms. Inefficient personnel management and the inability to perform necessary breakthroughs in public sector functioning decisively contribute to the configuration of the current administrative quagmire that prevents the country from escaping the economic maelstrom.

## Conclusion

Greece, despite being in an extremely unfavorable position, has the opportunity to achieve particularly impressive administrative changes by significantly improving the level of staff productivity, contributing this way to the attainment of the central management objective. This particular undertaking has been the continuing goal of governmental formations for several decades, without however achieving adequate results. The current conditions that have led to exponential developments in economic/social/political level in Greece could represent an important opportunity to develop an administrative *leap* able to significantly change the image of the public sector. The crisis afflicting the country could become an unprecedented experience of conducting determining administrative changes. A better use of human factors can lead to improved productivity and ultimately to the overall performance improvement of public administration, decisively assisting the country out of the crisis.

The above analysis underlines the fact that the management of the performance of human resources in Greece presents a number of shortcomings. The inadequate administrative system combined with numerous deficiencies of the Greek public administration, such as the bureaucratic and dysfunctional organization, the highly politicized public sector, the lack of effective education and training, the prevailing organizational culture, have led to the current low level performance of civil servants. Nevertheless, the implications of the Memorandum of Understanding between Greece and its creditors, the wider administrative necessity of implementing key reforms, and the imported know-how provided by international and European organizations have created a particularly important window of opportunity through which Greece has the potential to achieve remarkable improvements in its administrative environment. Recently adopted Law No. 4369/2016 on the evaluation of staff reflects this trend by setting out clearly objective performance criteria for the evaluation of the entire public sector. The adoption and implementation of this law is already shaping a different culture in terms of the adoption of effective performance evaluation systems having overcome obstacles that previously seemed insurmountable such as trade union reactions, political pressures, and general resistance of workers. The problem of civil servants performance remains, but it is now clear that important steps are being taken to improve the past shortcomings driving Greece into a course along the lines of the European administrative environment. Improving staff productivity may be the starting point for a radical restructuring of the Greek administrative system, contributing decisively to the country's exit from the economic crisis.

Employees; Human capital management; Manpower; Personnel management; Staff; Workers; Workforce

## Introduction

Following its independence from the Soviet Union in 1991, Kazakhstan embarked on significant reforms toward the development of a market economy (Arystanbekov 2005; Bhuiyan and Amagoh 2011). In similar vein, the country's human resources management (hereafter referred to as HRM) has followed the same trajectory of

transitional development. Kazakhstan is a multicultural society that constitutes an amalgam of inhabitants of more than 120 nationalities. Its national culture is further influenced by its colonial Russian environment and 70 years of Soviet legacy. Kazakhstan has oil and gas reserves which are estimated to be the third largest in the world and ranks among the top 20 countries in terms of oil production (Promfret 2005). Consequently, the oil, gas, mineral, and energy reserves have made Kazakhstan a very attractive prospect for foreign direct investments (FDI), with significant implications for its human resources management practices.

According to Taylor et al. (1996), HRM constitutes a set of distinct activities, functions, and processes that are directed at attracting, developing, maintaining, and harnessing human activities within an organization. HRM can be considered as part of an organization's corporate strategy and is judged by how well it fits with corporate requirements (Brewster and Larsen 2000). Kazakhstan has made significant economic progress since its independence, especially in terms of attracting foreign firms and increasing the number of small businesses. However, the country lags well behind most of the countries it wishes to emulate on key indicators of economic and social well-being (such as life expectancy, perception of corruption, per capita income, gross domestic product, and infant mortality) (Davis 2012). The strategic plan of Kazakhstan's *Ministry of Labor and Social Protection* emphasizes the importance of HRM in achieving national development and innovation targets. This means that the country needs to have human resources (HR) specialists that are versed in various management areas, such as job design, workforce planning, organizational learning, organizational development, etc. The country depends heavily on oil and gas exports, which account for 90% of all outbound goods. Economic diversification is at the center of Kazakhstan's strategic development plans. Thus, the government's aim is to reduce the overdependence on oil and gas revenues and facilitate more effective HRM practices, among others. To this aim, Kazakhstan is cooperating with international organizations, such as the Organisation for Economic Co-operation and Development (OECD), to develop HRM standards for its public sector that would align with international best practices. While the literature on HRM in Kazakhstan is sparse, the limited available information suggests that HRM thinking and practice are underdeveloped, disorganized, and isolated in the country (OECD 2018; Davis and Yugay 2012; Minbaeva et al. 2007).

## Transitional Challenges

Kazakhstan's economic transition to a market economy after its independence was based on price liberalization and privatization of state enterprises (Rysbekov 1995). However, due to the sudden halt of large financial transfers from the former Soviet Union (which the country relied on to finance government expenditures), erratic oil prices, and subsequent government policies, the country was plagued with hyperinflation, negative GDP growth, and large government deficits in the 1990s (Muratbekova-Touron and Umbetalijeva 2018; Wilson et al. 2002). With the country's concerted efforts toward integration into the global community, increasing government regulation of employment practices, the need for skilled and competent human capital, and the influx of FDI, it became imperative to have new HRM practices that aligned with western standards.

While there are still elements of bureaucratic top-down management with authoritarian and centralized decision-making style in many organizations, the role of the HRM department in many companies in Kazakhstan has evolved over time from an administrative backup system (which dealt with paper work) to a managerial unit (which sees people as resources to achieve organizational objectives). However, according to Davis and Yugay (2012) and OECD (2018), there are still some Kazakh-owned companies that tend to have a prescriptive and functional approach to employee management, reminiscent of the Soviet era. This is because strategic HRM and modern employee-management techniques

still remain alien to some indigenous firms where local managers focus on controlling and directing their workers.

After the economic crisis of the 1990s, there was a substantial increase in economic growth and stability, which eventually attracted foreign investments into the economy. The current HRM practices in Kazakhstan consist of an amalgam of old-style Soviet practices meshed with western-based standards. Consequently, there is a convergence of HRM practices of foreign subsidiary organizations with a tendency to maintain employee relations' policies consistent with the influence of old Soviet practices.

After independence, Kazakhstan's labor laws were based on the Soviet labor code, but these laws have continually been revised to meet western and modern-day practices. By the end of the 1990s, the rapid increase in the private sector began to affect HRM practices. The first comprehensive labor law took effect on January 1, 2000, and has been amended on an almost yearly basis. However, the new laws and subsequent amendments are still characterized by excessive bureaucracy and centralization of enforcement powers (Smirnova and Tatibekov 2013; Yessengeldin et al. 2015; Muratbekova-Touron 2002).

## The Role of Informal Networks (Clanism)

Political and social science researchers broadly refer to clanism as an informal social network characterized by an extensive network of kin and fictive kin ties, or perceived and imagined kinship relations (Collins 2006). The influence of formal and informal institutions has implications for the impacts of clans in organization of society (Horak 2016). Formal institutions in transitional economies such as Kazakhstan tend to have less impact than the informal institutions that organize and govern citizens' everyday life (Minbaeva and Muratbekova-Touron 2013). For example, clans were significantly more important than formal institutions in the organization of society in the early phases of Kazakhstan's post-Soviet transitional period. While clans do not determine macro-level outcomes, they shape and constrain the preferences and decisions of individual actors (Hotho et al. 2018). In terms of indigenous practices, Kazakhs are characterized by a strong feeling of identity and loyalty to one's particular sub-ethnic group or clan.

Although a hybrid of formal and informal institutional frameworks shapes strategic choices when formal institutions are weak, informal institutions (such as norms governing interpersonal relationships) tend to play a larger role in shaping individual and group activities (Peng et al. 2008). It is therefore important to understand the powerful role of informal interpersonal social networks, and how they affect management practices in firms operating in such environments, like Kazakhstan where informal social networks seem to have significant impacts. Understanding communities in which managers are embedded and their ties to members of those communities can provide valuable insights into how managers experience social pressures to engage in favoritism and the effects of such pressures on their recruitment and other HR practices (Jones and Stout 2015).

The links within the clan's network can be through blood ties between immediate relatives; marriages; or fictive kin identities, such as schools, universities, friendships, neighborhood affiliations, etc. (Minbaeva and Muratbekova-Touron 2013). Such links can lead to biased HR practices (such as recruitment, hiring, and promotion). Although communities differ in who is considered related, the notion of relatedness implies immutable obligations and trust and can affect how HR managers respond to social expectations of clan members during recruitment and selection processes. Thus, these ties can be classified as either direct or indirect. Direct ties are direct personal relationships among members of a network, while indirect ties are relationships among network members that are mediated by other ties (Bian 1997). The notion of indirect ties highlights the fact that community members are connected to other community members even in the absence of direct ties (Horak 2016). Managers are therefore likely to experience stronger obligations and responsibilities toward community members with whom they have direct ties than toward

community members with whom they have indirect ties.

The influx of subsidiaries of western MNCs has influenced HRM and business practices as well as brought changes to the mind-set of people who have worked in western firms. Once local employees are exposed to the strict company policies of western firms (which frowns on favoritism and nepotism), they find it difficult to work in the public sector and indigenous businesses where such practices still exist. It should be noted that while the scope and scale of HRM in a firm are defined to a great extent by top management, individual HR managers typically determine the types of HRM practices that are actually implemented. This implies that Kazakh managers have the tendency to be affected by clanism in their everyday activities since it is more likely to shape and constrain their beliefs and attitudes, especially in those HRM practices that are more subjective. Furthermore, the lack of effective and efficient formal institutions that are meant to regulate the local labor market compounds the effect of clanism on HRM practices due to unnecessary bureaucracy.

## Major HRM Issues

While the HRM issues that confronted Kazakhstan in the early years of transition include poor health and safety conditions; poor recruitment, selection, and retention processes; etc., as time progressed, the emergence of management and HRM practices from subsidiaries of foreign firms has had significant impacts on how employees are viewed and treated by some local firms. However, even though some HR issues have improved over the years, the following areas (namely, skilled and competent workforce; performance management, compensation, and training; and recruitment) deserve urgent attention.

### Skilled and Competent Workforce

According to Yessengeldin et al. (2015), there is inadequate supply of skilled human capital to meet the labor market in Kazakhstan. This is especially true in specialized and professional fields, such as engineering, professional education, advanced technology, innovation management, etc. Over the years, Kazakhstan has had to employ foreign experts in these key areas to assist in its development and facilitate knowledge transfers to the local population. Developing the skills and competences of the local population is essential for meeting the human capital needs of the *Kazakhstan 2050 Strategy,* which, among other things, aims to make Kazakhstan one of the top 30 economies of the world by 2050. Furthermore, due to the prevalence of the Soviet management style among the older population, many employers are reluctant to recruit workers older than the age of 45 years (Smirnova and Tatibekov 2013). It is widely believed that people in such age group cannot easily adapt to modern technology and western management style. This means that Kazakhstan needs to develop strategies that incorporate the older generation into modern management practices and technological innovations in order to harness the full potential of all its citizens.

### Performance Management, Compensation, and Training

Due to the influx of subsidiaries of western firms, efforts have been made to adapt western performance appraisal procedures to local standards where feasible. The Soviet-era mandatory performance evaluation process (called *attestatsiya* or attestation) was used to assess whether an employee has met the requirements of a position, and not necessarily about the professional development of the worker. While such mandatory evaluations still exist in the public sector, it is rarely practiced in the private sector. It should be noted that even though significant progress has been made, the performance appraisal methods still practiced in the private sector lack adequate focus on employee professional development. Many firms in Kazakhstan have progressively been highlighting the importance for pay for performance using the western performance and compensation schemes that focus on individual incentives and rewards. Some companies use benchmarks to evaluate their workers' performance; however, it is not uncommon to find that the final decision on outstanding employees is made by senior management rather than the HR department. With regard to

the civil service, Kazakhstan is in the process of developing HRM frameworks that are consistent most OECD standards. The country aims to use recruitment and promotion merit-based methods similar to most OECD countries in its public sector (OECD 2018).

Social packages in most firms are negotiable and could be used as a tool to attract and retain competent workers. This is particularly important for workers because the social safety nets that were in place during the Soviet era are no more in place. It is hoped that as western compensation and performance schemes continue to focus on individual incentives and a reward system based on merit, clanism will continue to have less effect on HR practices in Kazakhstan (Minbaeva et al. 2007).

The area of employee training is also crucial in maintaining a skilled and competent workforce. Many companies find it easier and cheaper to temporarily recruit competent expats that would develop the skills of their workers in the areas of western HRM practices. When necessary, some firms send some of their workers abroad to acquire specific skills. There is also a strong emphasis on mentorship as part of employee development, which requires maintaining close personal relationship with someone in a senior position.

### Recruitment

Even though analysts indicate that recruitment campaigns and strategies of Kazakh firms show modest attempts to adapt western practices to the local context, recruiting managers are often viewed as the human conduits of local norms of favoritism due to the clannish culture. According to Hotho et al. (2018), managers' embeddedness in local communities can provide recruitment-related benefits (Horak 2016; Jones and Stout 2015). Similarly, the norms and obligations of such communities exert considerable pressures on recruiting managers to diverge from professional standards and engage in various forms of favoritism (Chen and Miller 2011). Consequently, managers responsible for recruitment processes that involve applicants from their own communities frequently face the challenge of reconciling conflicting sets of social expectations regarding the recruitment process.

In addition, many recruiting managers in Kazakhstan face a conundrum whereby on the one hand, they may experience considerable pressure to share employment opportunities with family members and acquaintances, while on the other hand, they realize that engaging in such practices entails considerable costs which may be detrimental to their careers. As a coping strategy, some recruiting managers tend to decouple their recruitment decisions from the handling of the recruitment process. This allows them to adhere to communal norms and obligations while making decisions that are more aligned with organizational standards and their own career interests (Minbaeva and Muratbekova-Touron 2013).

The development of competency management standards for the civil service is one of the measures needed to enhance performance in Kazakhstan's public sector. Competency-based recruiting implies developing new and effective selection tools and training HR officers and recruiting competent managers that base their decisions on the results. Kazakhstan is in the process of applying such competency frameworks which identify skills and capacities for certain categories of civil servants and provides necessary training to meet required standards (OECD 2018). This also implies the use of competency frameworks as a basis for merit-based recruitment and promotion throughout the system.

## Conclusion

HRM practices in Kazakhstan have evolved since the country gained its independence from the Soviet Union in 1991. Although some indigenous firms are not yet fully aligned with western management practices, a significant number of HR managers with experience in subsidiaries of western firms appreciate the importance of developing and nourishing the potential competences and skills of their employees. It can be said that western management practices have had an impact on HRM in Kazakhstan by reducing the effects of clanism in management operations. This is partly because HR managers who had previously worked in western subsidiaries of multinational

companies in Kazakhstan tend to transfer such knowledge when they move to local firms. Mitigating the impacts of clanism and favoritism in management practices will go a long way in improving HRM in Kazakhstan, especially in areas of recruitment and performance management. Kazakhstan is also in the process of transforming the HRM practices in public sector by developing western best practices in collaboration with OECD. While there are still some challenges and the HRM continue to evolve and improve, it is very likely that HRM development in Kazakhstan may not adapt as rapidly as the development of the country's economy and the government's desire to fulfill its long-term sustainable development strategies (Yessengeldin et al. 2015; Davis 2012).

# Human Rights in Africa

Damian O. Odunze
Texas Southern University, Houston, TX, USA

## Synonyms

Basic rights; Civil liberties; Civil rights; Constitutional rights; Cultural rights; Fundamental freedoms; Peoples' rights; Political rights; Privileges; Rights; Social rights

## Definition

Human rights are the basic rights or individual freedoms one has simply because the person is a human being. They constitute individuals as a particular kind of political subject: free and equal rights-bearing citizens. Human rights declarations outline regulative rules and practices of how governments should treat citizens. They are like a forward-looking moral, economic, cultural, and political vision of a society. Human rights also characterize societies of a particular type by defining the requirements and limits of legitimate government (Rawls 1999; Donnelly 2013). These rights are equal, inalienable, and universal. That means all individuals should enjoy these civil liberties without distinction of any kind such as race/ethnicity, color, gender, language, religion, political, or other opinions.

## Introduction

The history and development of human rights in Africa is within the backdrop of the United Nations organization, the legacy of colonialism, and the contemporary social, economic, political, cultural, and religious quagmires that face the continent. The African Charter on Human and Peoples' Rights (ACHPR 1981), also known as the Banjul Charter, is an international human rights instrument that is intended to promote and protect human rights and basic freedoms in the African continent. In 1979, the Assembly of Heads of State and Government of the Organization of African Unity (OAU), now known as the African Union (AU), sets up a committee to draft a charter on human rights similar to those of the European Union (European Convention on Human Rights) and the Americas (American Convention on Human Rights). The draft was unanimously adopted at a general assembly of the OAU in 1981. After the draft was ratified by a simple majority of the OAU member states, the ACHPR came into effect on October 21, 1986. October 21st was declared "African Human Rights Day."

As of 2013, 53 member states of the AU have ratified the Charter with the exception of the newly created nation of South Sudan.

The African Commission on Human and Peoples' Rights established in 1987 monitors the Charter to ensure that member states abide by its provision. The African Court on Human and Peoples' Rights set up in 2004 complements and reinforces the functions of the ACHPR. The Court has jurisdiction over all cases and disputes submitted to it concerning the interpretation and application of the ACHPR and any other relevant human rights instrument ratified by the countries concerned. Specifically, the Court has two types of jurisdiction: contentious and advisory. The ACHPR followed the footsteps of the Universal Declaration of Human Rights (UDHR) by the United Nations organization in 1948. The UDHR became a standard of human rights achievement for all nations. The Declaration, which arose directly from the experience of the Second World War, consists of thirty articles. The UDHR (Resolution 217A) represented the first global expression of the rights to which all human beings are inherently entitled and to be guaranteed universal protection. The UDHR (Article 1) succinctly states that all human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act toward one another in a spirit of brotherhood. The ratification of the International Bill of Human Rights in 1976 gave international legal backing to the UDHR. These universal declarations of human rights are a veritable Magna Carta (Charter of Liberties) to nations and societies that are still grappling with the awareness of human dignity and worth.

## The Norms of the African Commission on Human and Peoples' Rights (ACHPR)

The ACHPR constitutes 68 articles that aim to further the goal of the Organization of African Unity, which stipulates that freedom, equality, justice, and dignity are essential objectives for the achievement of the legitimate aspirations of the African peoples. The preamble of the ACHPR

further reaffirmed the purpose of the Charter to eradicate all forms of colonialism and neocolonialism from Africa, to coordinate and intensify efforts to achieve a better life for the peoples of Africa, and to promote international cooperation having due regard to the Charter of the United Nations and the Universal Declaration of Human Rights. The ACHPR also recognizes the right of citizens to economic, social, cultural, and political development. Furthermore, it envisions the elimination of all forms of discrimination, particularly those based on race, ethnic group, color, sex, language, religion or political opinions, national and social origin, fortune, birth, or other status (Article 2). These cover rights to individuals and peoples, but also include duties incumbent upon them.

The civil and political rights of individuals are covered in Articles 2–14 and 18(3). These include the right to freedom from discrimination, equality before the law, life and personal integrity, human dignity, freedom from slavery, freedom from cruel, inhuman or degrading treatment or punishment, right to due process concerning arrest and detention, the right to a fair trial, freedom of religion, freedom of information and expression, freedom of association, freedom of assembly, freedom of movement, freedom to political participation, and the right to property.

The Charter also outlines some economic, social, and cultural rights. Considerable emphasis is placed on these rights: the right to life (Article 4), the right to work (Article 15), the right to health (Article 16), the right to education (Article 17), and the right to development (Article 22).

Additionally, the Charter recognizes group or peoples' rights (Articles 18–25). The group rights include the protection of the family by the state, equality of all groups, the right to self-determination, the right to freely dispose of collective wealth and natural resources, the right to development, the right to peace and security and a generally peaceful environment, and the independence of the judiciary. Duties of individuals toward the family and society (state) are mentioned in Articles 27–29 of the Charter.

## The Human Rights Framework

To resist oppression is at the very core of the concept of human rights. Human rights explicitly address power imbalances and raise the question of the legitimacy of the powerful (UDHR 1948). So, at the background of human rights is the issue of power or public governance and accountability. Good governance refers to how public institutions conduct public affairs and manage public resources. It involves the manner in which power is exercised in the management of a country's economic and social resources for development (The World Bank 1991). This raises the issue of the transparency of institutions of authority in a country. The Worldwide Governance Indicators project defines governance as the set of traditions and institutions by which authority in a country is exercised (The World Bank 2006). The political, economic, and institutional dimensions of governance are captured by six aggregate indicators. The first indicator is the degree to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media. Second are political stability and the absence of violence, including terrorism. The third indicator is the effectiveness of government as measured by the quality of public services, the quality of the civil service and the degree of its independence from political pressures, and the quality of policy formulation and implementation of such policies by the government. The fourth indicator is the ability of the government to implement sound policies and regulations that permit and promote private sector development. Fifth is the implementation of the rule of law, including the extent to which all citizens have confidence in and abide by the rules of society and in particular the quality of contract enforcement, the police, and the courts, as well as the likelihood of crime and violence. The sixth indicator is the extent of control of corruption. Is power exercised for private gain, including both petty and grand forms of fraud? Do the elite and private interests "capture" the state for personal aggrandizement? The Worldwide Governance Indicators make it possible to evaluate the quality of a country's

governance in comparison with other countries – and over time. The absences of some of these governance indicators are predictive of human rights abuse in a society or country.

## Human Rights Abuse in Africa

The bottom line of most theoretical explanations of human rights abuse in Africa is bad governance, and subsequently, the promotion of good governance, democracy, the rule of law, and accountability enhances civil liberties and human flourishing (development). An examination of most African countries would reveal that only a few would pass the "litmus test" of transparency and accountability in governance and in upholding the tenets of the African Charter on Human and Peoples' Rights. Some of these human rights dilemmas are rooted in the legacy of colonialism, while others are as a result of the failure of the African elite, namely, the socioeconomic and political leaders.

The modern states in Africa were the results of colonialism and imperialism, processes that marginally integrated African states into the global political economy in the interests of the colonizing nations. The African societies, for decades, were suppliers of cheap raw materials and human labor for the industrial production in the colonial nations and their satellite territories. Decolonization and political independence entailed the transfer of political power to the political elite that cloaked themselves in colonial practices, philosophies, structures, and interests. Consequently, the protection of their group interests, which implied maintaining the colonial mentality and ethos, sets into motion the era of neocolonialism. The emergent ruling class had little or no impetus toward altering the marginalized position of African states in the global politico-economic system. Most of these emergent African leaders became pawns in the hands of former colonial rulers and multinational corporations. Corruption and abuse of human rights were rampant. The pursuit of economic development was basically sidelined in many countries. The resources of the state were used to keep the elite in power. This also marked the era of military dictatorship, as the armed forces that seized power to "correct" the errors of civilian governments turned out worse. The Cold War superpower politics compounded the African quagmire, since the superpowers, the United States, and the former Soviet Union and their allies supported African rulers, irrespective of their governing qualities and records of human rights abuse. Dictators received millions of dollars in foreign aid to ensure their allegiance to the superpowers. There was hardly any demand for public accountability as millions of dollars were squandered or looted and stashed away in foreign bank accounts. African dictators, such as late emperors Jean-Bédel Bokassa of Central African Republic, Idi Amin Dada of Uganda, and Mobutu Sese Seko of Zaire, now Democratic Republic of the Congo (DRC), lived in palaces and wasted public funds, while majority of the citizens remained in penury. Thousands of innocent civilians were persecuted, tortured, and/or killed just for speaking out against injustice. For instance, Bokassa, during his coronation as self-proclaimed emperor in 1977, spent US $20 million ($80 million today), virtually bankrupting the country. His diamond-coated crown alone costs $five million ($20 million today). In 1979, his Imperial Guard massacred 100 schoolchildren who were arrested for refusing to buy uniforms from a company owned by one of his wives. Mobutu, who came to power in a coup d'état in 1965, established a one party-centralized state in which all power was concentrated in his hands. He amassed large personal fortune through corruption such that some scholars have dubbed his regime a kleptocracy or rule by a thief (Acemoglu et al. 2004). As a result, the country suffered from uncontrolled inflation, a huge debt, and massive currency devaluations. Idi Amin's 8-year reign goes down as one of the worst regimes in Africa, comparable in scale to that of Pol Pot, the brutal Khmer Rouge leader and Cambodian dictator. Amin's rule was characterized by human rights abuses, political repression, ethnic persecution/cleansing, extrajudicial killings, nepotism, corruption, and gross economic mismanagement. It is estimated that between 100,000 and 500,000 people were killed during

his regime (Ullman 1978). Among the most prominent people killed were Benedicto Kiwanuka, a former prime minister and chief justice; Janani Luwum, an Anglican archbishop; Joseph Mubiru, the former governor of the central bank of Uganda; Frank Kalimuzo, the vice chancellor of Makerere University; Byron Kawadwa, a prominent playwright; and two of Amin's own cabinet ministers, Erinayo Wilson Oryema and Charles Oboth Ofumbi. Ironically, when Milton Obote, the former prime minister, who was toppled by Idi Amin, came back to power in 1981, he unleashed another reign of terror against perceived supporters of Idi Amin. An Amnesty International report estimated that over 500,000 people were killed under Obote's rule from 1981 to 1985 (Amnesty International 1985). These incidents are only a snapshot, and there were other dictators like the late Sani Abacha of Nigeria, Macias Nguema of Equatorial Guinea, Siad Barre of Somalia, Charles Taylor of Liberia, and Hissène Habré of Chad who not only looted the public treasury of their countries but also brutalized and killed tens of thousands of citizens. In 2012, the Special Court for Sierra Leone (SCSL) tried and convicted Charles Taylor on 11 charges arising from war crimes, crimes against humanity, and other serious violations of international humanitarian law, committed from November 30, 1996 to January 18, 2002 during the course of Sierra Leone's civil war. He was subsequently sentenced to 50 years in jail. Another milestone for justice in Africa occurred in 2015 when the former Chadian dictator, Hissène Habré, went on trial on charges of crimes against humanity, war crimes, and torture before the Extraordinary African Chambers in the Senegalese courts. The advent of the trial, 25 years after Habré was overthrown and fled to Senegal, is entirely due to the perseverance and tenacity of Habré's victims and their allies such as Human Rights Watch. In May 2016, Habré was sentenced to life in prison for being responsible for the death of 40,000 Chadians during his rule. Again, in 2014, 20 years after the Hutu (Rwandan) genocide against the Tutsi, a significant number of perpetrators of the genocide, including former high-level government officials and other key figures behind the massacres, have been brought to justice. The majority have been tried in Rwandan courts. Others have gone before the International Criminal Tribunal for Rwanda (ICTR) or domestic courts in Europe and North America. These trials of African leaders who abuse the basic liberties of their citizens should serve as a signal to other authoritarian leaders that the arm of justice will catch up with them someday.

Today, the African continent has the worst record of sit-tight leaders who repress the fundamental rights of citizens. These rulers refuse to relinquish power contrary to the will of the people by rigging elections, making false promises, and imprisoning and even killing opponents and critics. They make politics a violent zero-sum game and sow the seeds of discord among the various ethnic and religious groups (Akude 2007). Most of these countries are ridden with ethnic, religious, and political violence. President Barack Obama told an African Union Summit in Addis Ababa, Ethiopia, in July 2015, that a leader, who tries to change the rules in the middle of the game just to stay in office, risks instability and strife. Furthermore, a leader who claims to be the only person who can hold a nation together has failed to build a nation. Fifteen leaders of the 48 African countries that hold regular elections have served more than two terms or indicated their intention to do so. The presidents of Equatorial Guinea, Angola, Cameroon, and Uganda have ruled for over 30 years; and those of Zimbabwe, Sudan, Chad, and Eritrea have been in office for over 20 years, including the former dictator of Burkina Faso (Blaise Compaoré) who ruled for 29 years. The leaders of Rwanda, Algeria, Djibouti, Congo Brazzaville, and DRC have been in power for over 15 years. Many entrenched African leaders have a poor record of combating corruption and fostering development and human rights. For instance, according to the Transparency International's (2015) Corruption Perception Index, out of 168 countries, Somalia ranked 167th, Sudan 165th, Angola and South Sudan 163rd, Libya 161st, Zimbabwe and Burundi 150th, and Uganda 139th. Rwanda was the exception, ranking 44th. Five of the ten most corrupt countries also rank among the ten least peaceful places in the world. After Iraq and Afghanistan, the next five are African countries: South Sudan,

Central African Republic, Somalia, Sudan, and DRC. Africa's so-called strong or big men entrench themselves at the expense of their country. Leaders who personalize power often have bad human rights records and during elections use repression to keep power in the hands of a few. Resistance to the legacy of these "strong men" often results to anomie or normlessness, a condition of total breakdown of societal standards and values.

The effects of corruption (the abuse of public office for private gain), neglect of economic development, and politicization of ethnicity and religion have also contributed in destroying the social fabric of many African countries. For example, Nigeria, which is the most populous African nation and the largest economy in Africa, today ranks third in the Global Terrorism Index (after Iraq and Afghanistan). The Boko Haram insurgency in the northeastern part of Nigeria has so far claimed over 17,000 lives according to the African program on the US Council on Foreign Relations. In addition, more than 1000 schools have been destroyed and over one million children deprived of education. Millions have been rendered homeless and live as refugees both within and outside of Nigeria. The jihadist terrorist group, Boko Haram, is notorious for its use of children as suicide bombers and kidnapping and raping of women and young girls and destruction of property. The Nigerian security forces have been noted for extorting money from people who were falsely accused of supporting Boko Haram. The Nigerian military has also committed extrajudicial killings of suspected members of insurgent groups such as Boko Haram, the Niger Delta militants, and members of the Shiite Islamic Movement in Nigeria (IMN). The Niger Delta militant group is campaigning against the environmental degradation of the Niger Delta region that supplies over 90% of Nigeria's crude oil, which is the main income earner for the country. According to Amnesty International, between 2012 and 2014, the military executed at least 1200 men and boys suspected of belonging to Boko Haram and buried them in mass graves. Another 7000 died in custody through torture, starvation, and lack of medical care. In December 2015, over 350 Shiites were unlawfully killed by the military during clashes and buried in a mass grave. The leader of the IMN, Sheikh Ibrahim Zakzaky, was brutalized during his arrest. The use of excessive force to silence people's right to express their opinions and engage in peaceful demonstration has forced some groups to resort to extreme measures and become violent. For instance, Boko Haram in Nigeria did not start as a violent group. It began in 2001 as a purely Islamic sect and tried to fill the gap created by years of economic neglect by the government that led to massive poverty and unemployment. The group provided social services to people. It was when the founder, Mohammed Yusuf, was killed in police custody in 2009 that the group took a more violent and retaliatory approach by declaring war against the Nigerian government. What is happening in Nigeria is also similar to other flash points of insurgency in Africa such as Somalia, DRC, Sudan, South Sudan, and Cameroon. Most often it is the years of neglect and economic deprivation caused by the government that creates a fertile ground for militant and extremist groups to thrive. Furthermore, the fact that most of the perpetrators of human rights abuse are protected by the government and are not prosecuted fuels the urge to revenge on the part of the victims.

## Analysis and Conclusion

African countries made giant strides in the 1990s, when Zambia had its first democratic change of government, Mozambique's civil war ended and South Africa agreed on a peaceful end to apartheid. The Zairean dictator, Mobutu Sese Seko, was toppled as president of what is now the DRC, and Ghana and Nigeria reverted to democracy. Since then many African countries have continued on the path of democratic governance although with instances of election malpractices and violence. Women have also become key political players in some countries in Africa. In 1993, Sylvie Kinigi became the first female prime minister of Burundi and the first woman to be an acting president. What makes her so important is that she rose to power during the Burundi Civil War and created a temporary government to hold the nation together in the midst of chaos. Kinigi

stayed in office from July 10, 1993 to Feb. 7, 1994. Ivy Matsepe-Casaburri served as acting president of South Africa in 2005. Rose Francine Rogombé was the acting president of Gabon from June to October, 2009. Joyce Hilda Banda was the first female vice president and president of Malawi. In 2011, she founded the People's Party. From April 2012 to May 2014, she served as president when her predecessor, Bingu wa Mutharika, died in office. In 2014, Catherine Samba-Panza was appointed the first female interim president of the Central African Republic by the Nation's Transitional Council. Agnès Monique Ohsan Bellepeau served as acting president of Mauritius twice in 2012 and 2015. She became president when Anerood Jugnauth and Kailash Purryag resigned after internal political strife. In 2006, Ellen Johnson Sirleaf was elected president of Liberia. She is one of the most stable leaders in Africa, holding political office for almost 10 years without interruption. In 2011, she was awarded the Nobel Peace Prize. Furthermore, in the Inter-Parliamentary Union data (2016) of women in national parliaments, out of 191 countries, Rwanda ranks first with 51 women out of 80 or 63.3% in the lower house and 10 out of 26 or 38.5% in the upper house (Senate); Senegal comes sixth with 64 women out of 150 or 42.7% in the lower house; South Africa comes eighth with 168 women out of 399 or 42.4% in the lower house and 43 women out of 128 or 33.6% in the upper house. Other African countries with more than 35% of women in the lower house are Namibia (ranked 11th), Mozambique (ranked 15th), Ethiopia (ranked 19th), Angola (ranked 23rd), Burundi (ranked 27th), and Uganda (ranked 29th). The participation of women in public governance in Africa is a positive development as they can help bring stability in government. Moreover, women and children are mostly affected during social, political, religious, or economic crises. They are the most vulnerable during periods of uncertainty in any nation. So, it is good that women are gradually becoming part of the transformation of the sociopolitical and economic landscape of Africa.

Fair and transparent democratic elections and accountability by elected officials are the foundations that sustain human rights and the rule law in any society. The embezzlement of public funds by elected officials who divert resources meant for development into private coffers is a precursor for disenchantment by the people who are denied basic amenities. In many African countries, economic inequities and lack of opportunities are the sources of ethnic, social, and political violence as the people struggle for scarce resources. Instability and abuse of civil liberties puts Africa in a weak position in the global race for economic and human development. There can be no sustained development without a peaceful coexistence of citizens. As the world has become a "global village," through modern technology and international business, global interdependence is associated with peace and peace with democracy and stable institutions (Ibrahim 2013). One major positive impact of globalization on Africa is that it has made available information on how other countries are governed and the freedoms or civil rights in those countries. It has also opened African countries to intense external scrutiny and exercised pressure for greater transparency, openness, and accountability. Digital streaming of news and information is now instantaneous through social media outlets such as Facebook, Twitter, Instagram, and LinkedIn and private video broadcast on YouTube and cell phones. The world is now connected through the Internet; and what happens in one country affects other countries. As people interact and conduct business online, boundaries are blurred and information and ideas are exchanged. This free flow of information can also have a negative impact, as has been seen with the case of global terrorism, where extremist jihadist groups spread their ideologies online targeting vulnerable people. This is also a big security challenge to African countries. Globalization also entails free flow of goods and services between nations. This can have both favorable and negative consequences. It can help countries to acquire new technology and competency in areas where they lack technical know-how. On the contrary, many African countries have become dumping grounds for cheap foreign products. This has destroyed local industries leading to massive unemployment. Many instances abound. In Nigeria, for example, local textile industries, which hitherto employed thousands

of people, have become almost extinct due to cheap products from China. The same holds true for agricultural products such as rice, which has seen the domination of important brands and made local production unprofitable. In the 1980s and 1990s, the International Monetary Fund (IMF) pressured the Ghanaian government to remove support and protection for poor rice farmers. Liberalized rice imports from foreign countries, especially the United States, led to dumping practices that contributed to the displacement of domestic rice and to the loss of income of rice peasants in Ghana (Suarez 2013). African countries should protect the rights of local industries from undue advantages of foreign products and multinational companies. Medium- and small-scale local enterprises contribute enormously to job creation and economic growth.

Finally, international and regional human and peoples' rights framework allow us to question and challenge human rights abuse and unfair policies including international trade and business. It also serves as a deterrent to those who would flout human rights or laws protecting civil liberties knowing that they would be held accountable for their actions. Africa has abundant human and material resources to usher in economic development. However, good governance, respect for civil rights, and democracy are fundamental imperatives for stability, which is essential for human flourishing. Governments and business enterprises have a responsibility to ensure that their policies and actions have a positive effect on the society. Everyone is better-off when civil liberties are guaranteed and protected. Human rights issues should become part of the public discourse and educational curriculum in every African nation.

# Human Rights in the Twenty-First Century

Franke Wilmer
Department of Political Science, Montana State University, Bozeman, MT, USA

## Introduction

Understanding politics as the "authoritative allocation of values," as David Easton suggests, puts human rights at the center of twenty-first-century

world politics. As a set of values, human rights are predicated on the idea that human beings, people, are the central subjects of politics and certain rights inhere in them because they are human. Depriving human beings of these inherent rights diminishes and offends their humanity. The offending agent is non-specific; it could be a governmental authority or a private, non-governmental, or non-state actor. The concept of human rights as inherent focuses on the humanity of the individual, not on the inhumanity of the offender, although by extension, if depriving an individual of these rights constitutes an offense against their humanity, it is an act of inhumanity. Furthermore, humanity is indivisible, and as such, an offense against the humanity of anyone is an offense against everyone.

Although many, if not all, cultures and religious traditions have a concept of human dignity and a human moral order, the specific idea that some injuries and deprivations brought about by human agency constitute offenses to all of humanity is a relatively recent phenomenon. Indeed, assertions of universality or even cultural transcendence are the subject of intense debate among human rights scholars and activists alike (Panikkar and Sharma 2007; A'Naem 2002). Who decides whether any particular value or right is universal? Can any value be taken out of its cultural context? It is easy to say that all cultures have a right to exist, that is, that human beings have a right to exist within a culture and, actually, they do not exist apart from them. However, what are the merits of arguing against cultural imperialism, in favor of cultural immunity from the assertion of universalized norms? These are some of the issues arising from the debate between universalism and cultural relativism.

The question of why universal human rights *now* could be the subject of a lengthy essay in itself. Here, it will only be noted that it is partly so as a consequence of unprecedented possibilities for human physical, social, political, economic, and intellectual contact and interaction, and from that has arisen the assertion that some human-caused suffering is universally offensive. Similarly, the inception and spread of philosophical ideas over the past several centuries have included not only the idea of universally offensive suffering but of inalienable rights and truths that are by virtue of the human capacity to reason, self-evident, arguments central to the natural law view of human rights. While it is true that all of these ideas are intimately linked to European experiences and traditions, it can also be argued that the modern state is also a product of European history and that contemporary human rights are a response to the abuses and excesses of state power.

The benchmark by which all other mass human rights violations are measured is the Holocaust. The term "genocide" was originated by Polish Jewish lawyer Raphael Lemkin in an effort to name what had been called "race murder" when perpetrated by the government of the Ottoman Empire against Armenians beginning in 1915. Of the two million Armenians living in the empire at the time, only 500,000 were left by the early 1920s. Both in scale and depravity, the Holocaust eclipsed all twentieth-century genocides, killing not only six million European Jews but also five million non-Jews including three million Polish Christians. Since World War II, genocides have occurred in Cambodia, former Yugoslavia, and Rwanda. Though not recognized as an international crime at the time of the Nuremberg trials, individuals have been convicted and sentenced for acts of genocide in both former Yugoslavia and Rwanda.

Genocide is very specifically defined in the Convention on the Prevention and Punishment of the Crime of Genocide as any act, "whether committed in time of peace or in time of war. . .," with "intent to destroy, in whole or in part, a national, ethnical, racial or religious group." Two important points here are (1) that although the convention was drafted and signed by states, nothing in the convention specifies that acts of genocide must be committed by agents of states, and (2) although the success of a genocide is irrelevant, it is the *intent* to destroy a group as a group that makes the act an act of genocide. Additionally, the acts listed in the convention are not exhaustive, and the convention includes not only acts of genocide but conspiracy, incitement, attempts, and complicity in committing genocide an international crime. Finally, parties undertake an obligation not only to punish but also to

prevent the crime of genocide, although thus far the record shows success only in efforts to punish.

Because international law is a set of obligations states willingly place on themselves – law by states and for states (not people) – it is safe to say that the contracting parties presumed that state actors would be the subject of both the restrictions and punishment. Today, however, violations of human rights and other violations of international law that states have applied to themselves are often committed by non-state actors, creating a new set of problems for policy makers. Violators may be ethnic groups or private militias, as in Bosnia or Darfur; they may be corporations knowingly contaminating groundwater or through negligence causing deadly catastrophes such as Union Carbide in Bhopal, India; or they may be terror groups competing for political power or establishing territorial control like the Taliban or ISIL. The complicated role of states as violators and enforcers will be discussed more thoroughly in the next section, but suffice it to say here that states agreeing to accept limits on their own conduct, or obligations to intervene in the conduct of other states, is only part of the story of human rights today.

Although some 18 international agreements and protocols cover core human rights issues (United Nations 2016) including the rights of women, children, the disabled, and migrant workers and prohibitions against torture, the death penalty, and racial discrimination, three documents make up "The International Bill of Rights." Those three are the Universal Declaration of Human Rights (1945), the International Covenant on Civil and Political Rights or ICCPR, and the International Covenant on Economic, Social and Cultural Rights or ICESCR. There are 168 states that signed the ICCPR and 164 have signed the ICESCR. The rights enumerated in the non-binding UN Declaration were elaborated in the two legally binding covenants, the split a reflection of the growing US-Soviet ideological chasm as the cold war reshaped the landscape of world politics. Some rights, freedom from torture and unlawful arrest and detention, for example, are litigious, while others, like the right to fair wages, social security, and social insurance, are "aspirational," that is, governments aspire to attain those goals.

The Covenant on Civil and Political Rights includes a national security "opt-out" condition, though it was no doubt intended to be invoked as exceptional and temporary. Article 4, paragraph 1, of the Covenant on Civil and Political Rights allows derogation of treaty obligations in these terms:

> In time of public emergency which threatens the life of the nation and the existence of which is officially proclaimed, the States Parties to the present Covenant may take measures derogating from their obligations under the present Covenant to the extent strictly required by the exigencies of the situation, provided that such measures are not inconsistent with their other obligations under international law and do not involve discrimination solely on the ground of race, colour, sex, language, religion or social origin.

Similarly, the obligations created by the Covenant on Economic, Social and Cultural Rights are commensurate with the capacity of a particular state to meet those obligations within the constraints of both the national economy and reserving the right of the state to exclude nonnationals:

> Developing countries, with due regard to human rights and their national economy, may determine to what extent they would guarantee the economic rights recognized in the present Covenant to nonnationals. (Part II, Article 2, paragraph 3)

The unwillingness of states to intervene in ongoing genocides (or other mass atrocities), the uncertainty about how to address (and perhaps also an unwillingness to act in the face of) human rights violations committed by non-state actors, and the conditionality of rights on national security and state capacity point to the weakness of contemporary international human rights protection. These issues also reveal the fundamental tension between politics and the rule of law – that law is a function of norms agreed to by those with both an interest in making norms and the capacity to enforce them under the rule of law.

## Human Rights and the State: Perpetrator or Protector?

The contemporary state is a set of institutions exercising jurisdiction over people, territory, and resources on the basis of recognition by other

states or, more specifically, by those in positions of authority to act on behalf of state institutions. The state is regarded as possessing the attribute of sovereignty under international law, but it should be kept in mind that sovereignty is a socially constituted norm, or normative belief, about the authoritative exercise of power. In practice, this means that states are accountable to no other authority for almost everything they do unless they explicitly agree to restraints by signing and ratifying treaties and conventions containing legal obligations. Even then, states can withdraw from those obligations by giving notice of that intent as prescribed by the agreement. The one exception today is the prohibition against state-sponsored genocide. The anti-genocide norm is now so widely accepted that states are effectively prohibited from committing genocide or acts of genocide regardless of whether they have acceded to the Genocide Convention (Bassiouni 1996; Czapliński 2006).

As long as the norm of state sovereignty overrides the political will to act to prevent, stop, or punish most or all other human rights violations, states (those acting authoritatively on their behalf) are free to engage in, tolerate, or actively promote activities that constitute violations of rights outlined in the two Covenants and other international human rights agreements. Arguably, the assertion of human rights is itself a fundamental challenge to unrestricted state sovereignty. It is an assertion grounded in a normative claim that places human dignity at the center of any process aimed at legitimating the authoritative use of power and, in that sense, has its roots in the concept of natural law. Political institutions serve people, not themselves.

This raises the issue of the relationship between democracy or democratization and human rights. Rather than spilling more ink here on what constitutes democratic practice, it is more useful to talk about the accountability of institutions to the people they serve. Advocating respect for human rights is advocating for political, social, and economic justice and cultural respect, notwithstanding debates about cultural relativism. It seems straightforward to argue that governing institutions *ought* to serve the needs, protect the freedom, and promote legal, social, and economic justice, but how can they be held accountable for doing so, particularly at the international level where the overarching norm of state sovereignty still trumps efforts to democratize political institutions? And not only are states that lack a history of democratization implicated here, but "older" democracies also claim exceptionalism to their own constitutional restrictions on the grounds of threats to "national security" (Wilmer 2015).

The problem of states in the dual and conflicting roles of perpetrators and protectors of human rights engages the question of self-enforcing norms and the socially constructed nature of law, which is "how is authority constituted?" Obedience to the law is either perceived to be a moral obligation, an act of self-interest, or a necessity of avoiding punishment. It should be noted that self-interest can be immediate or can be an effect of socialization, that is, that there is a broader interest in being perceived by other states as a "cooperator," which, in turn, can deliver future rewards through diplomacy.

As perpetrators, states engage in mass and gross violations of human rights including acts of genocide, arbitrary detention, torture, extrajudicial executions, denial of political rights including voting, and policies that effectively deprive people of access to basic needs for material security and a dignified existence. They tolerate or fail to enforce prohibitions against discrimination, dowry violence, and genital cutting, and they enforce criminal prohibitions against homosexuality including prison sentences and capital punishment.

Norm compliance arising out of moral obligation or self-interest is self-enforcing and in a sense reflects international democratization (in relations among states). Some argue that there is a growing sense of moral community at the international level and that from this arises compliance with international norms motivated by moral obligation (Walzer 1977). The English School conceives of international relations as an emerging world society in which some people and states sometimes act out of moral obligation and sometimes because they are socialized to view norm compliance as a social good (Dunne 2013). States are

protectors of human rights internally when they incorporate international rights obligations into their domestic legal systems or when their domestic legal systems already included those rights, obligations, and protections. They are also protectors of human rights when they engage in enforcement of human rights norms and through humanitarian interventions.

Justification for both enforcement and intervention implicitly supports a restricted view of state sovereignty. Some things that states do, or allow to happen, offend international humanitarian and human rights norms, so the argument goes, and those offenses are legitimately the subject of accusations, trials, punishments, and interventions in the internal affairs of the offending state. Holzgrefe defines humanitarian intervention as:

> the threat or use of force across state borders by a state (or group of states) aimed at preventing or ending widespread and grave violations of the fundamental human rights or individuals other than its own citizens, without the permission of the state within whose territory force is applied. (Holzgrefe 2003: 18)

Abiew (1999), Hilpold (2002), and Chesterman (2011) identify 17 cases frequently cited as humanitarian interventions, with the Russian, British, and French intervention against the Ottomans in the Greek War of Independence in 1824 being the earliest and the 19-state coalition intervention in Libya in 2011 the most recent. Some view this as an example of the policy adopted by the UN in 2005 known as the "Responsibility to Protect" or "R2P." The R2P international security doctrine holds that (1) states carry the primary responsibility for protecting people from genocide, war crimes, and crimes against humanity; (2) the international community has a responsibility to assist in these efforts; and (3) the international community should see peaceful means of fulfilling this responsibility while being prepared for the collective use of force when peaceful diplomacy fails. The International Commission on Intervention and State Sovereignty, formed at the request of then UN Secretary-General Kofi Annan in December 2001, first outlined the doctrine in a report.

Finally, while there is little evidence of success in preventing actual genocides, since World War II, the international community has created two ad hoc and one permanent standing international criminal court with the authority to prosecute and punish those charged with committing acts of genocide, war crimes, and crimes against humanity. The International Criminal Tribunal for the Former Yugoslavia has indicted 161 people, sentenced 80, transferred 13 to other national jurisdiction, and acquitted 18 who are carrying out sentences in 14 states and has 50 cases either terminated, withdrawn, or ongoing (ICTY 2016). The International Criminal Tribunal for Rwanda was the first court in history to convict and hand down sentences for genocide. It has indicted 93 people and sentenced 61. Only 14 individuals have been acquitted with 10 referred to national courts. In addition to government and military officials at the highest ranks, the ICTR has indicted businessmen, religious leaders, and media leaders (ICTR 2016).

One hundred twenty-three states are members of the International Criminal Court. In its 2015 report to the UN, the court listed ten situations where preliminary investigations had begun: Afghanistan, the Central African Republic, Colombia, Georgia, Guinea, Honduras, Iraq, Nigeria, Ukraine, and the State of Palestine (UNGA 2015). In addition to these ten new situations, the court reported 21 ongoing investigations and monitored 8 additional situations from the previous year and issued 12 new warrants. Four trials involving over 10,000 were scheduled for 2016 (ICC 2016).

## The Future of Human Rights

Like the half full, half empty, or refillable glass, there are more or less optimistic and pessimistic ways to view the present status and future prospects for human rights. From the broadest historical perspective, some progress is evident – there is more support generally for democratic norms of self-government, including accountability, fundamental freedoms, civil liberties, civil rights, the rule of law, and social and economic justice.

However, some associate the diffusion of these norms with the extension of western hegemony in non-western societies. Consequently, many non-western societies, like China, India, or Iran, are struggling with the issue of how to square the maintenance of cultural integrity and political independence with the incorporation of democratic norms – and economic liberalism – into their political and economic practices. Others find identity and internal cultural cohesiveness not only elusive but highly and often violently contested, creating an environment in which both repressive governance and public and private actions that violate human dignity and human rights flourish.

Human rights are at risk today not in only non-western societies, however, as the globalization of security threats in a world of porous borders and liberal multicultural states raises new questions about old freedoms as well as relatively new civil rights. These threats can be characterized generally as "terrorist acts" because they target civilians, have a primarily political purpose, seek to instill fear more widely, and are aimed at influencing the behavior of governments as the "third party audience" for whom the act is performed. Surveillance threatens rights of privacy and due process; fear fuels exclusionary nationalist and reactionary policies in previously open societies; "national security" exceptionalism undermines anti-torture and anti-arbitrary detention norms. There is no guarantee that liberal democracies will remain so or that fundamental demands for political freedom and economic justice will prevail in contests with repressive and authoritarian governments.

Repression, however, may be a path for some to obtain and maintain power in the short run, but it is not a path to prosperity. Governments that become more repressive in the face of the fear arising from increasing uncertainty that is the terrorists' greatest weapon must either maintain repression as a new normal or find other ways to reduce the threat. The experiences of Northern Ireland and Israel are instructive. Increasing reliance on repression as a substitute for democratization also does not seem to be sustainable, though it can be long-lived. The cases of Cuba and North Korea come to mind here.

There is, on the other hand, evidence of progress at the international level, though many lament the failure of the international community to mobilize the political will needed to act consistently and successfully on the "R2P" doctrine. The work of several criminal courts, however, can be counted as progress in the direction of norm enforcement at least in relation to acts of genocide, war crimes, and crimes against humanity. Unlike Nuremberg, the Yugoslav Tribunal was created long before the wars in former Yugoslavia ended and even before an end was in sight. With 123 member states of the International Criminal Court, there are, in theory, fewer safe havens for deposed government officials accused of war crimes and crimes against humanity, but member states have not demonstrated a serious commitment to act on their obligations to enforce arrest warrants, as the case of Sudan's indicted President Omar al-Bashir shows. For human rights activists and those on whose behalf they act and advocate, the failure to intervene in ongoing human-caused humanitarian crises overshadows progress measured by the arrest and conviction of a relatively small number of war criminals associated with high-profile genocides.

Finally, as Henry Shue argues, deprivation of access to clean water and adequate nutrition is just as deadly as the direct violence of extrajudicial torture and executions. Over 3 million children die each year from poor nutrition, and 900 die each day from dirty water and poor sanitation (World Food Programme 2016, Water Aid 2016). Over 650 million people lacked access to clean water in 2015 (Water Aid 2016). But here there are also reasons to claim progress. Many of the UN Millennium Development Goals for 2015, set in 2000 by the 189 member states of the UN at the time, have been achieved, although 650 million people are still without clean water, that is, about one-third the number in 2005 (Wilmer 2015). In its 2015 Report on the Millennium Development Goals, the UN Development Programme also reported a reduction by half of the proportion of undernourished people in developing countries, a 45% reduction in maternal mortality, a 40% reduction in new HIV infections and an increase in antiretroviral treatment of HIV-positive people from 800,000 in 2003 to 13.6 million in 2014, and

an increase of 2.1 billion people with access to improved sanitation. Progress is possible, though not inevitable.

# Human Rights Organizations

Wai-man Lam[1] and Andy Wai-fung Yip[2]
[1]School of Arts and Social Sciences, Open University of Hong Kong, Hong Kong, China
[2]Project Citizens Foundation, Hong Kong, China

## Synonyms

First World human rights organizations; Generations of human rights; Third World human rights organizations

## Definition

Human rights organization, according to Wiseberg (1991), is broadly defined as "a private organization which devotes significant resources to the promotion and protection of human rights, which is independent of both governmental and political groups that seek direct political power, and which itself does not seek such power." It advocates its cause on the basis of international laws and aims to secure the rights for everyone in a society (Wiseberg 1992: 529).

Broadly speaking, organizations that advocate or promote interests under the four generations of rights, namely, (1) political and civil rights; (2) social, economic, and cultural rights; (3) solidarity rights; and (4) the rights of indigenous people, are deemed as human rights organizations (Vasak 1977).

## Historical Background

Amid the rise of the concern for human rights since the end of World War II and the subsequent adoption of the Universal Declaration of Human Rights by the United Nations (1948), human rights organizations have grown substantially ever since. The global human rights movement was consolidated by the formation of numerous human rights organizations in the United States and Europe in the 1960s. It was further boosted by the establishment of major international human rights organizations in the 1970s, including Amnesty International, the International Commission of Jurists, the Center for Legal and Social Policy, and Human Rights Watch. In the late 1980s, a model of transnational activism arose pushing for a division of labor between local and international human rights organizations, with the former documenting rights violations on the ground and the latter propagating to the global scene. With the end of the Cold War and the gradual stabilization of democratic regimes in the 1990s, the agenda of economic, social, and cultural rights prevailed into the 2000s and bred a new wave of human rights organizations as of date (Chillier and Timo 2014).

## Categories

There are two ways of categorizing human rights organizations: one is the degree to which their mandates relate to human rights, and the other is the scale of their operations.

### Mandates

In terms of mandates, there are three types of human rights organizations that adhere differently to the concept of human rights. Firstly, there are human rights organizations with the core mandate being the promotion and protection of human rights as defined internationally (Bell and Keenan 2004). They are the "ideal" or "exclusive" human rights organizations whose raison d'être is derived from the fight of human rights (Wiseberg 1992). Human Rights Watch and Amnesty International are some examples.

The second type relates to equality claims of a specific community, thus sharing connection with varied scopes of human rights. The identity constitutions of the community include gender, sexuality, ethnicity, or disability (Bell and Keenan 2004). Typical examples include Disabled Peoples' International, Society for Threatened Peoples International, and International Alliance of Women.

The third type is more peripheral to the concept of human rights. Their mandates involve broader or different primary goals and devote substantial resources to the human rights struggle, like democracy or community development (Bell & Keenan 2004). Examples include Médecins Sans Frontières and Freedom House.

### Scale of Operations

Another way to understand human rights organizations is their scale of operations. One notable type is international human rights organizations, or First World human rights organizations as so termed. They tend to set up extensive branches in various regions of the world, aiming at creating impact and developing norms all over the world. Typical examples include Oxfam and International Commission of Jurists.

The second type of human rights organizations as a counterpart under this category is local human rights organization, or Third World human rights organization. These organizations generally put more emphasis on economic and social rights (Steiner 1991). In fact, with the rising trend of soft authoritarian or hybrid regimes, the term "Third World human rights organization" may not be embracing enough to cap all local human rights organizations, especially those in affluent but illiberal regions.

The classification of human rights organizations into "First World" and "Third World" also signifies their different physical bases, sizes, ideological concerns, types of human rights in focus, and strategies. Comparatively speaking, First World human rights organizations are committed to the liberal tradition with an emphasis on the protection of political and civil rights, the first generation of rights, whereas Third World ones give priority to economic and social rights, the second generation of rights (Steiner 1991). In other terminologies, "ideal" human rights organizations, which focus on political and civil rights, such as Amnesty International, are distinguished from "operational" human rights organizations, which emphasize social, economic, and cultural rights, such as Oxfam or Green Peace (Wiseberg 1992).

## Roles

The roles human rights organizations perform depend on the nature and mandate of individual organizations, yet they share a commonality of functions that enable them to effectively perform in the society. As Claude and Weston (1992) stated, their roles include, but not limited to, information processing; advocacy; developing human rights norms and influencing policy; legal, medical, and humanitarian assistance; solidarity building; and moral condemnation and praise.

### Information Processing

A chief task or specialty of human rights organizations is to collect and disseminate information about rights violations and educating people about the content of their rights. There is a set of guidelines, namely, the "Minimal Rules of Procedure

for International Human Rights Fact-Finding Missions", for human rights organizations to follow in gathering and verifying information regarding human rights situations (Claude and Weston 1992).

### Advocacy

Regardless of the exact mandate of individual human rights organizations, the role of advocacy is at all times fundamental. It means consistent and continuous effort to espouse the claims of human rights and recommending the legislation of specific policy choices in favor of the preferred values (Claude and Weston 1992).

### Developing Human Rights Norms and Influencing Policy

In the societal aspect, human rights organizations are essential in shaping human rights norms both within and beyond the establishment. Conventionally, human rights organizations help draft policy proposals. One prominent example was the formulation of the Universal Declaration of Human Rights (Claude and Weston 1992). Off the stage, they lobbied different stakeholders in the society and educated the public in order to enhance human rights standards in the concerned territory.

### Legal, Medical, and Humanitarian Assistance

One particular role pertaining to the indispensability of human rights organizations is to help the victims of human rights violation with various kinds of assistance. In most cases of human rights violation in which the bureaucracy and the regime are the culprits of the problem, scarce societal resources would be available to the victims. The intervention of human rights organizations by providing humanitarian (material relief and refuge) and professional (legal and medical) support then become crucial in ensuring the rights, and in extreme but not uncommon situations the safety, of individual victims.

### Solidarity Building

In the process of promoting and protecting the rights of individuals in a society, human rights organizations serve naturally as an agent to build solidarity across the world community on the agenda of human rights protection. By sharing knowledge and experience, and collaborations at times, across national boundaries, human rights organization effectively cultivate conscientization and empowerment at the local and international levels.

### Moral Condemnation and Praise

The last role human rights organizations play is to act as the watchdog of regimes and rights violators. As a professional body which follows a stringent guideline of information processing, human rights organizations are obliged to speak the inconvenient truth against any rights violations. Moral condemnation could at best stir up outrage in the society concerning the incidents and bring about remedies of some sort, or at least document the rights violations for long-term advocacy and campaign strategization. At times, human rights organizations, with their weight in the international arena, would praise governments for their positive reforms, encouraging them to continue enhancing the protection of human rights of the citizens in the respective territory.

## Key Issues and Challenges

### Definition of Human Rights

Amid the popularization of the idea of human rights over the past decades, open violations of human rights continue to exist. Importantly, they have become more difficult to be argued against, not to mention condemned (Weston 2006; Poppovic and Vieira 2014: 22). The notion has become blurred and manipulated, thus creating the challenge of a proper definition.

Prevailing the challenge of a proper definition of human rights, there are several developments in sight. Firstly, there has been the tension between the notions of individualistic and communitarian human rights. While individual rights, such as the right to vote, are more emphasized in the West, the communitarian interpretations of human rights, including the right to basic necessities, security, and satisfactory environment, are prioritized in the East and Africa. While the former is well

stipulated in some popular international agreements, such as the Universal Declaration of Human Rights, the latter is showcased by regional consensus, such as the Banjul Charter of Human and Peoples' Rights established by African countries in 1986 (Hellsten 2004: 63–64).

Secondly, there has been the tension of a more liberal and social interpretations of human rights, which divides the First World or the North, and the Third World or the South. As discussed above, there are different generations of human rights. The first-generation defenders, often associated with the First World or the North, tend to exclude other generations of rights from their definition of human rights or take them as only derivative. Similarly, proponents of the other generations of rights, often associated with the Third World or the South, regard the first generation of rights as insufficiently attentive to human needs and inadequate as instruments to correct unjust social order and only as long-term goals to be achieved after protection of social and economic rights attained. The underlying assumption is that the scope of human rights is determined by local, national, or regional customs and traditions. The consequence of these debates, hence, is a sharp disagreement about the legitimate scope of human rights and the priorities among them and the divide between the North and the South. Obviously, the various generations of rights, embedded with the respective conceptions of a good and desirable society and the means to achieve it, are not equally appealing or pressing to everyone. (Weston 2006; Poppovic and Vieira 2014: 22–23).

### The North-South Divide

It follows that First World human rights organizations are often criticized by their Third World counterparts for the former's overstress on individual human rights violations, the neglect of the underlying social, economic, and structural problems which lead to the systemic loss of protection and dignity in the Third World, ignoring the interrelatedness between Third World problems and First World policies, and the neglect of the human rights problems in the First World countries themselves. For instance, it is observed that Amnesty International perceives itself as an impartial organization concerned with human rights violation of individual cases rather than one calling for the advancement of political ideologies that may draw it into political struggle. Third World human rights organizations on the other hand are criticized for their neglect of campaigning for human rights laws to hold their governments accountable and the lack of uniqueness to stand out from other development-based or charity organizations (Steiner 1991).

The end of the Cold War has witnessed some organic adjustment to this North-South divide. Northern human rights organizations have been urged to broaden their missions to include promoting social, economic, and cultural rights on top of advocating liberal ideals and norms. In a similar trend of pursuing a wider range of goals, the Southern counterparts advance new human rights standards, strengthen citizens' organizing capacities, and fight for transforming national institutions (Smith et al. 1998).

In the 1990s, organizations from the South have brought new initiatives into the international agenda, including various platforms to combat poverty, AIDS, and so on (Poppovic and Vieira 2014: 22). With the rising geopolitical tension in the world, especially after the September 11th incident (2001) (Chillier and Timo 2014: 377), the importance of partnerships and solidarity between the North and the South was further highlighted. This, as argued, has helped to integrate the human rights movement across continents and mitigate the perception that the movement is a Western concept promoting only a Western worldview (Brant 2014a: 540).

### New Rights and New Agendas of Human Rights Organizations

Besides, the conflict in the definition of human rights is the need to defend new rights. The right to the city is a good example, which includes the right to land use, the right to urban planning, the right to privacy, and so on and so forth. (Nadar 2014a: 484).

In hybrid and transitional societies, the right to maintain the local identity stands out as an emerging human rights need. As argued, human rights needs cannot be understood conventionally in

such societies with new human rights issues and different patterns of human rights abuses. In these societies, such as Russia, post-Soviet societies in Central Asia, and post-conflicts societies, the state has attempted to create an official version of national identity that homogenize and repress individual or ethnic memories, and has adopted authoritarian ruling measures that help strengthen regime loyalty but weaken the pro-liberal and pro-rights opposition voices (Bell and Keenan 2004). Theoretically, the right to maintain the local identity is a part of human rights. The second generation of rights includes cultural rights which allow minority groups to preserve their cultural identity and that in turn has implications for civil and political as well as economic and social rights. The third generation of rights contains the right to (political, social, economic, and cultural) self-determination among all other rights, which helps justify the right to maintain nonmaterial, alternative lifestyles. Nevertheless, in some contexts, such rights are too ambiguous and not as equally pressing as other international human rights norms. A review on the interconnectedness of the different types and generations of rights both theoretically and in the context of real politics and the organizational tendency to deal with human rights violations primarily on case-by-case basis is therefore essential. (Eide 2006; Kweitel 2014: 265).

## Human Rights Organizations and Foreign Policy

The right to peace is another example that signifies the changing definition of human rights which impacts on the scope and agenda of human rights organizations. There are several dimensions to the right to peace, including international peace and security, disarmament, human security, resistance to oppression, peacekeeping, the right to conscientious objection, and freedom of religion and belief. Associated with these concepts is the awareness of the internationalization of crime of aggression which has threatened international peace and security in recent years. Nevertheless, many major international human rights organizations have been indifferent to this and declined to campaign for the ratification of the aggression amendments adopted in the 2010 Resolution on the Crime of Aggression. As a result, the role of the Coalition for the International Criminal Court has largely been marginalized (Schabas 2015: 357–358).

The responses of the major international human rights organizations are relatively aloof on the issue of crime of aggression. Amnesty International, for instance, stated that it has not "taken a stance on the definition of the crime of aggression because its mandate – to campaign for every person to enjoy all of the human rights (civil and political and economic, social and cultural rights) enshrined in the Universal Declaration of Human Rights and other international human rights standards – does not extend to the lawfulness of the use of force" (Schabas 2015: 358). In a similar stance, Human Rights Watch asserted, "its institutional mandate includes a position of strict neutrality on issues of *jus ad bellum*, because we find it the best way to focus on the conduct of war, or *jus in bello*, and thereby to promote our primary goal of encouraging all parties in a conflict to respect international humanitarian law. Consistent with this approach, we take no position on the substance of a definition of the crime of aggression" (Schabas 2015: 358). One may however argue that the right to peace and against aggression is a basic condition for fulfilling the desired human rights stated in the Declaration (Schabas 2015: 358).

## Challenges to Legitimacy

There is a very old criticism that human rights organizations do not represent victims or the citizens. And the more professional the organizations have become, the more they are detached from their service targets (Nadar 2014b: 531). On top of this, globalization has made the world even more multipolar, making power distribution more dispersed, which further aggravates the issue of human rights organizations' legitimacy and representation (Weston 2006; Chillier and Timo 2014: 377). Various forms of monitoring over the work of civil organizations have been called for (Lavalle 2014: 296).

## Measurement of Impact

Like other human services, the effectiveness of human rights organizations is hardly measureable.

The impact of human rights advocacy may be too long term to be determined due to the very nature of advocacy itself. Advocacy work is even more difficult to be evaluated with human rights organizations that are case based, which means that the long-term objectives of the organizations may not be specific enough. Some organizations are contented that although they cannot determine their influence on the government, they can always help the victims, the human rights defender, and their family. This kind of thinking helps assure human rights workers of their contribution and thereby sustain the organizations' relevance and survival (Brant 2014b: 370).

### Norm Setting Versus Implementation and Local Versus International Organizational Cooperation

It is argued that, in the past decades, the international human rights framework has overemphasized on norm setting to establish a framework that calls for universality of human rights and unified international attention and dialogue. However useful this may be, international human rights organizations have neglected on the ground the need for real implementation of human rights at the local and/or national levels (Brant 2014a: 539).

Relatedly, the traditional model of some major international human rights organizations, such as Amnesty International and Human Right Watch, was one of documenting human rights violations that speaks for the organizations' mandate. A challenge prevails with more and more local and national human rights organizations that are ready to speak for the country themselves, thus creating tension between international and national organizations. One of the changes in Amnesty International's approach to alleviate this problem is to go inside the regions and work side by side with the human rights organizations at the national or local levels (Brant 2014b). Another important step was the creation of the International Network of Civil Liberties Organizations (INCLO) in 2012. INCLO is a pioneering initiative that brings together ten human rights organizations at the national level from different continents to take charge of coordinated international work (Weston 2006; Chillier and Timo 2014: 380).

Amnesty International and other international groups are conscious that they need to work on and from both the South and the North alike. Over the last few years, Amnesty International for example has begun to cooperate with more of the expertise in the South. There grows a trend whereby human rights organizations become more engaging on a daily basis with key local partners and more responsive to rights violations in real time (Nadar 2014b: 533).

Some authors have referred to this process as "vernacularization" which signifies the negotiations between local, national, regional and global systems with the goal of framing local demands in terms of global human rights principles and practices. A good example is Center for Legal and Social Studies, which aims to consolidate its impact "on the ground" (Chillier and Timo 2014: 382).

## Conclusion

Broadly speaking, human rights organizations are the organizations that advocate or promote interests under the four generations of rights, namely, political and civil rights; social, economic, and cultural rights; solidarity rights; and the rights of indigenous people. Human rights organizations have flourished since the end of World War II. They can be categorized according to the degree to which their mandates relate to human rights and the scale of their operations. The roles of human rights organizations vary, depending on the nature of mandate of individual organizations, yet they share a commonality of functions, such as information processing, advocacy, developing human rights norms, and influencing policy; legal, medical, and humanitarian assistance; solidarity building; and moral condemnation and praise. Human rights organizations have encountered various challenges. These include the challenges of negotiating a proper definition of human rights, developing partnership and solidarity of the human rights movement across continents, defending new conceptions of human rights

amid new forms of human rights violation, reexamining the justifiability of the right to peace and against aggression, developing standards to measure organizational legitimacy and effectiveness, and handling the process of vernacularization.

# Human Rights Practices in Uganda

Pius Gumisiriza
School of Public Policy and Governance,
Uganda Management Institute, Kampala, Uganda

## Synonyms

Human rights; Laws; Policies; Rule of law; Uganda

## Definitions

Human rights are defined in this entry as the inherent and indivisible legal guarantees of

freedom that belong to all human beings and applicable to all everywhere at all times irrespective of race, gender, political opinion, or any other status (Coquoz 2012).

## Introduction

This entry discusses ancient and spread of human rights practices globally and human rights practices that relate to the abuse of political power, torture of citizens, brutal murders, oppressive laws, abuse of the rule of law, and economic policies that are not only bad but also poorly implemented in Uganda.

## Human Rights Charters

The world's first Human Rights Charter was issued in 337 BC, when Cyrus the Great and founder of the One World United State of the Achaemenid Persian Empire took over Babylon (present day Iraq) with no fight or bloodshed. Cyrus the Great declared that slavery must be abolished on the face of the Earth, subject nations, and peoples all over the vast empire that stretched from India and Central Asia to Europe, the Middle East, Africa, much of Asia, and virtually every known part of the world, except for the Greek Athens and Sparta. These declarations written in the Akkadian language with cuneiform script were recorded on a baked-clay cylinder now known as the Cyrus Cylinder which has now been recognized as the world's first charter of human rights. Under Cyrus the Greats' empire, all subject people/nations were allowed to exercise their local traditions, cultures, and ways of life, and all people were considered equal before the law, regardless of their color, race, creed, religion, or sex. Women were allowed to serve in the military and government and as military as well as civilian commanders. Appointment into positions of authority was based on merit and courts administered by royal judges who arrived unannounced and with no prior notices conferred justice to all people in the empire. From Babylon, human rights ideas spread quickly to Greece, India, Rome, many parts of Europe, and eventually the entire world. Documents asserting individual rights, such as the 1215 Magna Carta, the 1628 Petition of Right, the 1787 US Constitution, the 1789 French Declaration of the Rights of Man and of the Citizen, the 1791 US Bill of Rights, and in recent times the 1948 Universal Declaration of Human Rights, were all written precursors to many of today's human rights documents. The first four articles of the Universal Declaration of Human Rights 1948 parallel the provisions of Cyrus the Great Cylinder that have been translated into all six official languages of the United Nations. Uganda ratified the three fundamental United Nations agreements on human rights which include the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social and Cultural Rights and is also a signatory member of the African Union Human Rights Convention. Thus it pledged itself to respect, protect, and promote these different human rights as listed in these conventions. However, the country has over the last five decades experienced abusive human rights practices as discussed hereunder.

## Abuse of the Presidency

At independence in 1962, Uganda adopted a Westminster system of government with a non-executive president (Kabaka Muteesa), an executive prime minister (Milton Obote), and an official opposition party (led by Benedicto Kiwanuka). In 1966, the then Prime Minister Milton Apollo Obote abrogated the independence constitution and declared Uganda a republic with himself as a president. He ordered a military attack on Kabaka Muteesa's palace and started political power abuse the country has never fully recovered from. The members of the parliament at the time never went back to seek peoples' mandate but would just sit in the parliament and extend their tenure. In 1971, Obote was overthrown by Idi Amin who declared himself a life president, ruled by military decree and killed anyone that

dared to question his power including the former prime minister and chief justice at the time Benedicto Kiwanuka, the Anglican Archbishop Janani Luwum, the former Bank of Uganda governor Joseph Mubiru, the Makerere University vice chancellor Frank Kalimuzo, the renowned playwright Byron Kawadwa, and his own ministers. His abuse of power is considered the worst on the continent, and by the time he was overthrown in 1979, over half a million people were horrendously murdered. Amin was overthrown in 1979, and in 1980 Milton Obote came back to power through a rigged election. He also unleashed another reign of terror that also left another 500,000 people dead by 1985 when Yoweri Museveni and his NRA rebels captured power after a 5-year bloody guerrilla war (Amnesty International 1985). In his inaugural speech in front of the parliament, President Museveni proclaimed that their capture of power was not a mere change of guards but a fundamental change in the politics of Uganda. Museveni became very famous by castigating African leaders who overstayed in power and argued that they were Africa's biggest problem. He proclaimed that he was not interested in power and requested his bush war comrades that he should be allowed only 4 years to restore peace, stability, and transition to democracy. Today after 32 years in power, only Teodoro Obiang Nguema Mbasogo of Equatorial Guinea and Paul Biya of Cameroon eclipse his rule. In December 2017, President Museveni and his dominant NRM party in the parliament engineered a parliamentary vote that scrapped the 75-age limit removal for the Ugandan constitution, thus making him eligible to contest again in 2021. Museveni changed the argument and now says that Africa's problem is leaders who stay in power without being elected fairly. However, in the last 18 years, President Museveni has presided over elections that the courts in Uganda and international observers have concluded not to be free or fair. For instance in 2016, he presided over an election that most observers including the European Union Election Observation Mission described not free and fair. They categorically state that the National Resistance Movement's (ruling party) domination of the political landscape distorted the fairness of the campaign and state actors were instrumental in creating an intimidating atmosphere for both voters and candidates. The incumbent had access to funding means and public media that were not commensurate with those available to his competitors. The lack of transparency and independence of the electoral commission and its markedly late delivery of voting material on election day to several districts considered opposition strongholds – most notably in Kampala – decreased the opportunity for voters to cast their ballots. The Uganda Communications Commission blocked access to social media on election day that unreasonably constrained freedom of expression and access to information. Apart from not having free and fair election, which abuses people's right to choose who should govern them, the Uganda Constitution 1995 that was made under President Museveni's stewardship concentrates a lot of power in his hands including the power to appoint the chief justice (Articles, 142), chairperson of electoral commission (Article 60), inspectorate general of government (Article 213), inspectorate general of police, head of public service (Article 173), Bank of Uganda governor, and Secretary to the Treasury (Article 172a). All safeguards that were put in the constitution to limit one leader's entrenchment on the presidency especially the 2-term and 75-year limits have been scrapped every time they threatened to stop Museveni's perpetual stay in power.

## Torture of Citizens

Acts of brutal torture and beating of people that violates people human rights are not new in Uganda or Africa in general. In fact, they are one of the tools that authoritarian rulers use to consolidate and entrench their stay in power (see Odunze 2016). However, from around 2010, beating and brutal torture of innocent people, opposition politicians, and journalists by security forces in Uganda draws parallel with those that happened under the past regimes especially those of Amin and Obote that President Museveni castigated seriously. For example, during the debates and

the real process of amending the constitution to remove the presidential age limit in December 2017, the entire world witnessed the invasion of parliament by the elite presidential guards (Special Forces Command) who violently and terribly beat up members of the parliament who opposed to the amendment. Following the constitution amendment in 2017, the year 2018 has witnessed an emergence of a new kind of opposition to President Museveni's regime in the form of *People Power Movement* spearheaded by Hon. Robert Kyagulanyi aka Bobi Wine, a youthful and popular musician turned politician. In three recent parliamentary bi-elections (Jinja, Bugiri, and Arua municipalities), candidates supported by Hon. Robert Kyagulanyi have defeated those supported by other political parties including President Museveni's NRM party. On August 13, 2018, while coming from the campaign rally of his party candidate in the Arua municipality parliamentary bi-election, President Museveni's motorcade came face-to-face with a procession of supporters of Kassiano Wadri who was also supported by Hon. Kyagulanyi. It is alleged that someone from the Kassiano Wadri supports threw a stone into the presidential motorcade and broke the back glass of the vehicles President Museveni uses to carry luggage. Soldiers from the Special Forces Command (SFC) were restrained from shooting into the crowd, and the president proceeded to his waiting helicopter without any other chaos. However, according to the eyewitnesses, the same soldiers came back into Arua town and went into the hotels looking for Hon. Kyagulanyi and other leaders in the Kassiano Wadri team. Hon. Kyagulanyi's driver was shot dead in Kyagulanyi's car in what many observers have argued was a plan to kill Hon. Kyagulanyi. Kyagulanyi, Kassiano Wadri, Hon. Mutebi Zaake, Hon. Paul Mwiru, Hon. Gerald Karuhanga, Hon. Mike Mabike, and other 34 people were hunted down by the SFC soldiers and brutally tortured and are now facing treason charges. President Museveni has put himself on record as the person who directly authorizes these operations and officers well known to have engaged in gross human rights violations that at the same time entrench the regime have been deployed to even bigger roles or gone unpunished. Similar acts of arbitrary arrest, use of excessive force resulting in death, torture against victims especially in safe houses, detention without trial, and extrajudicial executions for those who don't support President Museveni have been well documented previously (FHRI 2010). However, the difference this time is that these incidents of brutal beatings of people including members of the parliament, denying them medical treatment of their choice, charging of political opponents with trumped-up cases, brutal beating of journalists by members of the armed forces, impunity by torture perpetuates, and denying citizens their rights such as freedom of assembly and speech by the state have attracted strong criticisms from the Chief Justice Hon. Bart Katureebe, the speaker of the parliament Hon. Rebecca Kadaga, the European Union delegation in Uganda, religious leaders including the Mufti of Uganda Sheik Ramadan Mubajje, Archbishop Cyprian Kizito Lwanga, huge demonstrations in Nairobi, London, and some cities in the USA and on the streets of Kampala, much as these were violently crushed by the military. The speaker of the Ugandan parliament Hon. Rebecca Kadaga wrote two letters to President Museveni demanding an explanation as to why officers from the Special Forces Command were brutally torturing opposition members of the parliament and demonstrators with impunity. The president has responded to these letters and categorically thanked the officers for doing their job, declared that he is the one that ordered the Arua operation, castigated not only the brutalized MPs, but also gazetted the People Power Movement as a terrorist organization and ordered a crackdown on some international NGOs whom he accused of being agents of foreign interest that want to harm Uganda. Labeling an organization, movement, or group of people as terrorists in Uganda comes with a lot of consequence such as serious criminal cases under the Anti-terrorism Act. In addition, NGOs working on issues of governance, rule of law, and human rights have been targeted using the restrictive Anti-money Laundering Act 2013. Security forces have raided some NGOs such as

ActionAid, closed their offices, intimidated their employees, and frozen their accounts accusing them of being the funnels through which money from abroad funding political opposition groups is channeled.

## Rule of Law

The rule of law involves a system of clear and just laws that are evenly applied so as to enable fair functioning of a society including protection of fundamental human rights (O'Connor 2015). An independent, impartial, honest, and competent judiciary is an integral part in upholding the rule of law. To have this kind of judiciary in a country, judicial appointments should be made on the basis of a clearly defined and by publicly declared process that ensures equality of opportunity, appointment on merit, progressive attainment of gender equity, and the removal of other historic factors of discrimination (Ndulo 2011). The rule of law in Uganda has been undermined in several different ways and for different reasons. The power to appoint judges in Uganda is vested in the hands of the president, and in a scenario where President Museveni has been in power for over 30 years, almost all judges have been appointed by him. Many observers have argued for years that the appointment of judges is corrupt and influenced by partisan interests which undermines the rule of law because judges serve the interests of the appointing authority especially in politically sensitive cases that result in de facto denial of justice. The independence and effectiveness of the judiciary to deliver the rule of law are also undermined by poor remuneration of judicial officers that has fueled rampant corruption. In many cases, judges extract bribes and have predetermined judgments even before hearing cases. Lower order court clerks solicit bribes for producing or hiding certain information that is crucial to cases; prosecutors are bribed to avoid bringing a case forward or influence them to assess evidence in unfair manner. These corruption circumstances in the judiciary make the process of getting justice so difficult and painful that people especially the poor who cannot buy their way through give up (Adoch 2011). The rule of law where all persons and authorities are bound by and equal under the law is still lacking. What actually exist is rule by law where the will of the strong is meted on the weak or the wish of those in authority is enforced on those in opposition as is usually witnessed in the harassment of opposition figures or their supporters and selective application of the law.

## Unfair Laws

For laws to uphold or promote human rights protection, they must be fair to all people in a society. However, in Uganda, there still exist archaic and current laws that awfully affect human rights but are still in practice just because they serve the political interests of the regime. For instance, Uganda still uses the Official Secrets Act 1964, a law that was inherited from colonialism intended to curb espionage during the Cold War and also to shield the administration of the day from public scrutiny (Ngabirano 2012). The Official Secrets Act 1964 regulates the interaction between agents of foreign powers on the one hand and access to official documents on the other. An official document under the Act is defined to include a passport; any naval, army, air force, police, or official pass; permit; certificate; license; or other documents of a similar character. This law entrenches a culture of secrecy in all matters of public administration and has been used to deny the public access to information involving huge contracts, procurement, government expenditure, and investments. For example, the government issued oil exploration and production licenses to oil companies in secretive deals where the country probably got a poor bargain (Ngabirano 2010). If the right of access to information on public resource contracts like oil and other minerals is to be realized, there is a need to amend or possibly repeal the Official Secrets Act 1964, or the public should at least have access to this information through courts of law and parliament.

In 2010, the government of Uganda passed into law the Interception of Communications

Act that permits the Minister of Security to tap all forms of communication in the country. The Act provides for the registration of SIM cards and interception and monitoring of certain communication in the course of their transmission through telecommunication, postal, or any related service. The stated objectives of the law were to thwart and prevent a terrorism action and organized crime. Undesirably, the law violates a right to privacy and lacks adequate safeguards to ensure respect of rights to freedom of expression enshrined in the constitution of Uganda. Besides, the law gives the government far-reaching discretionary powers in surveillance and interception of electronic telecommunications and postal communications between individuals, groups, and organizations. The broad and undefined basis for interception of communication also allows for possible intrusion into communications of individuals and professionals such as journalists, human rights defenders, and political dissidents engaged in legitimate activities, exercising their human rights. This law came in the aftermath of the 2010 World Cup terrorist attack by Al-Shabaab terrorist that left over 80 people killed while watching the 2010 football World Cup finals. The Interception of Communications Act 2010 has had far-reaching impact on human rights as it is used and abused for other purposes other than the stated one. For example, it has been used to conduct espionage, surveillance, and curtailing dissenting politicians' plans, operations, and organization capacity. The law has curtailed the ability of the opposition politicians and activists to carry out any effective political work (HRNJU 2012). In addition this law has made the work of many journalists and their sources very difficult due to the continuous disruptions by state agencies. The government has further used the law to break into people's homes and take them away only with suspicious reasons (FHRI 2010). This law would not be bad if used to protect the public and their property and fight terrorism and organized crime. It is recommended that the government refrains from eavesdropping on private citizens and harassing genuine dissenting voices by using this law; the implementers of this law should be restricted to acts of terrorism and organized crime.

In 2013, the government of Uganda passed into law the Public Order Management Act 2013 that provides the police discretionary powers to veto gatherings in public places and break up political meetings of three or more people discussing political issues without prior police permission. Under this law, the police has a right to deny or accept permission for people to assemble. This law violates freedom of expression, assembly, and political participation provided for under the Uganda Constitution and the Universal Declaration of Human Rights. The motivation for this law sprung from the fear that the Arab Spring revolution that saw many long-serving Africans and Arab dictators lose their grip on power would spread southward and inspire regime changes in countries under similar conditions. Indeed, in Uganda, similar situations had begun to evolve under the walk to work demonstrations. Political activists had embarked on a walk to work campaign with an aim of forcing government to act on skyrocketing inflation. In return, the government used brutal force to crack down on protesters who were vowing to continue demonstration against spiraling food and fuel prices. Security forces harassed and locked up opposition politicians and their supporters who are taking part in a protest. The law allows the police to use firearms in self-defense or against those resisting arrest (see Amnesty International 2014). From then on, the police and most recently other security organs such as the UPDF and the elite Presidential Guard (the Special Forces Command) are always in the daily headlines for the wrong reasons like teargassing peaceful demonstrators, beating innocent citizens and journalists, dispersing opposition politicians and activists' rallies, and carrying out abusive, illegal preventive arrests and detentions, thus violating people's right to assembly, expression, political participation, and speech. In 2013, out of the 124 cases investigated and documented by the Human Rights Network for Journalist in Uganda, the Uganda Police Force occasioned 85 cases, and freedom of expression in Uganda was ranked the second highest violated human

right (HRCU 2013). Furthermore, the government moved forward to ban open-air talk shows commonly referred to as people's parliament (HRNJU 2012). It ought to be pointed out that no state can be sustainable if it oppresses its own people. Instead of trying to contain dissent by force, the government should concentrate on delivering jobs, welfare, income, democratization, and development. These are better tools to win legitimacy than the use of force. The police and other security forces should restrain and use minimum force to manage demonstrators rather than the clobbering of people as is the case now bearing in mind that they are paid to protect human rights and not violate them, and the officers involved that are now protected by powerful forces in the regime should also understand that in case of regime change, they may also be called upon to answer as individuals for these human rights violations.

## Policies that Reinforce Human Rights Abuses

During their bush war days, Museveni and his NRA colleagues espoused a vision to build an integrated and self-sustaining economy using a strong socialist-nationalist economic program. This plan hit a dead end when Museveni turned to donors for aid to help him resuscitate a collapsed economy at the beginning of the early 1990s. With pressure from the IMF, the World Bank, and Western donor countries, Museveni was forced to adopt a neoliberal economic policy dispensation and quickly became neoliberal economic orthodoxy ardent convert. With the guidance of donors especially the World Bank and IMF, he implemented wide structural adjustment policies that included wholesale privatization of state-owned enterprises including those that were even performing better such as the Uganda Commercial Bank, retrenched many government workers, removed agricultural subsidies, and liberalized the economy; the government introduced user fees, scaled back on the provision of social services, and delegated much of this responsibility to private sectors, donors, and NGOs. The provision of such services is a human right; the state should play an activity role in providing them whether they are profitable or not. The proponents of this dispensation credit these reforms for the impressive economic growth and macroeconomic stability of Uganda registered from the 1990s to the early 2000s manifested in GDP growth average of 6%, single-digit annual and core inflation, stable exchange rate, and tremendous reduction in poverty head count. On the other hand, critics argue that implementing a full package of neoliberal policies in a predominantly peasant society with weak state institutions and a ruined economy exposed Uganda to an infectiously violent mode of capitalism that manifested itself in corrupted privatization processes of strategic and key economic assets of the country, abandoning investment in the agricultural sector that resulted in the collapse of the cooperative movement and low agricultural productivity, a promise of a private sector-led industrialization transformation that did not happen. The country is still dominated by cosmetic value addition like processing sugar and last-stage assembling, and almost all privatized public industries and enterprises have failed to live up to their hyped expectations of private sector-led growth as many have closed down, others are operating in serious losses, while others survive on state subsidies (Nakaweesi 2015). Besides all these poor neoliberal policy outcomes, service delivery in education, housing, and health is very poor resulting in the majority of Ugandans living in indecent houses and acquiring poor-quality, theoretical, and inappropriate education and poor health services as 16 women die daily due to maternal complications or failure to access critical health services, with infant mortality rate at 60.82 deaths/1,000 live births and food insecurity (Anena 2013). The argument that the private sector is better positioned to champion growth and development is deeply flawed, hypocritical, and based on misreading of economic history. Nearly all of today's rich countries used and still use state intervention to develop their economies contrary to what the neoliberal policy orthodoxy would have us believe (Chang 2002).

Further still, under the neoliberal policy dispensation, Uganda relaxed its regulatory regime and tilted its investment laws to favor foreign investors. Big corporations with huge money and massive support from their home countries or political connections in Uganda have abused the regulation-making mechanisms through underhand lobbying that has resulted into regulatory capture, massive tax exemptions, and repealing of tough regulations allowing them free reign to operate with fewer public safeguards and access to public resources like land, water, airwaves, and minerals. They are allowed tax incentives and exemptions under the Investment Code 1991, the Income Tax (Amended) Act 2010, and the Value Added Tax (Amended) Act 2015. Foreign companies licensed by the Uganda Investment Authority are exempted from import duties and VAT on imports of any plant, machinery, equipment, vehicles, or construction materials for an investment project, withholding tax on external loans and stamp duty, export tax on exported goods, and withholding tax and obtain a 10-year corporate income tax holiday and depreciation allowance for all depreciable mining assets of 30% (TJNA and AIU 2012). The argument for these incentives is that they can woo foreign investors into the country, create employment, and produce for export. However, the reality and consequences have been different. The tax incentives and exemptions are leading to very large revenue losses required to reduce poverty and improve the general welfare of the population. The African Development Bank estimates that losses from tax incentives and exemptions are at least 2% of GDP, amounting to US$ 272 million in 2009/2010 (ADB 2010). In 2014, BIDCO Uganda Ltd got a tax exemption of more than UgShs 540 billion for 8 years and a tax holiday for 25 years (Mugerwa 2014). This is enough money to provide substantial basis services to the impoverished large section of the population. There are many examples where multinational corporations have used their influence to their advantage and caused massive human rights violation. The British American Tobacco Company, which produces cigarettes, has continued with its activities in Uganda despite the fact that cigarettes are harmful to health and a leading killer of many Ugandans (Okurut 2013). Notwithstanding its existence since 1941, the company had influenced the legislation body to delay the discussion of the Tobacco Bill to regulate the tobacco industry until 2014. The continuous air pollution by emission of tobacco smoke, dust, and smell to the environment is a violation of the public's right to a healthy, clean environment and life. It is estimated that 13,500 people die every year due to tobacco-related illnesses. In Mulago Hospital, 75% of all patients with oral cancers reported in 2008 had a history of tobacco smoking (Okurut 2013). Because of relaxed regulations, it is estimated that Uganda loses 23,000 people, including 19,700 children under 5 due to pollution-related diseases such as respiratory *infections.* It is recommended that the underhand influence of corporations on the legislative processes be curtailed so that groups and individuals acting in the public's best interest have access to a more level playing field. Ugandan laws are also silent on the exploitation of workers and employment of minors while legalizing harmful social economic activities especially gambling. Gambling in Uganda is permitted by the Gaming and Pool Betting Act 1968 and in a country with 80% youth unemployment and broken aspirations; gambling has provided an enticing but dangerous trap. Gambling has resulted into many negative vices such as addiction, depletion of personal savings and finances, and crimes such as money laundering, match fixing, and petty thieving. Another social ill has been the exploitation of workers through lack of minimum wage legislation and employing of minors. In Uganda, people do not have legal recourse to claim their rights on working in a decent environment, number of hours and minimum pay, and any other social benefits like sick or maternity leave. In most homes and many working places, many underage people are employed as house girls, boys, and caretakers without any legal restraint on the employer (UYDEL 2009). It is estimated that 3.8 million (approximately 32% of all children) Ugandan girls and boys are working. Of these children, 1.7 million (16%) are child

laborers, majority of whom are aged between 10 and 14 years. Child laborers have been grossly oppressed and exploited with no rights at all but only with responsibilities. Many children especially girl child have been sexually abused, tortured, and harassed by employers, employees, and clients. They are quite often denied food and wages in case of any mistake and subjected to long hours of work in risky areas without any protection, and many have lost their lives, while others have been amputated.

## Conclusion

While most of the public anger is focused on the political rights violations manifested in torture and harassment of people by security and other state officials, the erosion of human rights runs deep in Uganda. Many abuses are embedded within the laws and policies that have been pursued of the last two decades and require concerted efforts to correct. Uganda aims to transform into a middle-class, industrial, and modern country by 2040, and if it is to achieve this vision, it should first of all adopt laws and practices that advance the aspirations of its people. These laws should be properly implemented so that the rule of law not rule by law where the interests of the strong are meted on the weak is the order. It is easy to have beautiful laws on papers, but if the practice is awful, it is rather wastage of time and a time bomb. It is in the interest of all stakeholders to engage in meaningful crafting and molding of laws that promote people's human rights. It is also recommended that the government makes assessment and rethinks its position because these policies implemented over the last 20 years have failed. Going forward, a new policy and regulatory framework need to be well crafted and put in place.

# Human Trafficking

Kristie Roberts-Lewis[1] and Whitney Bexley[2]
[1]Troy University, Atlanta, GA, USA
[2]Street Grace, Atlanta, GA, USA

## Synonyms

Commercial sexual exploitation of children; Domestic minor sex trafficking; Human trafficking; Labor trafficking; Sex bidding; Sex slave trade; Sex slavery

## Definition

Sex trafficking – "recruitment, harboring, transportation, provision, or obtaining of a person for the purpose of a commercial sex act in which the commercial sex act is induced by force, fraud, or coercion or in which the person induced to perform such an act has not attained 18 years of age" (22 U.S.C. § 7102 (9–10)).

## Introduction

Sex trafficking has become one of the worst phenomena to emerge over the last decade and has and will continue to impact the social, psychological, economic, and cultural landscape of girls and women around the globe. Terms such as sex trafficking, sexual exploitation, human trafficking, sexual slavery, sex bidding, and the sex trade industry have all attempted to explain a global pandemic that presents an international crisis. The sexual exploitation, trafficking, trading, bidding, and slavery of children are a virulent offense against human rights and, more opulently, women and girls. Regrettably, the aforementioned terms have been associated with and limited to offenses against children in the international corridors of the world while ignoring the ecumenical growth of these issues in the United States. Once considered an international epidemic, today sex trafficking has reached the corners of nearly every American state and is threatening to impact the lives of hundreds of thousands of children each year.

According to US State Department, 600,000–800,000 people are trafficked across international borders every year, of which 80% are female and half are children (Trafficking in Persons Report 2007). The National Center for Missing & Exploited Children estimates that 100,000–300,000 children are at risk for being sold for sex in the United States alone. The Federal Bureau of Investigations (FBI) notes that youth between the ages 6 and 19 are subject to sex trafficking, while the average age a victim is first sold for sex is between the ages of 12 and 14 years. This is the worst kind of human violation and is the third-largest international criminal enterprise in the world generating in excess of $32 billion dollars a year, largest lucrative industry behind illegal drug and arm trafficking (Walker

and Hill 2011). According to the FBI, it is estimated that 293,000 children in the United States are at risk for becoming victims of commercial sexual exploitation.

Various terminologies utilized to scaffold a broader understanding of sex trafficking have also created a wealth of confusion in terms of how policies, programs, and services are leveraged to assist those most vulnerable. Hence, this entry will attempt to reconcile misconceptions while highlighting the need for strategic, comprehensive polices to address the issue of sex trafficking while appropriating best practices and models of care that provide opportunities for rehabilitation. Public policies/programs traditionally were designed to eradicate social problems while protecting the most vulnerable of society. The ASPA Code of Ethics enumerates this commitment in its standard to "strengthen social equity" by treating "all persons with fairness, justice, and equality and promoting initiatives to reduce unfairness, injustice, and inequality in society." Given Public Administrators' deference to social justice and equality, it is important that we seek to address the oppression, exploitation, and victimization of children. The commercial sexual exploitation of children (CSEC) refers to the sexual abuse of a minor for economic gain and involves physical abuse, pornography, prostitution, and the smuggling of children for unlawful purposes. Curtis et al. (2008) suggest that, while boys are also frequently victims of child sex trafficking, they can represent nearly 50% of victims. Unfortunately, very little data on this demographic is available in the Atlanta area, and so this entry focuses primarily on underage girls exploited for sex.

## Defining Sexual Exploitation/Trafficking

Sex trafficking is defined as the "recruitment, harboring, transportation, provision, or obtaining of a person for the purpose of a commercial sex act in which the commercial sex act is induced by force, fraud, or coercion or in which the person induced to perform such an act has not attained 18 years of age" (22 U.S.C. § 7102 (9–10)). To be punishable, the offense must involve a severe form of trafficking involving:

- A person under the age of 18 induced to perform a commercial sex act
- An adult induced by the use of force, fraud, or coercion (TVPA 2000)

Trafficking of underage persons who are subject to force, fraud, or coercion is a serious violation of human rights (TVPA 2000).

According to 18 U.S. Code § 2251 – sexual exploitation of children involves:

> Any person who employs, uses, persuades, induces, entices, or coerces any minor to engage in, or who has a minor assist any other person to engage in, or who transports any minor in or affecting interstate or foreign commerce, or in any Territory or Possession of the United States, with the intent that such minor engage in, any sexually explicit conduct for the purpose of producing any visual depiction of such conduct or for the purpose of transmitting a live visual depiction of such conduct, shall be punished as provided under subsection ©, if such person knows or has reason to know that such visual depiction will be transported or transmitted using any means or facility of interstate or foreign commerce or in or affecting interstate or foreign commerce or mailed, if that visual depiction was produced or transmitted using materials that have been mailed, shipped, or transported in or affecting interstate or foreign commerce by any means, including by computer, or if such visual depiction has actually been transported or transmitted using any means or facility of interstate or foreign commerce or in or affecting interstate or foreign commerce or mailed.

In a nutshell the sexual exploitation of children involves the act of employing, using, persuading, inducing, enticing, or coercing a minor child to engage in sexually explicit conduct for the purposes of producing visual depictions such as indecent touching, use of sexually explicit language, child pornography, forced marriage, rape, incest, sexual slavery, and the transportation of a minor from one state to another to engage in any of the aforementioned.

**Labor trafficking** is the recruitment, harboring, transportation, provision, or obtaining of a person for labor or services, through the use of force, fraud, or coercion for the purposes of

subjection to involuntary servitude, peonage, debt bondage, or slavery (22 U.S.C. § 7102 (9)).

**Human trafficking** on the other hand is defined as the "recruitment and transportation of people from one place to another, one country to another, by using deception or force for the purpose of exploitation" (it is considered a criminal activity which violates human rights). The **commercial sexual exploitation of children** (CSEC) refers to the sexual abuse of a minor for economic gain and involves physical abuse, pornography, prostitution, and the smuggling of children for unlawful purposes.

In an effort to understand the trafficking definition, there are three considerations. First, the process action involves the manner or channels by which a victim is introduced/initiated into the world of sex trafficking. Second is the particular means by which the person is recruited/obtained by force, fraud, or coercion – (a) threats of serious harm to or physical restraint against any person; (b) any scheme, plan, or pattern intended to cause a person to believe that failure to perform an act would result in serious harm to or physical restraint against any person; or (c) the abuse or threatened abuse of the legal process (22 U.S.C. 7102 (3)). Exploitation is an inherent component of trafficking involving the force of victims into prostitution and requiring them to commit sexual acts for the express intent of developing pornographic materials. Third and finally, victims are recruited for the purpose of involuntary servitude – a condition of servitude induced by means of any scheme, plan, or pattern intended to cause a person to believe that if the person did not enter or continue such condition, that person or another person would suffer serious harm/physical restraining or the abuse or threatened abuse of the legal process (22 U.S.C. 7102 (6)); **debt bondage** is the status or condition of a debtor arising from a pledge by the debtor of his or her personal services or of those of a person under his or her control as a security for debt, if the value of those services as reasonably assessed is not applied toward the liquidation of the debt or the length and nature of those services are not, respectively, limited and defined (22 U.S.C. 7102 (5)). slavery or sexual exploitation. The term **commercial sex act** means any sex act on account of which anything of value is given to or received by any person (22 U.S.C. 7102 (4)).

The recruitment process involves several distinctive patterns. First victims may be trafficked under the guise that the trafficker is romantically interested in them. The perpetrator heavily courts the victim and showers them with love, gifts, and money. Once trust and a strong bond have been established, the trafficker flips the script and demands control and requires the victim to reciprocate the love by performing various acts. A second method that has been common is the trafficker will attempt to recruit victims with the lure of modeling jobs (which may require pornographic videoing) while enticing and charming the victim with an opportunity that is ultimately too good to be true. The trafficker offers not only a job but offers exotic cars, travel opportunities, cash, and housing. Once the victim accepts the offer and has been exposed to the aforementioned benefits of the job, the trafficker methodically introduces the idea of entertaining gentleman clients as a way to earn extra money. A third method is related to one of the oldest professions in the world, prostitution, and despite whether it is legal or not in some parts of the world, this does not protect the victim from the abuse, threats of violence, coercion, and other deleterious aspects of this very dangerous profession.

## Problem

In 2000, the United States passed the Victims of Trafficking and Violence Prevention (VTVP) (and amended in 2003) which highlighted the failure of current public policies to "protect victims of trafficking and paradoxically often punish victims more severely than do traffickers." Accordingly, the law stipulates that victims of severe trafficking should not be inappropriately penalized for unlawful acts committed as a result of being trafficked (P.L. 106–386: 103 (9)). The VTVP emphasizes the challenges of existing public policies designed to protect victims of sexual exploitation. The Trafficking Victims Protection Reauthorization Act of 2005 (TVPRA) gives

state and local law enforcement funding to prosecute customers of commercial sex; therefore some law enforcement agencies make no distinction between prostitution and sex trafficking.

The Office on Trafficking in Persons notes that sex trafficking is a modern day form of slavery in which a commercial sex act is induced by force, fraud, or coercion or in which the person induced to perform such an act is under the age of 18 years (US Department of Health and Human Services 2012; Office of Trafficking in Persons). Approximately 300,000 children are at risk of being trafficked in the United States and this staggering number grows daily. According to US State Department (2007), "human trafficking is a multi-dimensional threat. It deprives people of their human rights and freedom, it increases global health risks, and it fuels the growth of organized crime. The sexual exploitation of children has become the third-largest moneymaker for organized crime, right behind guns and drugs."

In the United States, children are more likely to be sexually exploited for monetary gain by family and friends. This unfortunate phenomenon or what some refer to as the cycle of exploitation begins when an adult family member or friend sexually abuses a minor child in his or her care and the abuse escalates to systematic sexual behavior involving multiple children. Moreover, the children being sold, led, or forced into childhood sexual exploitation are experiencing horrific acts of physical and mental abuse as children are being held captive in basements and under other slave-like conditions where they are beaten, malnourished, threatened, and sexually abused.

According to the FBI and the US Department of Justice, human trafficking generates an estimated $9.5 billion in annual revenue in the United States. The US Department of Justice estimates that the average age of entry into prostitution for a child victim in the United States is 13 years old and the average victim may be forced to have sex up to 20 times a day and 100–1,500 clients per year (The A21 campaign: abolishing injustice in the 21st century). Currently, it is estimated that one in five girls and one in ten boys will be sexually exploited before adulthood, while trafficked minors are sold into the sex trade at least 15 times a day (Finkelhor 1994). Sex trafficking is a form of modern day slavery that sexually exploits and prostitutes children for economic gain and has deleterious impacts for girls further perpetuating gender inequality among this population. Slavery in this context oppresses women and girls and prevents the economic, social, political, and moral development of women and society as a whole. Unfortunately, in the United States, children are more likely to be sexually exploited for monetary gain by family and friends.

Girls who are psychologically manipulated and physically coerced by adults into trafficking experience dangerous outcomes. Meaning that exploitative relationships create bond chains that link a victim to someone who is dangerous to them and that include circumstances of incredible intensity when there is an abuse of trust and power. As a result of the mental, physical, and sexual abuse, exploited girls do not self-identify as victims and deny victimization due to fear of further physical and psychological abuse inflicted by the trafficker/pimp, law enforcement, and governmental agencies. The victimization, however, extends beyond the reach of the pimps/recruiters/johns to include public policies/services that should seek to help the young victims but, unfortunately, further victimize the girls subjecting them to arrest, detention, and/or other forms of punishment if caught engaging in prostitution.

## Challenges to Care: The Paradox of Public Policies/Services

The 2013–2017 Federal Strategic Action Plan on services for victims of human trafficking notes that despite the passage of the TVPA and its attempts to create a coordinated victim center approach that more needs to be done to ensure that victims/survivors are able to receive needed services across a broad continuum of public agencies. Moreover, an important consideration of this report is the need to build better relationships with nonprofit and faith-based agencies who in many cases are more experienced with the tools and expertise in meeting the needs of victims. Many of the services needed by victims require both

emergency and long-term care including intensive case management, shelter, medical and dental care, mental health/substance abuse treatment, legal assistance, and educational and employment training services to name a few. The aforementioned provisions of care may be constrained by the state and local laws, state funding, and the coordination of services within the geographic region. As a result, the ability to provide quality coordinated care is often not realized based on the aforementioned constraints. Hence, if public policies have traditionally been designed to alleviate, eradicate, and address social problems and to protect the most vulnerable of society, why is it that so many are failing the vast number of women and children impacted by sex trafficking and exploitation? Moreover, what opportunities could be realized if public services were designed with coordinated comprehensive continuum of care that would create pathways to healing, restoration, and recovery for victims? Given Public Administrators' deference to social justice and equality, it is important that we seek to address the oppression, exploitation, and victimization of one of America's most vulnerable populations, our children.

The needs of girls who have been victimized or at risk of childhood sexual exploitation are great, yet diverse, and create a wealth of opportunities for a cadre of social services and care. Hence, appropriate models of care should focus on collaborations and partnerships among multiple agencies across jurisdictional boundaries. These should include social service providers, law enforcement, health-care professionals, task forces, and coalitions that have been successfully linked to increased access and availability of services among sexually exploited children. The aforementioned challenges can emerge from a lack of understanding the specific needs of sexually exploited victims and seeking to offer services where little or no expertise exists. For example, service providers note that providing services to victims who are living in shelters can be difficult and some environments where providers share examples of sex trafficking clients being placed in domestic violence shelters and then facing humiliation and isolation. One of the most common and frustrating challenges reported by law enforcement and service providers is the lack of knowledge and understanding regarding human trafficking among service providers, law enforcement, and even victims themselves who often do not believe or understand that they are a victim of crime. As a result, victims often go unidentified and unserved.

Although a variety of services exist to assist victims of sexual exploitation, the reality is the majority of victims of childhood sexual exploitation are sent to and held in Youth Detention Centers, where unfortunately they are at risk for further victimization. Although the Detention Center initially provides an opportunity for girls to get off the street, the center is ill equipped to address the developmental, psychological, mental, and physical needs of these girls. The needs of girls who have been victimized or at risk of childhood sexual exploitation are great, yet diverse, and not only create a wealth of opportunities for the faith community but also have implications for the use of appropriate practices of care. Although a variety of services exist to assist victims of sexual exploitation, the reality is that the majority of victims of childhood sexual exploitation are sent and held in the Regional Youth Detention Center, where unfortunately they are at risk for further victimization.

## Conclusion

How can you help? First we can advocate for tougher laws in our individual communities to help eradicate the recruitment and trafficking of children. Organizations such as Street Grace "mobilize community resources – financial, human and material – to help individuals and organizations effectively fighting domestic minor sex trafficking (DMST) through awareness, empowerment and engagement. Street Grace is working to end DMST in Atlanta, with a vision of ending it throughout the United States (www.streetgrace.org)." Street Grace in collaboration with other local nonprofits who work to end the commercial sexual exploitation of children have helped to pass legislation that increases fines and

penalties for those convicted of sex trafficking Street Grace Inc. (2016). GA HB 200 in 2011 provided an expanded definition of "coercion" in the human trafficking statue to include causing or threatening financial harm Georgia General Assembly. GA HB 200. The bill also prohibited defense by blood relation, such as parents exploiting their children, or by marriage, such as a husband selling his wife. Most importantly, GA HB 200 increased fines and penalties for human traffickers who target minors. If the victim is at least 16 but less than 18, the crime is deemed a felony punishable by 5–20 years in prison and fines ranging from $2500 to $10,000. If the victim is less than 16, the years in prison increases to 10–30 and fines up to $100,000. Finally, GA HB 200 requires law enforcement agencies to receive training on how to relate to human trafficking. In 2013, the state of Georgia passed HB 141 that required certain businesses to post notices with information to assist victims of human trafficking to include the toll-free hotline number to the National Human Trafficking Resource Center Georgia General Assembly. GA HB 141. Failure to comply could result in a misdemeanor fine and a penalty of $500 for first offenses and up to $5000 for subsequent violations.

Despite the aforementioned legislation that attempts to curtail the effects of the nearly 400 children trafficked/exploited in Georgia monthly, more can be done. Street Grace is currently working on the national Not Buying It (soon to be "Demand an End") program that provides states with tools and resources to begin awareness campaigns, form an effective task force, and communicate with other state attorneys general regarding legislative, municipal, and corporate best practices to combat demand. Street Grace has also implemented a project that intercepts buyers of online underage sex, educating them and warning them of the consequences of their actions in an attempt to deter future attempts to purchase Street Grace Inc. (2016).

Citizens and community leaders can assist in these endeavors by developing and hosting informational seminars to increase awareness on the pervasiveness of childhood sexual exploitation in the United States and specifically in the state of Georgia, highlighting the aforementioned risk factors. Additionally, we can contact local/state and congressional representatives in an effort to implement tougher public policies that will deter pimps and recruiters from exploiting young girls. Moreover, we can advocate for a more comprehensive coordinated system of care with a vast array of social services to aid in their rehabilitation, such as safe housing, medical care, intensive counseling, court advocacy, mentorship, educational assistance, and job training. Appropriate and responsive services are equally as critical, and this includes a coordinated managed care system of services between law enforcement, social service agencies, and nonprofit agencies to meet the emotional, psychological, physical, and developmental needs of girls. The reality is that very few success stories exist as most victims at first do not view themselves as victims and, as a result, do not seek help.

Secondly, we can become community ambassadors/volunteers with organizations that provide services to girls/women who are victims of sex trafficking and those who work tirelessly to advocate, create awareness, and provide direct services to victims of sex trafficking. We can volunteer with these organizations in developing and facilitating programming for girls in life skills, career readiness, support groups, sporting and recreational activities, and college preparation, to name a few. Your expertise is needed to help to improve the short- and long-term outcomes for victims of sex trafficking. Third and finally, we must help to facilitate a paradigm shift on issues of sex trafficking recognizing that we all can lend a hand. According to US State Department, new cultural norms must be embraced to help aid in eradicating sex trafficking:

> *Rejecting long-held notions such as 'boys will be boys' and sending the clear message that buying sex is wrong is not just a task for governments, but will require partnerships throughout society, including the faith and business communities. Business leaders can adopt codes of conduct that prohibit purchasing sex. And leaders in civil society – from teachers to parents to ministers – must foster the belief that it is everyone's responsibility to do their part to reduce the demand for commercial sex.*

*It is especially important to reach young men with a strong message of demand reduction to help them understand the exploitation that permeates the commercial sex trade.*

# Humanitarian Interventions and Globalization

Damian Grenfell
Centre for Global Research, RMIT University, Melbourne, VIC, Australia

## Synonyms

Global interventions

## Defining Humanitarian-Military Interventions

Globalization is often seen as incorporating two interrelated characteristics; the decreasing dominance of national sovereignty and inversely, the emergence of a global society where people are connected across both local and national communities. The impact of changing forms of technology are understood as stimulating both new and increased levels of trade, exchange, production, membership of groups (religious, political, area of interest), as well as the mobility of people (employment, refugees, migrants, tourists, trafficking).

Digital technologies are seen as central to globalization, allowing people to connect in all kinds of ways irrespective of particular borders and boundaries. That the world is seen as "coming-together" is underpinned by significant changes in how people relate across time and space – a time-space compression as David Harvey phrased it (Harvey 1990) – and a point that will be further developed later in this entry. Globalization is neither inherently positive nor negative. Rather, it is a process that can take on different emphases and trajectories, from the neoliberal free-market economic versions through to those that highlight emancipatory politics, cultural exchange, and the care of others.

Globalization is taken here as being fundamental to understanding social relations between people; namely, how communities and societies are formed and how and why they change, and this

includes how people respond to crises including those caused by human conflict. Where humanitarian aid and emergency or disaster relief focus on providing urgent support to vulnerable people with acute needs, humanitarian interventions (or humanitarian-military interventions) are typically state-led transgressions of sovereignty mobilized via the potential or actual use of military force to protect the human rights of civilians. At the outset here, humanitarian interventions are broadly understood as an attempt at social transformation undertaken by institutions and networks of actors exogenous to a specified site of mass conflict. The immediate aim is typically toward securing peace via a transgression of national sovereignty along with the threat or the actual direct use of military force.

Beyond initial attempts at securing peace, interventions incorporate a fuller gamut of activities over a longer period of time including state-, peace- and nation-building, development and human security, as well as transitional justice processes. These elements interweave in different ways and often carry quite basic assumptions with regard to the form that postconflict society should take, a blueprint often referred to as "liberal peace" where the assumed form for a peaceful society is liberal-democratic and capitalist with a centralized state.

The undertaking of humanitarian interventions, both in an immediate as well as longer-term sense, are informed in different ways by intensifying processes of globalization and shifts in the ways that state-sovereignty has come to be considered in recent decades. Once viewed as largely sacrosanct, national sovereignty is now seen as something less inviolable, and its transgression is argued for in exceptional cases where humanitarian crises are occurring (Weiss 2009). In effect, this may mean that interventions occur irrespective of the wishes of a national government (for instance Libya), or with significant pressure on a particular government to give sanction to a humanitarian intervention from external forces (such as Indonesia's occupation of East Timor).

This conditional view of sovereignty has most clearly gained traction with the Right to Protect doctrine (R2P). Developed and propagated by a range of international networks, think tanks, United Nation's (UN) agencies, and academia, R2P sets out the criteria framing the conduct of interventions, including that they be undertaken by the right authority (such as the UN), the right intention (for humanitarian ends not political interest) as a last resort (where all other diplomatic and political options have been exhausted), where reasonable prospects exist (that an intervention will improve the situation) and with proportionate means (that the intervention uses military force proportionally to the objectives of securing people's human rights) (A/57/303, 2002). Each of these codifies and regulates both the decision to and mode of intervention into a conflict irrespective of state sovereignty.

While increased interest in R2P is one indicator of a different approach to national sovereignty where humanitarian crises occur, its application in practice has been both limited and critiqued. While the intervention in Libya was partly justified in terms of R2P, the disproportionate use of force by NATO has been criticized where the "assistance to the rebels significantly extended the war and magnified the harm to civilians, contrary to the intent of the UN authorization" (Kuperman 2013, p. 14). In the reverse, the humanitarian disaster in Syria, due to the regional war that began in protests against Syrian leadership in 2011, has led to separate military interventions by a range of nations including Russia and the United States (US), but the objective has been military victory rather than securing humanitarian outcomes. As discussed in the following sections, conflict and humanitarian interventions have been significantly shaped in a more immediate sense by the end of the Cold War and more generally by the intensifying processes of globalization.

## The End of the Cold War and the Illiberalism of Global Conflicts

While humanitarian interventions occurred before the collapse of the Soviet Union in 1991, the breakup of the Soviet Republic and subsequent end of superpower rivalry of the Cold-War period led to a significant increase in the number of

humanitarian military interventions. From the end of World War Two to the early 1990s, humanitarian efforts had been constrained by the rivalry between capitalist and communist blocs – East and West – where attempts to intervene into conflicts were deemed by either side as a threat to their interests (Paris 2004). Peace efforts were regularly vetoed in the UN Security Council, the horrific ramifications of which identified by former UN Secretary General Boutros Boutros-Ghali.

> Since the creation of the United Nations in 1945, over 100 major conflicts around the world have left some 20 million dead. The United Nations was rendered powerless to deal with many of these crises because of the vetoes – 279 of them – cast in the Security Council, which were a vivid expression of the divisions of that period. (Boutros-Ghali 1992, p. 3)

The end of the Cold War meant instead a great deal more political space for mobilizing large-scale interventions into conflicts without the risk of superpower conflict. Moreover, there were resources that could be directed into these conflicts especially as they became increasingly seen as a risk to regional stability and trade interests. The most well-known humanitarian interventions since the end of the Cold War have included those in Somalia (UNOSOM I 1992–93; UNOSOM II 1993–95), Haiti (UNMIH 1994–95), Bosnia and Herzegovina (UNMIBH 1995–2002), Liberia (UNOMIL 1993–97), Sierra Leone (UNOMSIL 1998–99; UNAMSIL 1999–2005), East Timor (UNTAET 1999–2002), Kosovo (Operation Allied Force/UNMIK 1999–), and Libya (2011).

Where large-scale humanitarian interventions were concentrated in the 1990s and the early years of the new millennium (Libya in 2011 being an exception), many peacekeeping operations, long-term reconstruction, and development efforts continue, albeit with less global attention. Roland Paris (2004) is frequently cited for showing the sharp upswing in peace efforts where "from 1989 to 1999, the UN deployed thirty-three peace operations, more than double the fifteen missions that the organization conducted in the four preceding decades" (p. 17). From 1999 to 2014, there have been 20 UN peacekeeping missions (Figure taken from UN Department of Peace-Keeping Operation's (DPKO) list of operations. Available via: http://www.un.org/en/peacekeeping/documents/operationslist.pdf), and in 2015 there were 16 active operations comprising a total of 106,245 uniformed personnel, 16,791 civilian personnel with an annual budget of approximately USD 8.27 billion (Figure taken from UN DPKO Fact sheet, last updated August 31, 2015. Available via: http://www.un.org/en/peacekeeping/resources/statistics/factsheet.shtml).

With commentators such as Francis Fukuyama (1992) taking the demise of the Soviet Union as a "liberal revolution" that constituted the culmination of a "universal history of mankind in the direction of liberal democracy" (p. 48). The terms "bipolarity," "balance of power," and "mutually assured destruction," all part of the Cold War security lexicon, became increasingly residual concepts as various forms of liberalism permeated the ideological landscape. One expression of this liberalism was the increase in interventions, with the belief that violence, even the worst most intractable kinds, could be overcome and peace secured.

In contrast to the dominance of liberal beliefs within key international institutions, these interventions were undertaken into conflicts that were seen as both deeply violent and complex. Often following the fissures created by colonial state-building – where borders had been forged according to European interests rather in the aftermath of the Cold-war than those of the colonized – political regimes could no longer rely on the protection of either the USA or the Soviet Union. Contestation to existing regimes grew within nations, and so while violence between states appeared to regress, there was an acceleration of violence from within societies; a move from the interstate to the intrastate as people tried to remake the order of things around them in a rapidly changing world. At times, these wars have been for secession (Tamils unsuccessfully in Sri Lanka; South Sudan, Timor-Leste, and the break-up of former Yugoslavia all resulted in new nations), while other conflicts have been between groups competing to control resources or attempting to

redefine a polity (for instance Sierra Leone, Rwanda, Haiti, Libya).

This wave of conflicts were often presented as "new wars," and according to authors such as Mary Kaldor, they presented a qualitatively distinct form of conflict, made distinct by information and technology as well as in their form and motives (Kaldor 2001). Kaldor sees this contemporary warfare as differentiated by its decentralized organization and integration into a "global" war economy rather than being based on "vertically organized hierarchical units," whereby the rise of identity politics emanated from "established political classes" and the threats posed to them by globalization (2001, pp. 8–9). Maintaining legitimacy – and the appearance of sovereign control – relies more and more on the manipulation of political culture and the ability to mobilize people based on prejudices. This politics, she argues, "tends to be fragmentative, backward-looking and exclusive", based on nostalgia, and "the construction of the heroic past, the memory of injustice, real or imagined, and of famous battle, won or lost" (Kaldor 2001, p. 78).

In contrast to conventional warfare, understood as made up of hierarchically organized and clearly delineated armed forces distinct from civilian populations, new wars are marked by multiple groups, identity politics, and fluidity between military and nonmilitary actors. Moreover, many of these contemporary conflicts are reshaped by access to small arms that circulate the globe, ordered and transported through abstracted exchange mechanisms and logistical supply chains. People may still be killed in warfare by guns and bullets, but the contours of violence are shaped both politically and militarily by engagement with and responses to globalizing practices.

## Global Humanitarian Interventions

Where shifting patterns of violence in the post-Cold War world were shaped in different ways by globalization, so too have efforts toward humanitarian responses, including the large-scale peace here. To understand this, it is important to briefly return to the discussion of globalization conceptually. A "global community," a "global consciousness," or of a "world coming together" are phrases that are underpinned by deep changes in where and how people see themselves and how they connect to others. Technology is a central element in understanding globalization, though it does not exist independent of social context. In other words, with humanitarian interventions (along with innumerable other points of possible analytical consideration), it is not just the availability of technology that is important, but the why and the how it is used.

New technologies – information, digital, market, military, transportation – have been utilized to an extent where people are becoming increasingly disembodied and integrated across global-time and global-space. This means that people are seeing themselves increasingly connected across territorially boundaries – "from anywhere to anywhere" – and that there is a simultaneity to the extent that the sense of time gap between people is reduced to a singular and instantaneous moment. Things happen with a greater sense of immediacy, both in terms of what we know is happening around the world (for instance, watching tsunami's hit Japan live on televisions around the world) as well as how we connect with unknown others (the donation of funds to those in need for instance). Anthony Glidden's, one of the first thinkers to analyze the role of time and space in terms globalization, draws attention to the acute change across societies.

> In the modern era, the level of time-space distanciation is much higher than in any previous period, and the relations between local and distant social forms and events become correspondingly "stretched". Globalization refers essentially to that stretching process, in so far as the modes of connection between different social contexts or regions become networked across the earth's surface as a whole. (Giddens 1990, p. 64)

Across earlier periods of modernity, the nation was the dominant political community formed around a bounded space (territory) and time (history). Under conditions of intensifying globalization however the intersection between space and time begins to alter where there is an intensifying incidence of temporal simultaneity globally

alongside a deterritorialization of social relations spatially per se (the 'per se' here is important, as typically it is the nation-state that globalization is written as if in oppositional form, whereas it is in effect the deterritorialisation of social relations across all forms of territory, including for instance the home and the workplace). In other words, people are drawn progressively into relations with one another that are not just regulated by a world time (as nations are), but for whom a sense of temporal coincidence with known and unknown others emerges, irrespective of how or where one is located.

These more conceptual elements of globalization are manifested in very ready ways in how humanitarian interventions are undertaken. Perhaps the most obvious way is in how flows in information can lead to increased political pressure "to do something" in nations far from sites of actual violence. Action from war zones, like natural disasters, can be watched live as frontline journalists or the combatants themselves televise the horrors before them. What may have once been virtually unknown events gain significant global attention and demands for action (such as the kidnapping of girls in Northern Niger by Boko Haram). The image of a dead Syrian boy floating in the shallows of the Mediterranean in 2015 is a case in point, even if it moved opinion toward the acceptance of refugees rather a military-humanitarian intervention in Syria. Equally, media imagery can shape domestic responses both for and against interventions; pro-intervention in the USA in terms of Haiti, and particularly in Australia and Portugal in the case of East Timor, or in opposition to interventions, most famously the US domestic reaction to the treatment of its soldiers killed in Somalia in 1993. The flow of information, and a flattening out of the time between something occurring in one place and others learning about it in another, in combination with the increased mobility of technology, has meant that it has become almost impossible to control the flow of information and in turn the political effects that it may have.

Similarly, global processes have shaped the ability to coordinate military efforts undertaken in the name of humanitarian interventions. The targeting of sites as well as the coordination of NATO member air forces in Kosovo relied on the transmission of information via satellite systems. In Libya, even the tracking of Colonel Muammar Gaddafi up until the time he was executed occurred via NATO-controlled communication systems (Adams 2012, p. 14). No fly zones, and humanitarian delivery equally, rely on complex layers of communication, exchange, management, and the production of goods that are organized by networks that cut across sovereign terrains and connected across decentered supply chains (arms industry, logistical supplies to the military, and so forth).

The increased number of interventions post-Cold War discussed above has been matched by their increased size, ambition, and complexity. Reflecting this was the growth between 1988 and 2008 where the number of troop-contributing countries increased from 26 to 121, the numbers of military and police personnel grew nearly tenfold, and the annual UN peacekeeping budget rose from 2.3 billion to 7.4 billion dollars (Ramsbotham et al. 2011). These interventions comprised networks of organizations including those of the "UN Family" (UNDP, UNHCR, UNICEF, UNIFEM, and so on), as well as an enormous number of aid agencies and non-governmental organizations.

The complexity of their composition can, at least in part, be understood in terms of the impact of globalization on the organizational and managerial operations of the wide number of institutions and networks. While from a distance interventions may appear singular and coherent as "UN Sanctioned" and "NATO enforced," on the ground they are typically made up of a vast array of organizations; militaries from different nations, private security firms, logistic companies, civil society organizations – from local community-based organizations through to the large global efforts of Oxfam, Red Cross, and so forth – as well as local and national leaderships, movements, political groupings, businesses which are all situated in a wide range of (and at times competing) mandates, legal frameworks, regulatory domains, local laws, and different kinds of conventions.

The ability to draw together such complex arrays of organizations into something that resembles a coalition, or towards an agreed objective, relies deeply on technologies that have increased the reach, mobility, and speed in which such operations have been able to occur. Not only does an organization such as Oxfam rely on integrating financial, logistical, and programmatic expertise and management via information technologies in order to mobilize for humanitarian need – financial in order to shift money, social media to stimulate public interest, management systems to mobilize human resources and expertise, communications to report events and program outcomes, that things increasingly occur in "real time," meaning a simultaneity in decision-making, deployments, the allocation of resources, irrespective of the actual location of those involved in making the decisions.

One of the effects of this level of integration is that spatial distinctions between the local and the global become blurred. Nongovernmental organizations deal with the most intimate problems of everyday life while also becoming key intermediaries in the deployment of national and international humanitarian aid. Regional organizations are frequently drawn in multiple directions; toward the site of intervention where they can claim legitimacy due to proximity and political connections while mandated by international organizations and resourced through transnational and global supply chains. This leads to complex intersections across what might have once more easily been defined as local, national, regional, and global concentrations of power into a far more diffuse and complex field. It is now increasingly difficult to clearly differentiate practices according to scale as organizations are simultaneously drawn out to both the most abstracted and inwards toward the most local levels, demonstrating how under intensifying the processes of globalization how space becomes increasingly "compressed" to borrow from Harvey's phrase.

## Conclusion

War and efforts at peace have long drawn people into contact with one another from across the world. Violence, in this sense, has been both destructive but also the source of connecting people, whether they be soldiers from one continent recruited for war-fighting in another, or for NGO workers, or peace-keepers, working in order to deliver humanitarian need. What may appear very similar on the ground however, for instance both killing and its prevention via intervention, is being reshaped by globalizing processes to such an extent that it is changing the nature in which humanitarian action occurs. The "space" and "time" distance between event and response, between empathy and action, and between atrocity and intervention, is being compressed as social relations across the globe become reconstituted within a globalizing framework of relations. This does not mean that all human rights abuses, let alone the worse, are acted on. What this does mean is that when they are acted on, this occurs in a way where there is a greater ability to organize and coordinate efforts across far more disperse sets of actors, across a flattening of time, reshaping how humanitarian interventions occur in an age of deepening globalization.

## Synonyms

Digital governance; Digitalization; E-democracy; E-government

## Definition

ICT tools: Information and communication technology tools applied to develop and promote government both internally in the administrative apparatus and targeting citizens and users.

## Introduction

This entry chapter addresses the use of ICT tools in central government (see Christensen and Lægreid 2020a). Limited attention has been paid to empirical analyses of the institutional and organizational aspects of use of ICT tools in central government and how it affects collaboration and coordination relations within government and with external stakeholders (Randma-Liiv and Vooglaid 2020). There is little systematic insight about how public administrators themselves are defining digital transformation in their own day to day and what their expected outcomes are (Mergel 2018).

This gap is addressed in four ways. First, in contrast to the focus on the demand side of e-participation that has dominated this field, the focus is on a state-centric approach and addresses the supply side as seen by civil servants in central government. Second is by empirically examining both the internal (government-to-government) and external (government-to-citizen) challenges of digital governance (Chen 2017). Third is by treating digitalization both as a dependent variable, explaining the variation in use of different ICT tools, and as an independent variable focusing on the impact of the use of digitalization tools on coordination in central government. Fourth is by applying mainstream organization theory approaches to a research question that has mostly been studied through other lenses.

The aim is to contribute to the knowledge about how administrative systems, institutional structures, and cultures constrain and enable the digital-era governance trajectory (Nograsek and Vintar 2014). It aims to answer three research questions:

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

- First, what characterizes the use and scope of different ICT tools in central government related to e-government (government-to-government tools) and e-democracy (government-to-citizens tools)?
- Second, what can explain variation in the use of ICT tools? Structural features such as tasks, administrative level and position, and/or cultural features, such as identity, conflicts, and trust relations?
- Third, what are the effects of using the various ICT tools on perceived coordination quality along different dimensions (external-internal, vertical-horizontal) in relation to structural and cultural factors?

The argument is that one can apply a general analytical framework to understand the scope, predictors, and effects of ICT tools (Hood 2006). Barriers and challenges to e-government can be organizational and cultural (Snellen 2005). To explain the variations in the use of ICT tools and the effects of ICT use on coordination quality, structural and cultural perspectives have been used (Chen and Lee 2018). A *structural perspective* includes variables like different organizational forms, formal position, and tasks, while a *cultural perspective* adds features such as trust, identity, and conflict (Christensen et al. 2020).

Public managers and executives are the enactors of ICT technology in central government, and the focus is on these civil servants and their use and perceptions of ICT tools, distinguishing between government-to-government and government-to-citizens tools.

## Data Base

The empirical data are based on a survey of Norwegian civil servants in central government offices at executive officer level and above conducted in 2016. A total of 2322 employees in the ministries and 1931 in the central agencies answered the survey. The response rate was 60% in the ministries and 59% in the central agencies.

*Regarding the scope and intensity of ICT tool use*, the respondents were asked *To what degree are the following ICT tools used in your daily work?*

- ICT-based reporting systems for documentation of results/activities
- ICT-based tools for information sharing and coordination across ministerial areas or administrative levels
- ICT-based tools for information sharing and coordination within own ministerial area
- Electronic debate forum (e.g., Facebook, Twitter, LinkedIn)
- Electronic hearings

The three first tools are government-to-government tools, while the two last are government-to-citizens tools.

*Regarding coordination quality* the following question was asked: *How would you characterize coordination within your field of work along the following dimensions?*

(a) Coordination between different government authorities within your own ministerial area
(b) Coordination with government actors in other sectors
(c) Coordination with regional and local government
(d) Coordination with supranational or international organizations
(e) Coordination with the private sector/civil society

The *structural variables* include administrative level, hierarchical position, coordination tasks, information/communication tasks, and transboundary tasks. Regarding administrative level, it is distinguished between ministries and central agencies. The tasks concern whether the task is a main task or not.

The *cultural variables* include identification with central government, level of conflict, and mutual trust relations. *Identification* is whether civil servants rate their own affiliation and identification with the central government administration in general as strong or weak. The *level of conflict* is about whether civil servants assess their own field of work as characterized by a

high or low degree of agreement. *Mutual trust* is the perceived mutual trust between the ministries and agencies as good or poor.

## Use and Scope of ICT Tools

Government-to-government tools are more frequently used in central government than government-to-citizens tools (see also Christensen and Lægreid 2010). More than half of the respondents report that ICT-based tools for information sharing within own policy area, across policy areas or administrative levels, or ICT-based reporting systems for documentation of results and activities are used to a great extent in their daily work. In contrast, few use electronic hearings and social media. Thus, ICT tools are used primarily for collaboration within central government with a rather limited role for nonstate actors. There is a significant overlap between the use of the different ICT tools.

The overall scope of use of these different ICT tools reveals that about one fifth of the civil servants do not use any of the five listed ICT tools to a great extent or more in their daily work, while 35% use three or more. One fourth of the civil servants do not use government-to-government tools to a great extent in their daily work, while almost 50% use two or all three of the listed tools. Two out of three do not use government-to-citizens tools.

## Predictors of ICT Use

Structural features are main predictors for use of ICT tools. Administrative level and position matter to a great extent. ICT tools are used more in ministries than in central agencies and more among managers and leaders than among executive officers. This applies both overall and to government-to-government and government-to-citizens tools, respectively. Generally, there are more similarities than differences between government-to-government tools and government-to-citizens tools.

The difference between ministries and central agencies is especially great for government-to-government tools. Civil servants who have information and communication as a main task tend to use government-to-citizens tools more frequently than other civil servants. The same goes for those who have many transboundary tasks. Cultural features matter to some extent. If the civil servants identify strongly with central government as a whole, they also tend to use various ICT tools more extensively. On the other hand, mutual trust relations and level of conflict do not seem to affect use of ICT tools.

## Perceived Effects of ICT Tools on Coordination Quality

Use of ICT tools in general has a positive effect on perceived coordination quality along all five dimensions studied. This confirms the findings of previous studies that ICT tools have enhanced coordination and cooperation in public administration (Danziger and Andersen (2002) and have a positive effect on perceived coordination among Norwegian civil servants (Christensen and Lægreid 2010). This applies both to GtoG tools and GtoC tools, but it is especially the case for GtoG tools. The effects of GtoC tools are significant regarding internal coordination within own policy area on coordination quality and vis-à-vis civil society and the private sector.

Second, structural features also matter. Administrative level in particular has a significant impact. Civil servants in ministries perceive better coordination quality than those working in central agencies. Further, task matters, because civil servants who work with tasks requiring collaboration across administrative levels and policy areas generally see coordination quality internal in own policy area, across policy areas, and with the civil society as better.

Third, there are also several significant effects of cultural features. Low level of conflict, high level of identification with central government as a whole, and high level of mutual trust between ministries and central agencies tend to enhance perceived coordination quality along all dimensions.

## Discussion: Revisiting the Explanatory Perspectives

*Variations in ICT scope.* First, most of the structural variables show that civil servants in the ministries, in high positions, and involved in transboundary tasks and information and communication tasks score highest on the use of ICT tools. Formal structures channel actors' perceptions and actions to a great extent (Egeberg and Trondal 2018). There is a close relationship between use of ICT tools and structural features (Fountain 2001), which might reflect that use of such tools is more or less mandatory or necessary for civil servants in specific positions and with specific tasks. There seems to be no big differentiation between the use of GtoG and GtoC tools.

Second, the cultural perspective unexpectedly reveals rather few effects of cultural variables on use of ICT tools. The only one is that civil servants identifying more broadly with central government use more ICT tools, meaning simply that a broad orientation leads to a broad communication pattern, that is, the more specialized features of their roles are of less importance. Summing up, different structural settings in which the civil servants work influence the use of ICT tools, but also organizational culture has some focusing impact on how ICT measures are adapted (Meijer 2015).

*Variations in perceived coordination.* Moving on to the effect side, ICT use is analyzed concerning its effect on perceived coordination quality. First, the GtoG tools have both overall and differentiated effects. They seem to enhance interorganizational coordination and integration both vertically and horizontally (Gil-Garcia 2013; Dunleavy et al. 2006; Torfing et al. 2020).

The effect of the GtoC tools on coordination quality is overall weaker, but it has a significant effect on coordination quality with the private sector and civil society. There is also some effect on coordination quality within own policy area, which could be related to the fact that the administrative apparatus requires a consistent set of signals and interaction premises. Overall, the governmental ICT tools do not score high on societal involvement indicating that it is a thin form of participation (Torfing et al. 2020).

Second, the effects of the other structural variables on perceived coordination quality are weaker. Civil servants working in ministries seem to perceive more effects internally in own policy area, across policy areas, and with supranational bodies than civil servants in central agencies, which is in line with their overall more intense use of ICT tools, that is, intense use makes the perception of positive effects more likely (Christensen and Lægreid 2020b).

Third, concerning cultural factors, there are some major expected effects, probably meaning that informal trust factors play a major role in government communication. High mutual trust relations between ministry and subordinate agencies lead in all five coordination dimensions to a more positive perception of coordination quality with high significant values, meaning that the predisposition and mind-set of these actors is more geared toward coordination. Also, identification with central government has a significant positive effect on coordination. Low level of conflicts seems to enhance perception of coordination quality, that is, there are fewer barriers to communication, because of shared norms and values (Christensen and Lægreid 2020b).

Summing up, use of ICT tools has an impact on perceived coordination capacity, but they seems to supplement structural and cultural factors more than replacing them (Coursey and Norris 2008).

## Conclusion

Revisiting the research questions, the conclusion is that ICT tools are widespread in central government organizations but also that internal government-to-government tools are used more than external interactive government-to-citizens tools. The predictors of ICT use in central government are primarily structural. The use of ICT tools has a significant effect on perceived quality of coordination, but more so for GtoG tools than for GtoC tools. But structural and cultural features also matter for perceived coordination quality.

Thus, the use and impact of ICT tools in central government seems to be a result of organizational adaptation at the interface between modern technology and established organizational forms and culture (Mergel 2018). The perceived impact of ICT tools has to be seen in a cultural and structural context and is both constrained and enabled by the structural and cultural context in which they are used, not indicating any technological determinism (Christensen and Lægreid 2010) supporting the view that digital area governance coexists with other public governance paradigms (Torfing et al. 2020).

In conclusion, this study supports the social shaping of technology perspective (Homburg 2008). The use and impact of ICT are embedded in the existing structural and cultural context in public administration. The organization of public administration is an important determinant for the use of ICT initiatives as civil servants often initiate, moderate, implement, and evaluate ICT means and measures inside a certain structural context (Randma-Liiv and Vooglaid 2020). There are similarities between the ideas of "dynamic conservatism" regarding the use and perceived effects of ICT tools and an approach that utilizes a combination of flexibility and robustness. ICT tools have changed public organizations but the gains from using the new technology have been incremental. The increasing importance of digitalization in public administration is acknowledged, but this is just one aspect of the current public sector reforms and not necessarily the key driver for transforming public governance (Pollitt and Bouckaert 2017).

# Identity Politics in Uganda

Pius Gumisiriza
School of Public Policy and Governance,
Uganda Management Institute, Kampala, Uganda

## Synonyms

Colonialism; Ethnicity; Identity; Identity politics; Politics; Race; Religion; Uganda

## Definitions

Identity politics is a very slippery term that has been used to describe different sorts of things over time (see Brunt 1989). In this entry, identity politics is defined as the use of self-defining psychocultural constructs that give meaning to people's life such as race, religion, and ethnicity to acquire and exercise political power in Uganda (see Bernstein 2005). Uganda is an East African country, was colonized by the British, and got independence in 1962. The country has around 40 million people with a mixture of religions and ethnicities. From the time of it's founding as a country in 1890 to present time, identities such as race, religion, and ethnicity have been politicized to achieve political and economic advantage in Uganda.

## Introduction

The main narrative pursued in this discussion is that while colonialism significantly contributed toward the creation of confrontational identity politics in Uganda, post-independence leaders and governments have also been complicit in fomenting and exploiting identity politics largely for selfish or narrow benefits. Therefore the blame for Uganda's continued identity politics cannot be solely placed on colonialism as colonialism and ideological bankrupt leaders as President Museveni has been singing for the last 30 years because he has been a key perpetuator of the same over the same period. The entry is structured in four major parts: the colonial period (1894–1962), Obote I regime (1962–1971), Idi Amin regime (1971–1979), Obote II regime (1980–85), and Museveni regime (1986–present). Colonialism significantly contributed toward the creation of confrontational identity politics, and instead of post-independence leaders uprooting it, they implicitly fomented identity politics for selfish interests. Therefore the blame of postcolonial Uganda cannot be solely placed on colonialism.

## Identity Politics During the Colonial Era 1894–1962

Before the British configured and named the territory we now know as Uganda, it was a heterogeneous area with an array of feudalistic centralized kingdoms and non-stratified communities with different ethnic groups that conflicted on many issues especially land, cattle, marriage, and trade (see Adhola 2013). The overriding objective of colonialism was exploitation of colonized places for the benefit of the metropolitan country. In Uganda, exerting colonialism on the territory, exploiting its resources, and controlling the population were achieved using different methods including politicizing the population along racial, ethnic, and religious lines. Legally, the colonial state introduced laws that governed people according to race (civil law) and tribes (customary laws). Races that were different in culture, language, and interests were made to live together and forge a common future, while tribes that shared communities, languages, and even culture were made to live separately purposely to prevent them from forging a common destiny (Mamdani 2013). Economically, British colonialists created a three-tier society along racial lines with Europeans at the top, Asians in the middle, and Africans at the bottom. They

systematically undermined African participation in trade and industry while encouraging European and Asian participation. Asians became involved in retail trade, wholesale trade, cotton ginning, and coffee and sugar processing, and by the late 1940s, all the banks were British- or Indian-owned. Africans were rarely lent money by banks, and licenses for wholesale trade according to colonial policy could only be issued to traders who owned permanent buildings of stone or concrete, and this largely excluded Africans. In 1959, Africans handled less than 10% of national trade. This colonial economic structure concentrated substantial incomes largely in the hands of non-Africans resulting in a wide imbalance of wealth and power within Uganda (Ramchandani 1973). Regionally, the colonial state zoned Uganda in ways that created regional inequality and fomented tension. Cash crops, education facilities, railroad transport, native administrative jobs, production, and wealth were effectively concentrated in the South, while the North was used as a reservoir for labor and armed forces. In 1925 when the new Director for Agriculture started to encourage cotton production in the North, he was summarily advised that the policy of government at that time was to refrain from actively stimulating the production of cotton or other economic crops in outlying districts on which it is dependent for a supply of labor for carrying out of essential services in the central producing districts (Apter 1997). Politically and administratively, natives and their institutions were excluded from government and considered too backward to contribute much to the development of the country. All executive powers were invested in the British Commissioner, and all the legislative councilors were Europeans. In 1926 one Indian was appointed as an unofficial member purposely to appease the Indian community and coordinate the interests of European and Indian commercial groups. Indirect rule was used to administer the native population, and throughout the colonial period from 1890 to 1962, Buganda enjoyed a privileged status because of its collaboration in the colonial conquest of other parts of Uganda specifically Bunyoro and Busoga. Buganda Kingdom's centralized system together with British-supported Baganda chiefs were superimposed onto other regions which exacerbated tensions within different communities as revolts against Baganda rule became common throughout Uganda but more particularly in Bunyoro and Busoga. The British colonialists rewarded Buganda with two Bunyoro counties of Buyaga and Bugangaizi for helping to conquer the latter. In 1945 when natives could hold a high office in the Native Governments and Administrations, it was again only Buganda, the Western region, and Eastern provinces that were to be represented. The Northern region was denied involvement on the claim that their tribal and administrative organizations had not yet advanced to the stage requiring the creation of centralized native executives (Kanyeihamba 2002). Religiously, the British colonial state favored Protestants especially in education and employment, yet Catholics were the majority and regarded Muslims as third-class citizens. This was reproduced with devastating consequences in the formation of the two major parties, namely, the Uganda People's Congress (UPC) mainly associated with Protestantism and the Democratic Party (DP) widely seen as a Catholics' party.

## Independence Constitution and Political Party Formation

The Independence Constitution negotiated in London a few months prior to independence failed to solve the question of Bunyoro lost counties and failed to redistribute power among smaller ethnic communities. Instead Buganda maintained its overwhelming power and was granted full federal status in an attempt to appease its separatist tendencies and a semi-federal relationship to the other kingdoms. These concessions not only made Buganda complacently arrogant toward other regions, but they also contributed to the emergence of competing nationalisms in Uganda. There were Uganda-wide nationalism that aimed to serve the country as a whole, the Kiganda nationalism that aimed to serve the interests of Buganda, and anti-Kiganda nationalism

that primarily aimed to serve the interests of all other ethnic groups in Uganda (Kiwanuka 1970). These kinds of nationalisms and resentful attitude made ethnic identity a central pillar in political party formation. Each party also perceived their struggles in the context of advancing the interests of the regional communities and constituencies from which they commanded support. The Democratic Party (DP) and Kabaka Yekka (KY) were predominantly Buganda (identified with the Southern constituency), and the KY pursued a federalist line to advance the interests of Buganda. The Uganda People's Congress (UPC) was at its core an anti-Buganda party and was predominantly composed of people from the North mainly Lango and Acholi. Within the north there existed two sub-constituencies, namely: the Acholi-Langi as identified with Obote and the Lugbara-Kakwa-Anyanya as identified with Idi Amin. Within the UPC, there were also people from the south especially Ankole headed by Grace Ibingira who competed for its top leadership pursuing conservative social policies, while the Nilotic group pursued more radical social policies (Mutibwa 1992; Aidan 2011). UPC had very divergent political goals, contradictory ethnic bases, conflicting ideology, and divergent views on almost every conceivable subject with the KY, but their ugly marriage of convenience led to the defeat of DP in the 1962 elections, and they led Uganda to independence led by Prime Minister Milton Obote of the UPC.

## Identity Politics Under Milton Obote I Regime 1962–1971

The unlikely marriage between the KY-UPC came to a bitter end within 2 years after independence when Prime Minister Milton Obote who hailed from the north of the country did his utmost to ensure that the ethnic power of Buganda was reversed. The turning point came only a day after the termination of the UPC-KY alliance on August 25, 1964, when a bill was introduced for a referendum to be held on the question of the lost counties of Bunyoro. Buganda authorities were unwilling to cede control, but when the vote took place, the residents of Buyaga and Bugangazzi voted overwhelmingly to retain their traditional attachment to Bunyoro. This ethnically defined defeat was extremely embarrassing for Kabaka Edward Muteesa II (King of Buganda Kingdom and nonexecutive president of Uganda at the time) who took the view that far from uniting the country, the referendum had decisively split Uganda (Muteesa II 1967; Ingham 1994). The lost counties debacle acted as a precursor for Obote's final showdown with the Kabaka in 1966. On May 24, 1966, troops from the central government, led by Idi Amin, attacked the Kabaka's palace whose lieutenants put up a stiff resistance but were no match for Amin's troops. Muteesa escaped and eventually thought asylum in London where he died. The Kabaka could do little to reverse the severe blow that had been inflicted on the prestige of the kingdom, and high-ranking Baganda also interpreted the referendum as a demonstration of their inability to control their own destiny in an independent Uganda. Meanwhile as the Baganda were agonizing over the course of events, there was little indication that the rest of the country was unduly disturbed by these events (Ingham 1994). In fact Ugandan political actors outside Buganda believed that by terminating Buganda's special political and constitutional status that reduced it to a position of virtual irrelevance, a historic wrong had been set right (Mudoola 1996). Much as Obote had successfully redistributed power away from Buganda, his campaign for national unity was hypocritical as chose to replace Buganda's hegemony with ethnic groups from the north of Uganda where he came from. Obote kept preaching about the death of ethno-politics while at the same time he was heavily recruiting reliable northern-based ethnicities into the army and excluded ethnic factions that he deemed unreliable. He created a number of armed organizations in an attempt to rival the regular army, namely, the Special Force and the General Service Unit (GSU) controlled by his cousin Akena Adoko in a common cause for survival against the rest. The Special Force and the GSU were filled with individuals from Obote's own

district of Lango and were favored in terms of arms, equipment, and budgetary allowance that greatly angered the regular army (Lofchie 1972). Obote was clearly trying to exploit the ethnic composition of the army and pinned his hopes on the alliance between the Langi and Acholi, whom he had strategically positioned in important positions. He made this a very fatal error of combining his political stratagem with an ethnicized military force after realizing that his stay in power could not be guaranteed (Mudoola 1996). Obote's strategy was extremely divisive within the armed forces, and it helped people like Idi Amin who was senior army officer to mobilize his own ethnic affiliates from West Nile to counterbalance the inflated numbers of Langi and Acholi in the army. In an attempt to weaken the West Nile group within the army that Amin represented, Obote promoted Amin to the position of Major General which was of greater honor but of much less influence in April 1968 (Hansen 1977). In response, Amin began recruiting heavily from his own language cluster, which saw a sudden rise of Sudanic speakers in the army and a corresponding decrease of Nilo-Hamitic speakers. Amin also managed to generate popularity in Buganda where people were still resolute in their hatred of Obote because of the events from 1964 to 1966 as earlier discussed. Amin came to represent Buganda's opposition to the regime and thereby brought about a coalition between his group in the army and the civilian groups in Buganda opposed to Obote. When the decisive hour came in 1971, Amin relied on his loyal supporters from his tribe whom he had equipped properly. Obote was abandoned by his Acholi allies in the army who were disgruntled by the government's response to the murder of Brigadier Pierino Okaya an Acholi whose assassination they blamed on Amin. Obote dug his political grave by using ethnicity to contain ethnicity (Glentworth and Hancock 1973). Obote's downfall was directly sparked by his idealism of correcting colonial injustices when he announced on January 5, 1969, during a commonwealth leaders' conference in London that it was ultimately wrong for all the vital aspect of the economy to be controlled by foreigners and that around 40,000 Asians who held British passports would have to leave Uganda. In early 1970 Obote followed up on his 1969 declarations in London and resolved that all Asians holding British passports should leave Uganda (Ingham 1994). In 1971, while attending another commonwealth leaders conference in Singapore, Idi Amin overthrew Obote in a coup d'état that was quickly welcomed and supported by western governments especially the United Kingdom and United States and it has seen been revealed that they were actually behind that coup.

## Identity Politics Under Idi Amin's Regime 1971–1979

Amin publicly highlighted a list of 18 grievances that he used as a justification for the January 25, 1971, coup. The list included the breakdown of law and order, neglecting the armed forces in favor of the GSU and ethnic manipulation of the army and country as a whole. The list of grievances seems somewhat ironic given that Amin was heavily involved in the ethnic manipulation of the armed forces before 1971 and also the fact that he continued the policies of Obote by perpetuating the importance of the ethnic factor in all his schemes to maintain power. Unsurprisingly, the overthrow of Obote still maintained power in the north of the country, though to a new and more narrowly defined group in order to break with the inherited ethnic group structure, but also quickly showed distinct continuity with the Obote regime. Amin brought the army under his personal control and changed its ethnic composition by recruiting and promoting more officers from his region of West Nile in northwest Uganda. He liquidated the Special Force and GSU filled with pro-Obote Langi, seriously meted revenge on the Acholi and Langi people whom he accused of continued support to Obote who had established training camps and engaged in various cross-border guerrilla attacks from Tanzania where he had fled. Shortly after the coup Amin announced that an airport, giant hotel and university were to be built in his home district West Nile, which confirmed the continuation of the already

familiar pattern of ethnic favoritism (Hansen 1977). Given the resentment the Asians attracted from the lower echelons of Ugandan society, the steps that Obote had taken and for populist purposes President Idi Amin also decided to expel Uganda's Asian population in 1972. Amin was eloquent in defending the expulsion in economic nationalism terms as he pledged to transfer economic control into the hands of black Ugandans. His plan to use these assets to turn the economy failed to materialize as high-ranking individuals in his regime squandered the ill-gotten wealth and other inexperienced black Ugandans that filled the positions left vacant by the Asian exodus mismanaged everything, the economy collapsed, and Amin's supposed moment of victory over the much hated Asians turned into a tragedy that went on to haunt Uganda. While the expulsion was sociologically unjust, fundamentally racist in conception and economically unsound, one must not forget that the anti-Asian prejudice was established well in Uganda before its independence by British colonial economic policies (Mamdani 1983). Amin's regime turned against Ugandans and butchered in ways not witnessed any in Africa at that time. He destroyed the economy, and in his attempts to divert public attention from these atrocities, he attacked Tanzania and annexed its territory on the Ugandan southern border. President Nyerere replied firmly, and together with Ugandan exiles, they launched a full-scale war on Uganda and Amin took for his life. The return of Obote as Head of State following a sham election in 1980 reversed the trend and the Kakwa; Aringa and Lugbara communities that dominated Amin army also found themselves on the receiving end of state inspired revenge murders. Buganda, which had become a real enemy to Obote after the events of 1966, also suffered a brutal response and vengeance (Mutibwa 1992). Museveni who argued that the 1980 elections were rigged launched a guerrilla war immediately, but it was not his NRA guerrilla rebels that brought Obote from power for the second time but ethnic identity politics within his army itself. Ethnically Obote was a Langi, while ethnic Acholi people from the north dominated the army top leadership. These ethnic groups had their historical difference and a record of conflicts among themselves. However, their alliance was to hold power against other groups or regions in the country. However, while fighting the guerrilla war against NRA rebels led by Yoweri Museveni and dominated by people from western Uganda, Obote was accused of mostly sending soldiers from the Acholi ethnic group to the battlefield while shielding his own Langi people. In 1983, General Oyite Ojok an Acholi and the Army Commander at the time was killed in a helicopter clash in Luwero battlefield. The Acholi top commanders in the army expected him to be replaced by another Acholi because they considered the army leadership their preserve while the Langi's took the political. However Obote replaced Oyite Ojok with Opon Acak a junior officer compared to Bazillio Olara Okello and Okello Lutwa both Acholi senior army officers. In 1985, they led a mutiny that saw Obote over thrown in another coup (Lubega 2013). The Lutwa government started negotiation with the Museveni NRA rebels who failed and the Museveni outfit captured power in January 26, 1986.

## Identity Politics Under Yoweri Museveni Regime (1986–present)

Yoweri Museveni and his National Resistance Movement (NRM) rise to power happened after Uganda had suffered tremendously from mismanaged identity politics. In his rhetoric, Museveni vehemently castigated identity politics and co-opted many rivals both real and potential, different groups and regions into a broad-based no-party movement system. Museveni's own ethno-regional group (Ankole-Kigezi subregion) lacked the demographic weight to rule without building alliances across ethnic lines, particularly regarding the dominant Baganda with whom his NRA built a coalition during the guerrilla war. Thus for self-preservation purposes, the NRM redefined local rights of citizenship in terms of residence rather than ethno-territorial belonging. However, this has not always gone well especially in other areas of ethno-territories where many

migrants from western Uganda are commonly known as *Balaaro* for cattle herders and *Bafuruki* for cultivators. For instance, serious political conflicts based on these local ethnic differences have caused trouble in Bunyoro kingdom where the local Banyoro political candidates were defeated in elections by Bakiiga *Bafuruki* candidates who had emigrated from Kabaale district. This caused serious ethno-political conflicts that led the President to direct intervention and ordered for the deliberate reinstatement of Banyoro candidates as leaders to ease ethnic tensions. These kinds of tensions have spread in other areas with volatile ethno-political tensions such as Kasese and have resulted in serious violence. Furthermore, these kinds of highly division local identity political dynamics have filtered into the creation districts where local ethnicities have refused to coexist and the solution has been creation of different administrative district for each group. There are also other political misunderstandings in Uganda that have taken an ugly identity dimension. For example, in 2009, there was a huge confrontation between the central government and Buganda Kingdom. The central government refused the Kabaka of Buganda Ronald Muwenda Mutebi to visit Bugerere one of Buganda Kingdom counties in present day Kayunga district. The Kabaka insisted on visiting the county and the government blocked him. The resulting demonstrations resulted in the killing of several people in Kampala and destruction of property. The most ugly party of this misunderstanding was that instead of seeing it as a misunderstanding between the Kingdom and the central government, it was seen as a confrontation between the Baganda and Banyankole people from Ankole where most security people and the President come from. Many innocent Banyankore people were targets of attack. Such ugly incidents erupt in Kampala whenever there are violent demonstrations or misunderstandings; the Banyankore become targets of attack just because Museveni and his dominant ruling elite are Banyankore. Given that this has been a common practice not only in Ugandan history but horrifically played out in the 2008 Kenyan election where different ethnic groups turned on each other especially the Kikuyu of Mwai Kibaki and Luo of Raila Odinga, most Banyankore who are not necessarily Museveni supports are forced to vote, support, or defend his regime whenever they are threatened with revenge. In other words, he is a guarantor of their peaceful existence. This is not new or limited to Uganda and Kenya but in most African countries. The Ugandan elite including the civil society, cultural leaders, elders, and politicians has got to work out a formula to ensure that interethnic violence that usually plays out locally and the one boiling underground where other groups now see people from western Uganda as their political problem. Apart from getting a lot of favors in jobs and other national resource allocations, people in the western region vehemently support the Museveni regime in an "us versus them" kind of politics reminiscent of the past Uganda regimes.

While President Museveni has a very strong rhetoric against parochial identity politics, from the very beginning, he was exploiting identity politics to achieve his political objective. In the first place, almost all the fighters of the Museveni National Resistance Army (armed wing of the NRM) which was later renamed Uganda Peoples Defence Force (UPDF) represented a southern identity particularly Ankole the home area of Museveni in contrast to the northern-dominated national armed forces which changed the North–South schism that Uganda witnessed during the independence era. The NRA forces meted horrific revenge attacks on northern soldiers while running to the north after Obote's defeat contributed to the cycle of civil conflict that the country has endured over the last 30 years (Lindemann 2010). Museveni wooed his rivals to form a broad-based government, but many northerners refused to join it, and up to date, the northern region has been systematically underrepresented in key political, military, bureaucratic, and economic institutions of Uganda. However, Museveni's broad-based movement system came under its first serious challenge in 1999 when Colonel Dr. Kiiza Besigye who was President Museveni's personal physician during the 5-year guerrilla war and had served as State Minister for Internal Affairs and

National Political Commissar in the NRM government wrote an internal memo which leaked to the press pointing out that Museveni had digressed from their agreed bush war days' agenda of establishing democracy, rule of law, and constitutionalism, among others. Besigye argued that while Museveni was busy hoodwinking Ugandans with promises of professionalizing the army, ending identity politics, and strengthening democracy, in actual sense, he was doing the very opposite and planning to entrench himself into power for life which has turned out to be almost true because in December 2017, the 75-year age limit was also scrapped from the constitution meaning that in 2021 Museveni will be eligible to extend his presidency beyond 35 years. Besigye who also come from the Ankole-Kigezi subregion retired from the army and launched a presidential bid in 2001 elections, posing the biggest challenge to Museveni's leadership from then up to now.

In 2005, a multiparty dispensation was reintroduced in Uganda, and over 20 political parties have been registered. Among these, the dominant ones are the ruling NRM and the Forum for Democratic Change (FDC) which is the largest opposition party. Apart from JEEMA party which was initially founded to represent the interests of Muslims, most parties have moved away from the identity politics witnessed up to the 1980s as discussed earlier. For instance, DP which was a predominantly Baganda party is headed by Hon. Norbert Mao who hails from Gulu in Northern Uganda. Religion is also no longer a major factor in how parties or politics generally are configured in Uganda. However, ethnicity, though very much camouflaged, is still a key fact in the politics of the country. To untangle how ethnicity plays out in the politics of Uganda under president Museveni, one has to understand how he has structured, controls, and exercises his power. Museveni's leadership style has ensured that there is a deliberate crippling of institutions and establishment of a highly top-down and nepotistic three-level power structure consisting of the inner core, the intermediate circle, and the outer circle. The inner core involves the president himself who is at the center of power, his immediate family including his wife Janet Kataaha, the minister of education; his son Major General Muhoozi Kainerugaba (formerly the Head of Special Forces and now a senior presidential advisor on military issues); his brother General Caleb Akandwanaho (aka Salim Saleh, a Presidential Advisor on Security); and other extended family members including Sam Kuteesa, the minister for Foreign Affairs (the father of Muhoozi wife); Esther Kajubiri, President Museveni's sister and a commissioner for education; Dr. Diana Atwiine, the Permanent Secretary of the ministry of health; Hon. Bright Rwamirama, the minister for Veterans Affairs; and Hon. Frank Tumwebaze, the minister of ICT. These leading figures that are directly related to the first family are the ones at the center of whatever decisions happen within government (Bukenya and Muhumuza 2017). The inner core is the one that carefully selects the intermediate circle based on region, ethnic origin, and religion. These are carefully selected and appointed cabinet ministers or placed in key government positions such as the police, Bank of Uganda, the treasury, revenue authority, oil production armed forces, and police. All the people who wield power in these key positions are mainly people from western Uganda where the president comes from and are trusted by him. Key among them are the governor of the Bank of Uganda, Prof. Emmanuel Mutebile; Mr. Keith Muhakanizi, the Secretary to the Treasury; Ms. Allen Kagina, the Executive Director of Uganda National Roads Authority and the biggest funded sector; Major General David Muhoozi, the Chief of Defense Forces; and other powerful regional political elites who act as his local lynchpins in their areas of origin. These are carefully selected to show that their constituencies are represented at the highest levels of government a strategy that helps explain Uganda's very large Cabinet. The broader outer circle comprises state ministers, local elites that occupy political and administrative positions in local governments, leaders within the NRM party, traditional authorities, and religious leaders. This outer layer and to some extent the intermediate circle are continuously changing because of party and general elections whose outcomes are used by the

inner core elite as the basis for admitting and exiting members of the outer layers (Golooba-Mutebi and Hickey 2013).

## Identity Politics in Museveni's Army

Real power in Uganda now does not lie with the people but the army, and as earlier discussed, this is not new but actually a continuation of what past leaders he castigated did. When Amin was planning his coup, he was advised by Col. Bar-Lev chief of the Israeli military team in Uganda that with a team of 600 well-trained, well-equipped, and loyal soldiers, they could overpower an army of 5000 poorly equipped soldiers (Mamdani 1983). This is probably the one biggest lesson Museveni coped from Amin's era. In addition to exerting very strong control on the regular UPDF and the police, Museveni has created another army within an army called Special Forces under the command of his son Brigadier Muhoozi Kainerugaba. The numbers of this Special Forces are not clearly known to the public, but they are estimated in over 10,000. What is clear however is that they are very well trained, well equipped, and properly screened to ensure that they have full support to Museveni and dominated by Banyakole (Museveni's ethnic group), but the most important point here is that they are capable and are always ready to take on the regular UPDF in case of a confrontation.

## Conclusion

This entry has made headway in showing how race, ethnicity, and religion have been politicized or politically manipulated to acquire and maintain political power in Uganda historically. While a lot of progress has been made in the last 30 years to minimize identity politics in Uganda, there is still a lot to de done. Identifying unifying factors, values, and common challenges such as poverty, unemployment, and climate change, among others, and building consensus on how to address them can contribute to a better Uganda than the differences in its people's identity.

## Synonyms

Cocreation; Coproduction; Governance; Public innovation

## Introduction

The introduction of public innovation labs (i-labs or living labs) came together with the emergence of an open/smart governance paradigm in public management. Different authors foresaw the first steps of a public governance paradigm based on networks and the growing involvement of the society and different societal actors in public affairs and public decision-making. Nowadays, different studies support the idea that there exists a turning point in the evolution of public sector management, implying a new paradigm named open/smart governance. Among other aspects, this new paradigm is also related to the fourth technological revolution, including innovation in the public sector. This new trend has i-labs as one of the platforms to adopt innovative practices in the public sector and coproduction practices. Our perspective is to understand if these initiatives are advancing beyond the generation of ideas, turning them into prototypes, and then promoting the implementation in real settings to improve public administrations and public policy.

Public innovation labs have been defined mostly as arenas for experimentation in public sector agencies organizations. At this stage, there are few scholarly works studying innovation labs and their contribution to the transformation of public sector management. In short, they are organizations, in some cases autonomous from government, based on the generation of innovation, oriented to support public organizations to tackle social problems through open methodologies and collaboration (Criado et al. 2020; Gascó 2017; Ruijer and Meijer 2019). Therefore, living labs' core function is fostering innovation in public sector settings, including action-oriented and experimental methodologies in the process.

In recent years, the rapid growth in the number and scope of governmental innovation labs, also known as i-labs or public sector labs, have occurred due to government' search for better public services. At the same, this trend aimed to respond to the growing demands and expectations from citizens (Acevedo and Dassen 2016; UNDP 2018). This movement to increase the number of i-labs has also been observed in different public sectors (at the executive, legislative, and judiciary

branches of power) and across the three layers of government (federal/national, state/regional, and local/municipal). Therefore, this entry carries out an exploratory analysis of i-labs, examining their nature, scope, and operation, and comparing them internationally, including the attention to different features associated with the sustainability of i-labs.

The introduction of public innovation labs is associated with the emergence of an open/smart governance paradigm. Osborne (2010) and other authors foresaw the first steps of a public governance paradigm based on networks and the growing involvement of the society and different societal actors in public affairs. More recently, different authors support the idea that we are in the middle of a turning point in the evolution of public sector management, implying a new paradigm named open/smart governance (Meijer et al. 2019). Among other aspects, this new paradigm is also related to the fourth technological revolution (Criado and Gil-Garcia 2019), including innovation in the public sector.

Looking at public innovation, different governments have built innovation-oriented spaces. These innovation labs are designed to promote cocreation of new solutions, based on public value generation, and involving representatives of different sectors: government agencies and employees, civil society, and experts. i-Labs open the doors to new methods and collaborative work, as they are designed to cope public societal problems and promote transformations in public management and in the lives of citizens (Criado et al. 2020). Therefore, i-labs are recognized as experimental arenas and they could be public sector innovation catalyst (Bason 2010). In the last 10 years, public innovation labs have been launched in different countries, with different formats, and with the deliberate intent to generate dynamics of transformation in the public realm, through experimentation in the process of generating solutions to increasingly complex social problems (Tõnurist et al. 2017).

Literature on i-labs suggests that success of these innovation arenas depends on different dimensions. They include institutional characteristics, such as leadership support, methodologies affecting the possibility to implement innovations and scalability, and the generation of an innovation-oriented culture (Acevedo and Dassen 2016; Criado et al. 2020). On the other hand, some of the main challenges, particularly in developing contexts, such as in Latin America, involve surpassing tolerance to failure, promote greater interaction with other government agencies, and, above all, consider the need for financial sustainability (Acevedo and Dassen 2016). Therefore, the purpose of this entry is introducing i-labs, exploring the concept, characterization, and innovation stages of evolution.

The rest of this entry is as follows: The next section dives into the notion of i-labs and the implications of this new term in decision-making and policy design processes. The third section characterizes the features of government innovation labs, paying attention to different studies and models previously developed by different authors in this field of research. The final section suggests some future directions regarding i-labs in operation. Also, the conclusion of this entry opens the door to i-labs in the future of public sector and the evolution of public administration.

## Definition of Government Innovation Labs

Government i-labs have become popular in the public sector over the last decades. Studies carried out have been descriptive and normative or in the format of practical guidelines (Acevedo and Dassen 2016; UNDP 2018) and, therefore, there are few systematic cases that seek to understand their nature, objectives, methodology, and potential of public sector transformation (Bloom and Faulkner 2015). Nonetheless, scholars have also developed some empirical studies into this research area in different international contexts (Criado et al. 2020; Gascó 2017; McGann et al. 2018; Ruijer and Meijer 2019; Shin 2019).

There is not a unanimous approach to the notion of innovation lab in the public sector, including its name (i.e., i-labs, government innovation labs, living labs in the public sector, public sector innovation labs, etc.). Although there is no consensus about the definition of what a public sector innovation lab is, Mulgan (2014, p. 11)

considers that they should contain "experimentation in a safe space at one remove from everyday reality, with the goal of generating useful ideas that address social needs and demonstrating their effectiveness." This is a general definition to highlight the practical perspective of these initiatives and should be concerned with finding solutions to real problems in a context of environmental changes.

Schuurman and Tõnurist (2017) consider that the mission of innovation labs is to foster user-focused services based on ICT solutions, in order to handle external changes and define them as islands of experimentation. In particular, "living labs refer to user-centered, open innovation ecosystems based on a systematic user co-creation approach integrating research and innovation processes in real-life communities and settings" (Schuurman and Tõnurist (2017, p. 7). That is, from this point of view innovation labs are arenas for testing and scaling up innovation in public services.

From the perspective of Gascó (2017), living labs in the public sector entail a "collaborative platform for research, development and experimentation in a real-life settings, based on specific methodologies and tools, and implemented through specific innovation project and community building activities" (Gascó 2017, p. 91). Here, one of the critical issues is the idea of citizens' involvement and the capacity to deliver open innovation. This idea is complementary with the assumption of Ruijer and Meijer (2019), who suggest that living labs represent an alternative to experiments in public organizations often operated in (semi) controlled spaces in the public sector.

This is the same perception of Criado et al. (2020), who suggest that the logic of innovation labs in the public sector arises from societies where there is not only a unique viable system of public service delivery, but also new patterns of innovating and understanding how to govern the public sphere. In addition, McGann et al. (2018) have portrayed the role of public sector innovation (PSI) labs for public policy. Here, they suggest that the emergence of PSI labs "has been associated with various policy trends, including growing interest in evidence-based policy-making and the pursuit of 'open government' agendas" (McGann et al. 2018, p. 251). Although there is not a unique perspective on public sector innovation labs, most of the scholars share ideas about their main features.

Finally, McGann et al. (2019) suggest another key idea regarding to i-labs, that is, "the attempt to systematically differentiate innovation labs' role in policy systems from both traditional advisory units within government and the influential non-government actors that are the focus of the literature on deinstitutionalization in policy advisory systems." To put it differently, these authors insist on the idea that i-labs go hand in hand with the growing influence of market and civil society actors in the policy making process. This process is grounded in concepts of coproduction and cocreation, and the intentional attempt to give more space to innovation-based methods and approaches including coproductive models of problem solving.

## Features of Government Innovation Labs

The emergence and dissemination of these initiatives are related to the process of public sector reforms driven by the ideas of New Public Management and, more recently, by the debates on new public governance (Osborne 2010). The focus of the debate has been on the search for better results for citizens, due to the increased pressure from society, tax constraints of governments, and the increase use of information and communication technology. This idea connects i-labs with growing debates in the discipline of public administration and management.

International experiences indicate that i-labs have a focus on the user/citizen. This idea embraces a more active role in terms of participation in decision-making processes, leading to the adoption of more open and participative methodologies based on cocreation, coproduction, and

codesign (Torfing et al. 2016). Greater openness would require the adoption of participatory methodologies such as design thinking or design science research (McGann et al. 2018).

One of the main characteristics that stands out in i-labs is their small size in terms of staff, low turnover, less hierarchical rigidity, and support of the board (Tõnurist et al. 2017). Innovation teams, or i-teams, would be created by political leaders seeking to overcome traditional trends in the public sector, such as managers' focus on performance, inflexible budgets, and bureaucracies resistant to experimentation and change (Puttick et al. 2014). In these structures, however, it is not always possible to distinguish the innovation lab budget from the organization in which it operates, raising questions about the sustainability of these initiatives (Acevedo and Dassen 2016; Tõnurist et al. 2017).

As for the objectives of innovation labs, an IDB survey identified seven of them: foster an innovative environment in public administration, develop specific innovations, introduce technologies to public administration, modernize public administration processes, introduce new communication methods in public administration, and open public administration data (Acevedo and Dassen 2016). In turn, the study carried out by Nesta classified the laboratories into four categories based on the activities developed: creating solutions to solve specific challenges; engaging citizens, nonprofits, and businesses to find new ideas; transforming the processes, skills, and culture of government; achieving wider policy and systems change (Puttick et al. 2014).

There are some points in common between the results of the two above-mentioned surveys. Among them, we highlight the creation of specific solutions to priority problems demanding applicable and scalable solutions; in this context, i-teams can be considered developers and creators of innovations (see Table 1). Hence, the introduction of technologies in the public sector could be incorporated into this group, considering that ICT tools are important in the innovative process in the public sector (Ståhlbröst and Holst 2017).

The IDB's research emphasized citizens' participation in the innovation process, but this role was extended in the view of Nesta. This approach included nongovernmental organizations and the private sector, a situation that is also highlighted in other studies. In this perspective, the public sector needs to be prepared to listen to the ideas coming from outside its own system, and to devise communication and community-building strategies to foster the engagement of different stakeholders. This innovation team would then have the role of facilitating participation, allowing innovations to come from the external environment as well.

Modernization of management procedures in the public sector and the strengthening of an innovative environment proposed by the IDB are related to the goal of transforming processes proposed by Nesta. In order for this process to take place, it would still be necessary to offer training

**i-Labs and Public Administration: Public Innovation and the Future of Public Sector, Table 1** Types of i-labs according to its objectives or purposes

| No. | Category | NESTA | IDB |
|---|---|---|---|
| 1 | Developer or creator | Creating solutions to solve specific challenges | Develop specific innovations; introduce technologies to public administration |
| 2 | Enabler | Engaging citizens, nonprofits, and businesses to find new ideas | Create new mechanisms of citizen participation; introduce new communication methods in public administration |
| 3 | Transformer | Transforming the processes, skills, and culture of government | Modernize public administration processes; foster an innovative environment in public administration |
| 4 | Architect | Achieving wider policy and systems change | – |

Source: own elaboration based on Acevedo and Dassen (2016) and Puttick et al. (2014)

and seek external support, as well as creating incentives structures (i.e., prizes and rewards) and mechanisms for evaluating their results. The opening of government data for new solutions to be sought could also be framed in this category, since the literature has pointed out the difficulty in opening public data and a greater predisposition to opening information would require change of culture in public managers (Ruijer and Meijer 2019). The last objective identified by Nesta does not find direct correspondence in IDB perspective: achieving wider policy and systems change.

In addition to the dimensions presented in Table 1, Mulgan (2014) highlights the importance of other variables to understanding i-labs. The first element concerns the method used to develop innovations (design, data, behavioral economics, hybrid, etc.). In addition, it is important to consider the sector to which the laboratory is developed (i.e., education, health, public security, etc.). The third aspect refers to the focus of action in the innovation process, that is, in the form of awareness of problems, generation of ideas, implementation, and scalability, according to the stages of innovation of Fig. 1.

The fourth dimension comprises the purpose of i-labs: development of innovations, training public servants, funding innovative projects, promotion of coparticipation, etc. Finally, it is needed to consider the degree of involvement of i-labs in the public sector, that is, to what extent they are a section/department within a public agency, a mix between public and private funding, or an innovation space completely separated from the public sector (based at an university, private foundation, company, etc.).

Mulgan (2014) also considers that the simplest way to sort the i-labs is from the analysis of methodologies they adopt. Then, this author identified that surveyed labs focus only on the first three stages of innovation, that is, neither they are implementation oriented nor scalable, although they intend to influence the whole system and not be restricted to generating ideas.

In addition to the methodology adopted by the i-labs, the study of Puttick et al. (2014) identified other common factors that complement the variables already presented. These factors are the following: (1) availability of self-funding resources or external sources; (2) the type of leadership and the political support to the initiative; (3) alliances with other sectors (internal and external to the government); and (4) impact measurement. These features shape i-labs capacities.

## Future Directions and Conclusion

Our study suggests a change in contemporary public management. Specifically, innovation labs or i-labs confirm a trend oriented to blur organizational boundaries in the public sector and to put together external actors in the decision-making process of solving social problems. Additionally, this approach has shown that it is necessary to adopt agile methodologies in the public sector,

**i-Labs and Public Administration: Public Innovation and the Future of Public Sector, Fig. 1** Stages of innovation. (Source: Mulgan 2014)

more perceptive to the needs of changing environments with increasing volatility. In addition, i-labs evidence knowledge is distributed in society and it should be incorporated in the public sector. Hence, large organizations must be permeable to absorb the experience and expert knowledge coming from the environment if they aspire to take part of the future. This is also the case of public sector organizations.

Openness of data would increase the transparency of government, reduce the information asymmetry in the State-society relationship, facilitating citizen and civil society organizations' participation in the design, implementation, and evaluation of public policies, and, therefore, increase social control and democratic accountability (Janssen et al. 2012). Some authors claim this implies a new paradigm called open/smart governance (Criado and Gil-Garcia 2019; Meijer et al. 2019). This new paradigm in public management encompasses "*inclusion of external agents to the decision-making processes in public organizations; collaborative dynamics requiring to launch certain projects in distributed work groups (holacracy); radical transparency of organizational processes; transformation of the intermediation dynamics; cost reduction of making information accessible; and continuous evaluation linked to the traceability of actions in these new digital cooperative spaces*" (Criado and Gil-Garcia 2019). Therefore, i-labs will be part of public sector organizations in the near future.

In all i-labs, there exists a common orientation to achieve public innovations aimed at solving social problems, through the use of massive data, application of experimental and agile methodologies, openness to collaborate with citizens and other organizations, and prototyping solutions to real problems in specific contexts, whereas they have different formats. In some cases, i-labs derive from a university environment. This is the situation of the GovLab at the University of the Governance Lab Utrecht. Here, the processes of innovation are oriented to foster, not only governments and public administrations, but also academic research (potentially including any government). In other cases, innovation labs have been directly promoted by governments themselves. This is the case of the Government Lab of Chile (*Laboratorio de Gobierno*). Then, in this second group their funding and innovation focus are oriented to improving that specific public agency or government (although they may also involve other administrative levels in their operation).

There are other types of i-labs oriented to the solution of public problems. Acevedo and Dassen's (2016) study adds as innovation labs the so-called labs for social innovation. In this same line of research are Gascó (2017) or Tõnurist et al. (2017), asking the latter why the innovation labs are created in the public sector and test hypotheses in practice. Thus, the limits of i-labs will be porous, not only in their relationship with the public sector, but also addressing conventional social innovation. At the same time, all of them have in common the interest in promoting an environment of innovation in public sector organizations and developing innovations in products or services by experimental means.

Besides, we look at the growth of i-labs as an opportunity that opens up governments and public administrations around the world to experiment with the growing complexity of social problems. In some cases, i-labs can be promoted by themselves (governments and public organizations) as internal departments to foster ideas and collaboration dynamics. In other cases, i-labs can be developed as hybrid arenas to make possible the interaction of public sector organizations, putting the citizens at the center, with external partners, experts, and other organizations involved in the problems. However, we are still at a very early stage in the implementation of the idea of innovation in the public sector (including i-labs), especially the capacity to challenge the power dynamics and traditional work processes (De Vries et al. 2016). As a matter of fact, the above-mentioned changes can only be carried out through the application of collective wisdom or crowdsourcing, as well as cocreation and coproduction of public services oriented to create public value and generating smartness in government (Gil-Garcia et al. 2016; Rodríguez-Bolivar and Meijer 2016).

Here, we make a warning call about the risk of creating i-labs as a fashion or an advertising strategy to gain stage in the political realm. Associated with this warning, we also have to discuss the sustainability of actions that are implemented by i-labs. Mostly, they rely on external resources that might put their sustainability at risks. At the same time, another challenge is the scope of the prototypes generated by i-labs and how they scale in the process of implementation and provide a greater impact on society. Here, public sector organizations testing prototypes need to be prepared to hear ideas coming from the outside context, and develop communication strategies increasing the involvement of different stakeholders.

Public value generated by i-labs will derive from their capacity to modify public sector rules and service dynamics, both formal and informal, as well as the balance of power, not only within public organizations, but also in their relationship with society. Then, the potential of these arenas for public innovation still seems limited to the extent that the experiences underway have had a very specific focus, both in thematic focus or policy areas and in scope of the defined transformations (more as developers, facilitators, or educators, than architects). Broadly, they have been oriented too much in processes and less in the conceptual or cultural dimension of public sector organizations. As pointed out before, public i-labs will extend their transformation capacity as they are part of broader innovation ecosystems involving more actors and more complex social and policy problems. Finally, one should enhance the public value created by i-labs implementing flexible actions in public bureaucracies and improving delivery of public services to citizens. At this stage, i-labs may be the suitable arenas for open innovation in the public sector, which can contribute to promote a culture of change in public sector organizations.

# Image of a Local Area: Measuring and Managing

Vincenzo Vignieri
Department of Political Sciences and International relations, University of Palermo, Palermo, Italy

## Synonyms

Image of local area; Impression of a place; Place conceptualization; Place perception; Representation of a territory

## Definition

The image of a local area can be conceived as cumulative beliefs, ideas, opinions, and experiences people have about a place. Image embodies a large number of information, memories, and suggestions that pertain to a specific place, which are processed by human mind by selecting relevant evidence from a big amount of data about a local area. Image conceptualizes the value and/or a certain level of performance that a place expresses and it inspires human behaviors. The image of a local area is perceiveid by people, it is part of knowledge structures related to a place and it is long-lasting and difficult to change. Measuring and managing the image of a local area can support the socioeconomic development of a local community by providing to local policy-makers the necessary information to support them in improving policy outcomes. When applied to a local area, an outcome-based dynamic performance management approach provides decision-makers with the appropriate set of information to effectively allocate resources coherently with the pursued objectives. In this task, performance drivers provide to both managers and politicians relevant measures which give insights and policy recommendation on how to manage the image of local area.

## Introduction

The image of a country image has become a crucial success factor, and governments are called to manage their country reputation, especially when domestic firms look to expand their markets overseas. The image of a country is not under the marketer's control – unlike product or corporate brand – but it has a big impact. "In fact, there remains much misunderstanding and many commentators and some consultants and academics still interpret 'place branding' as simply the application of product promotion, public relations, and corporate identity activities for countries, cities, or regions, as though they are mere commodities" (Porter 2011: 1).

Places, like brands, have an image that "represents a promise of value and performance, incite beliefs, evoke emotion and inspire behaviors" (Kotler and Gertner 2011: 35). If the marketing department of a business organization may leverage products and brand image with investments,

for local policy-makers managing the image of a place is not an easy task. As Kotler and Gertner (2011: 35) emphasized, the image of a place can be conceived as "the sum of beliefs and impressions people have about places. Image represents a simplification of a large number of associations and pieces of information connected with a place. They are a product of the mind, trying to process and pick out essential information from huge amounts of data about a place." Place image represents knowledge structures related to places, which are long-lasting and difficult to change (Kotler and Gertner 2011: 35). Place image is "the total of all descriptive, inferential and informational beliefs one has about a particular country (Porter 1995). Images represent a simplification of a large number of associations and pieces of information connected with a place (Porter 2011: 1).

At local level policy-makers have to act alike, if they want to attract business ventures and tourists or to export local products. To manage the image of a local area local policy-makers have to face a number of challenges. They are called to frame the sources of that image, understand what the driving factors are, and lastly, identify some leverage points which act for designing sustainable public policies. This context demands for an outcome-based performance management system which allows decision-makers to measure both the "output" – or the volume of products and services completed or delivered – and the "outcome," the results, the effects, or the consequences of service delivery that are important to the public.

Studies on place-image relationships are mainly focused at national scale and take a marketing perspective, and only a few authors have investigated the country image from a managerial and institutional perspective. In addition, as Matarazzo (2012: 38) pointed out, main weakness in the literature on country-image relationships is related to the fact that a majority of studies in the field, have employed quantitative techniques to measure a limited set of categories causing a lack of exploratory research.

The purpose of this work is threefold: it aims to explain the sources of the image of a local area, offer both a framework and associated measures to manage it. To this end, this research suggests to adopt an interinstitutional outcome-based Dynamic Performance Management (DPM) approach to measure and manage the driving factors of the image of a tourism destination.

## Discussing the Relationships between Place and Image

Two important constructs characterize the studies on the relationships between place and image: this literature distinguishes them as the "Country of Origin Effects" (CoO) and the "Competitive Identity."

The "Country of Origin Effects" is adopted to explain the influence, either positive or negative, that the country of origin of a product has on consumer behavior. Literature on CoO classifies such a concept in two formulations: *halo* and *summary* effects (Han 1989). The *halo* effect is the influence made by the country of origin on consumers' purchase intention when there is a lack of experience with a given product and thus potential customers evaluate products using their perceived country image that rely on the general knowledge they have about the country itself, including its people, and its level of economic, political, and social development. Through country image, consumers may develop an attitude toward a brand. Therefore, their purchase intentions mature (Han 1989, 1990). The *halo* effect has the following relationship:

Country image → Beliefs → Brand attitude

*Summary* effect takes place when consumers are unfamiliar with a product from a particular country, but they have experiences with other products from the same country. Hence, consumers may use their experiences, as well as mass media information or word-of-mouth, to develop an attitude toward that product (Johansson 1989). Han clarified that when it comes to the *summary* construct, consumers derive a country image from products information about product attributes.

Beliefs about product → Country image
→ Brand attitude

The two effects are highly connected. Fruchter, Jaffe, and Nebenzahl (2006) presented a dynamic model that includes both *halo* and *summary* constructs. Without product familiarity, the country image affects the purchase decisions. After purchases, consumers mature experiences with products that allow them to adjust the country image according to the recent experience. The more the country image relies on the most recent experiences with products, the more it works as *summary*. "The direct effect of country image reflects its use as a summary construct, while the indirect effect, through product beliefs, represents consumers' use of country image as a halo" (Matarazzo 2012: 32).

A second construct which has contributed to the literature on place-image relationships is the competitive identity theory developed by Simon Anholt (2007). At the core of this framework, there is the idea that "country's (and, by extension, cities and regions too) reputation is associated with domestic identity, politics, and economics rather with branding as it is for businesses in the commercial sector" (Anholt 2011: 21).

Although places do have brand images, they are not primarily about marketing, as it has often been assumed. Place image is a perception and it does not reside in the municipality or tourist agencies' offices. It exists in the mind of the people; it is stored in a remote location, hence talking about the image of a place means to manage the attributes of this location and then the story told through media about this location (Kotler et al. 1978).

According to Anholt's perspective, the most valuable asset for a country is the name of the country itself, which evokes its image. Governments, local administrations, and entrepreneurs – only to mention a few – are called to manage the world's perception of their place image and to develop a strategy for managing it.

Anholt developed a model (Fig. 1) which incorporated six areas of activities that a country should address to build a strong place image.

**Image of a Local Area: Measuring and Managing, Fig. 1** The hexagon of Competitive Identity (Anholt 2007: 26)

Particularly, places have to undertake tourism promotion activities and improving experiences in visiting the place, since both function as word-of-mouth mechanisms in influencing the image of place. The products exported from a place are the ambassadors of that place and they communicate its value and tradition. The political decisions making as it is reflected by mass media. The method is used by a place to attract investments like businesses, human resources, or foreign companies. A place should support cultural exchange and activities aimed at hosting international events and exporting local heritage through the museums, bands, and theaters. Lastly, the way residents behave abroad and how they treat tourists and visitors at their home country.

The basic theory behind the hexagon is: for decision-makers to build a positive image, they have to develop a clear idea of what a place is and stands for and then they have to manage and coordinate all the six points of the hexagon.

What Anholt's approach emphasizes is that place image can be neither built nor changed through communication: it is not a marketing concern and communication may help only in spreading what a country makes and does. To build and manage a strong competitive identity, local decision-makers need to develop a strategy (goals), to create real substance (implementation actions) and do not overlook just symbolic actions (communication) (Anholt 2011: 28).

The concept of CoO communicates the effects the image of a place has on consumer behavior as

well as the implication for firms that want to exploit its effect. What CoO studies are not able to explain is how a place can build such an image.

Even though the "Competitive Identity" hexagon tries to create a systemic way of looking at the image of an area, the research used statistical techniques that are suitable for cross-national comparative analysis through indexes, but they are not able to explain the underlying causes of place's image dynamics.

The image of a local area does not rely only on what various public institutions do, but it is a multifaceted, synthetic result of the overall geographic area including different institutions, public and private organizations, citizens, and firms too.

A local area is characterized by a dynamic environment where public organizations are loosely coupled (Meyer 2002): i.e., municipalities, as well as regional administration, are in charge of promoting tourism in the area, but they operate without any strategic alignment. There is a weak coordination in the interplay between public and private actors' strategies that lead to high degree of fragmentation of development policies. There are significant delays between policy adoption and related effect because the latter quite often depends on the availability of funds from the European Union and the investments lag behind formal decisions (Bianchi 2010a). To frame the sources of a local area image, it is necessary to broaden and enhance the standpoint, embracing an interinstitutional outcome-based perspective.

## A Dynamic Approach to Frame the Sources of the Local Area Image

"Places compete in attracting visitors, residents, and businesses [. . .] a place with a positive reputation finds it easier to vie for attention, resources, people, jobs and money; a positive place reputation builds place competitiveness" (Morgan et al. 2012: 3). If a local area wants to develop sustainably it needs to manage its image actively and both public and private organizations need to discover what the perception of their place is, and to develop a strategy for managing it. Thus, local actors are called to attract investments, public funds, infrastructures, companies, population, human capital, tourism, arts, and global events. This implies consideration of a systemic approach according to which the performance of a local area lies behind the capability of both sectors to generate value individually (Bianchi 2010b). If one adopts such a point of view, this development challenge requires coordination and an outcome perspective when assessing the impact of policies on local area performance and long-term sustainability.

To make decision-makers aware of the possible behavior of a set of crucial system variable, it is necessary to blend span and depth of performance measurement/management tools. In other words, such a change requires to integrate inputs, activities, outputs, and effects/outcomes with strategic and operational objectives and associated measures, at the organizational level (*micro*), at the policy level (*meso*), and the interinstitutional level (*macro*) (Bianchi 2010b). The objectives derive from an environment whose structure influences the outcomes for the local area, and in turn its generation is essential for the overall system's development as well as to raise sufficient resources (Borgonovi 2002) to maintain it. At the interinstitutional level, the interaction among policies of different institutions strongly influences performance. The advantages to adopt an interinstitutional perspective is to capture the outcomes, as achieved by the broader context of the local area. Such a point of view could be defined as external, meaning that a "formal model can be considered to be objective instances of a reality domain" (Größler 2010: 385) since it does not reflect the observation point of a specific decision-maker. SD models aim at producing "qualitative statements about modes of behavior, appropriate performance indicators and effective leverage points" (Lane 2012: 591). Insight SD modeling is an established practice used to inform the understanding of processes (Ghaffarzadegan et al. 2011). DPM by combining SD methodology with performance management systems enriches the perception of the investigated problematic behavior. DPM through conceptual models

identifies the structure behind problems and enhances the understanding of the causal connection of a given time development.

As Bianchi (2012: 149) pointed out "conventional financially focused P&C systems have been considered lacking in relevance since they are not able to provide information that can support either dynamic complexity management, the measurement of intangibles, the detection of delays and to deal with the sustainable growth." A sustainable growth is characterized by a condition according to which the rate of change of the endowment of strategic resources is in balance with underlying resources utilization processes. By taking this perspective, accumulation and depletion processes of shared strategic resources strongly influence the local area's performance, therefore to manage a local area's performance, it is crucial to define key success factors driving such a performance. Fig. 2 shows the relationship between strategic resources, performance drivers, and end-results of both outputs and outcomes.

As Fig. 2 portrays, DPM requires that end results be explicit. Consequently, it is necessary to identify performance measures which are able to capture both end-results and associated performance drivers. Drivers are ratios (i.e., as a ratio between an organization or a local area's performance and a benchmark, or target) and they represent those factors able to explain, cause, and fuel the end results. While the numerator of a performance driver is the current state of performance, the denominator can be a benchmark/target/desired value, against which compares the actual result. As Fig. 2 shows, decision-makers have to act on the upstream level changing the linked strategic resources. If decision makers act alike, they may affect performance drivers and, in turn, improve end-results. It is through the end-results that they can build up, preserve, and deploy strategic resources. Managing strategic resources to affect both performance drivers and end-results in accordance with the other system's players is a complex task, especially because intangible resources (i.e., image, reputation, social capital) are difficult to define as well as to measure, but they play a significant role in affecting performance. Such a task is complex due to inherent delays that make difficult to perceive the effects generated by decisions. Delays, together with

**Image of a Local Area: Measuring and Managing, Fig. 2** The dynamic perspective of performance (Adapted from Bianchi 2016: 73)

nonlinear relationships, are major cause of trade-offs in time and space, to understand and counteract such phenomena DPM offers an effective method.

## Modeling Local Area Image through an Outcome-Based Dynamic Performance Management View

As Forrester (1992: 56) emphasized, the information for understating the causalities behind phenomena can be attained from different sources: from decision-makers' "mental database" to numerical databases. Likewise, as Yin (2013: 116) put it, "no single source has a complete advantage," therefore many sources should be used. Therefore, to develop the model multiple sources of evidence have been used: interviews with local decision-makers and semi-structured interviews with local entrepreneurs have been performed; district documents, statistical databases have been read; comments and feedbacks on tourism- and travel-oriented websites have been coded (Fig. 3).

**Box 1 Case Study: "Taormina Etna District"**

"Taormina Etna district" is the brand for a local development agency that supports firms and municipalities located between Messina and Catania, along the Sicilian East Coast. Since the beginning of the 1990s, Integrated Territorial Projects (ITPs are a modality of implementation of European structural funds. ITPs were introduced for "objective 1" programs and were then extended to the other types of regions. ITPs are a combination of different measures deriving from the structural funds on the basis of local strategies designed by local partnerships. The selection of projects is usually made by regions on the basis of criteria agreed upon with local partnerships.) (ITPs) defined Italian local development policies. These projects have become a powerful instrument to foster local sustainable development and a vehicle to involve the lowest levels of the Italian governmental in the long-term strategies. In Sicily, many municipalities have created agencies as a form of public-private partnerships aiming at (i) coordinating growth strategies, (ii) monitoring investments and secure funding from different sources, (iii) supporting projects development to capitalize on local resources and tackle those factors limiting the socioeconomic growth.

In its territory, the district includes two famous icons of Sicily: the city of Taormina and the Etna volcano. The area characterized by a coastline includes three natural parks and four natural preserves; it is full of small villages rich in history, local cultures, products, and popular traditions. Taormina has been an international icon of tourism since the end of World War II. It has been a destination for luxury tourism, intellectuals, and VIPs such as writers and royalty.

Another icon of the area is the Etna volcano that lies above the convergent plate margin between the African Plate and the Eurasian Plate. It is the tallest active volcano in Europe currently 3329 m (10,922 ft.) high. In June 2013, UNESCO added ETNA to the list of World Heritage Sites. It represents a noteworthy attraction for tourists and a great resource for the local economy. The fertile volcanic soils support extensive agriculture, with vineyards and orchards spread across the lower slopes of the mountain and the broad Plain of Catania to the south.

The aim of the district is to well manage local, natural, and cultural resources through the enhancement of hospitality infrastructures, the implementation and promotion of local products and traditions as well as the education of human resources (DTE 2009: 3). To achieve such goals "Taormina-Etna district" has operated through project-based activities aimed at attracting funds from national, regional,

(continued)

**Box 1 Case Study: "Taormina Etna District"** (continued)

and European programs. The district received funds for five ITPs through which it spent more than EUR150 million (59% as public funds, 41% as private capital). The funds have been used to subsidize businesses, create public infrastructures, and support touristic marketing initiatives (DTE 2015).

The realization of the ITPs has created new business ventures and has provided opportunities for local entrepreneurs to increase the operations of their firms. The promotional initiatives have generated a certain amount of contacts between the district and the potential market. All of these results are at best output of strategies or indicate just an input acquisition since they represent a prerequisite to produce value for the local community.

The model portrayed in Fig. 4 is the result of interviews, conference reports, and archival

**Image of a Local Area: Measuring and Managing, Fig. 3** The geographical area of "Taormina-Etna district"

**Image of a Local Area: Measuring and Managing, Fig. 4** The sources of the local area image (simplified version of the SD model)

records. It shows causal relationships and evidences four synthetic factors influencing the image of the local area.

Defining the four constructs of the causal model portrayed in Fig. 4:

- Level of tourism development denotes the position of the destination in a specific phase of the evolution cycle. It reflects the growth rate of tourism in the area by considering arrivals, presence, and the average length of the holiday. Such a measure influences the strategies of local organizations as the destination goes through its cycle. The more tourists in the area, the higher the willingness of people to invest in the local area will be. Those investments may change the local area image.
- Fit of contextual attributes depends on the local promotion, cultural and environmental policies. It synthesizes the use of the land, natural attractions, cultural attractions, artificial facilities, and easiness to visit the attractions around the places in which the tourists reside. It captures how the tourists live in and experience with the local area.
- Strength of identity stands for the promotion of typical local products, local heritage, and local traditions towards the tourists. It also includes the degree of integration between the producers, if they use local raw materials in producing their products or if they share innovation project. Strength of identity tries to illustrate the extent by which the place talks about its history and values through museums, products, and food.
- Synergy between public and private sector means that public and private organizations run projects aimed at improving their own respective results, such as networking activity among hotels, restaurants, and museums; websites and info-points to share information about the destination; a unique label to certify the local production.

The factors from one to three are additive, while the synergy between public and private works as multiplier of the first three elements. Table 1 links the first-level performance drivers with second-level, connecting associated measures.

**Image of a Local Area: Measuring and Managing, Table 1** Performance drivers (bold, abbreviation in parenthesis), definition (italic), and measure

| First-level performance drivers | Second-level performance drivers | Measures |
|---|---|---|
| **Level of tourism development (TD)** | **Tourist fractional growth rate** (TGR) | % |
| | **Bed fractional growth rate** (BGR) | % |
| | **Weighted average holiday length** (WAHL) | Days |
| **Fit of contextual attributes (CA)** | **Average structure's size** (AVG-ST-SIZE) | Bed/structure |
| | **Urban density** (UD)<br>*Urbanized land/total land* | Dimensionless |
| | **Attraction density** (AD)<br>*Total attraction/local area surface* | Attractions/$m^2$ |
| **Strength of identity (I)** | **Local-oriented attraction ratio** (LAR)<br>*Number of local-oriented attraction/total attraction* | Dimensionless |
| | **Typical labeled product ratio** (TYP)<br>*Number of firms producing labeled products/total firms* | Dimensionless |
| | **Integration of supply chain** (ISC)<br>*Number of restaurants using local products/total restaurants* | Dimensionless |
| **Synergy between public and private sector (SYN)** | **Integration of innovation,** i.e., internationalization, R&D, know how (INN)<br>*Number of firms sharing a project/total firms* | Dimensionless |
| | **Density and scope of touristic circuit** (DSTC)<br>*Number of affiliated activities*category of activities*(surface of covered municipality/total land surface)* | Dimensionless |
| | **Strategic dialogue in the local area** (STDLG)<br>*Number. Of agreement achieved/total agreement* | Dimensionless |

After having defined the performance drivers, the next section of the work will discuss how DPM may support decision-makers in managing the image of a local area and to improve the local area's performance sustainably

## Sketching a Dynamic Performance Management Chart to Manage the Local Area Image

The model is composed of two fundamental equations, where the image is modeled as adaptive expectation through the exponential smoothing of its source. In this way, the model – as the simplest information stock does – adjusts the belief to the actual value of the input variable (The input value is the sum of three first-level performance drivers, multiplied by the synergy between public and private sector.) gradually. The *change in the image of the local area* (1) updates the perceived value of the *local area image* (2), according to a certain perception time.

$$\textit{Change in local area image} = \frac{(((\mathrm{TD}+\mathrm{CA}+\mathrm{I}) * \textit{SYN}) - \textit{Local area Image})}{\text{Time to change image}} \quad (1)$$

$$\textit{Local area image} = \int_0^t \textit{Change in local area image} * DT + \textit{Local area image}_{t0} \quad (2)$$

As equation (These abbreviations can be found in Table 1.) 1 shows, the four first-level performance drivers affect the "change in local area image." The four first-level performance drivers are the multiplication of the relative normalized second-level performance drivers. Indeed, they compare a current state of the system with a given benchmark (i.e., a target value, a competitor value, or a desired level). The following equations present the first-level performance drivers as composed by the second-level performance drivers (In an SD model, those drivers normalized through a benchmark value. This value works for a nondimensional input to the table lookup function that converts this input into a min-max scalable output.). Equations 3, 4, 5, and 6

represent the first-level performance drivers as part of an SD model.

$$\text{Level of Tourism development } (TD) = \left(\frac{TGR}{Target\ TGR}\right) * \left(\frac{BGR}{Sicilian\ BGR}\right) * \left(\frac{WAHL}{Target\ WAHL}\right) \quad (3)$$

$$Fit\ of\ contextual\ attributes\ (CA) = \left(\frac{AVGSZ}{Desired\ AVGSZ}\right) * \left(\frac{Sicilian\ UD}{UD}\right) * \left(\frac{AS}{Target\ AD}\right) \quad (4)$$

$$Strenght\ of\ local\ identity\ (I) = \left(\frac{LAR}{Target\ LAR}\right) * \left(\frac{TYP}{Desired\ TYP}\right) * \left(\frac{ISC}{Desired\ ISC}\right) \quad (5)$$

$$Synergy\ between\ public\ and\ private\ (SYN) = \left(\frac{INN}{Desired\ INN}\right) * \left(\frac{DSTC}{Desired\ DSTC}\right) * \left(\frac{STDLG}{Target\ STDLG}\right) \quad (6)$$

Once the performance drivers are pointed out, the linked strategic resources are made explicit. Thus, the leverage points upon which the decision-makers can intervene to affect the outcome – through the performance drivers – are clearly revealed. In this way, each decision-maker may identify those strategic resources he manages and understand which output he should improve.

As Fig. 5 shows, the change in the local area image will increase the perceived local area image, which in turn, – all other things being equal – will cause an increase in tourism arrivals; an increasing number of tourists means more value for the local area to support the policies.

The end result is affected by four first-level performance drivers, which comprise 12 second-level performance drivers that in turn depend on the strategic resources. As the DPM chart (Fig. 5) clearly shows, it is not possible to affect performance drivers directly since they compare a current state of performance with a given benchmark. It is, rather, possible to design policies to affect the upstream strategic resources in order to influence the drivers, and finally to improve the outcome.

The driver "fit of contextual attributes" synthesizes the suitability of contextual attributes with tourism activities. To increase such drivers, it is necessary to increase the strategic resources "attraction" (i.e., by renovation of heritage building, by opening museums). On the other side an increase in the number of building (i.e., houses for holidays, apartment building for citizens) also increases urban density and it will reduce the "fit of contextual attributes." Policy makers may strengthen local identity by increasing the strategic resource "attractions" that relates to local history and cultures, likewise the number of firms producing typical products. The performance driver "Level of Tourism development" captures the lifecycle of the destination by considering the growth rate of tourists, the weighted average of the holiday length, and the bed growth rate. These measures gives suggestions about the need of new/better clear destination positioning.

The most effective way to improve image is through synergy between the public and private sectors. It compounds the policy-makers' results in the other three driving factors. If the number of attractions is increased but that is not linked with accommodation services and transportation facilities or not listed on tourism websites, the image can only be slightly improved. In the same fashion, the firms producing typical products should supply local restaurants, jointly run projects (i.e., R&D, internationalization, export consortia), and together with public institutions outline strategic plans for the local area. Increasing the synergy between both private and public sector will spread out the positive effect throughout the system.

By following the discussion of the model, it is possible to give some policy suggestions to decision-makers. They may want to consider a more balanced approach to image management,

**Image of a Local Area: Measuring and Managing, Fig. 5** A Dynamic Performance Management view of the image of a local area

I

which could include all or most of those performance drivers described in this research. They should manage the size of the hospitality structure, avoiding both super small structures that raise the per-night prices and super big hotels that increase soil erosion and concentrate tourists in one place. Local history and tradition should be more connected with natural attractions (beaches and mountains) and leisure, and typical products should be standard ingredients in local restaurants. Policy-makers should network the small municipalities and the private sectors in a more comprehensive tourist package, increasing the scope of the journey across the local area. Before moving to the conclusions, it is important to make clear the limitations of the model. According to Sterman (2002: 513), "the most important assumptions of a model are not in the equations, but what's not in them; not in the documentation, but unstated; not in the variables on the computer screen, but in the blank spaces around them." The model here discussed is necessarily limited regarding the number of feedback loops described, because a large number of factors should be included and taken into account to map all the relevant feedbacks. Weaknesses involve some of the linkages between each organization and the entire system. For that reason, the DPM analysis presented here considers only the main feedback loop involving the performance drivers affecting the end-result under investigation.

## Conclusions

To frame the image of a local area this work has proposed an outcome-based DPM perspective, which differentiates this work from established studies on place-image relationships. The DPM chart connects institutional outputs with the interinstitutional outcome. However, the model discussed in this work needs to be further developed into a simulation model. Such an advancement may help policy-makers in understanding the dynamics of accumulation and depletion processes of strategic resources and in assessing the sustainability of alternative policies. Through dynamic simulation, one may show how performance drivers interact, influence each other, behave over time, and identify the effectiveness of alternative leverage points. The model identifies four main driving factors (i.e., four performance drivers): the level of tourism development, the fit of contextual attributes, the strength of identity, and the synergy between public and private sector. These performance drivers – in combination with twelve indicators (i.e., second level performance drivers) – enable decision-makers to adopt performance measures which give insights and policy recommendation on how to measure and manage the image of local area.

## Immigration and Globalization

Desmond Cahill
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

Across the world, people are on the move, not only as tourists but more for the permanent or temporary long term as immigrants and refugees, as international contract workers and international students. Jetliners have become more spacious with greater range, enabling all types of people to move around the world to reside away from their homeland. Increasingly, for many people, home itself has become a problematic concept. They have been and remain on the move, carrying not only their heavy bags of belongings but also their cultural, linguistic, and religious baggage and their aspirations to succeed in their new chosen country and to expand, even problematize, their cultural and occupational identities.

According to the 2013 World Migration Report of the International Organization of Migration, 214 million people were living outside their home country either permanently or for a temporary long-term period usually longer than 6 months. The Report states, "Throughout the history of mankind, human beings have migrated in search of greater opportunities and a better life. While migration is driven by many complex factors, most migrants want to earn a better living, to live in a more agreeable environment or to join family or friends abroad. Many, however, do not move of their own free will but are forced to do so – refugees escaping persecution, for instance; people devastated by conflict or natural disasters; or victims of trafficking. But those who willingly choose to migrate are largely driven by the desire for greater happiness, prosperity and well-being" (International Organization of Migration 2013, p. 23). In 2016, the number had risen to 244 million.

However, it must be recognized that migration is always a risk. Research suggests that in migrating permanently to developed countries between 4 and 10% do not achieve success. In all immigrant, refugee and worker movements to developed countries, there is always a small group for whom the decision to migrate ends in disappointment, if not personal or family disaster. Expectations may not have been met. The support may not have been enough. Opportunities may not have been available. They may not have had the psychological resources or the key adaptability attributes to cope. The migrant worker may have been injured or killed in industrial accidents or been

sexually abused and exploited. The specter of the defeated migrant who has lost control of his or her life and of the smuggled or trafficked migrant haunts all migration movements.

## Migration and Global Processes

As the buzzword of the last several decades, globalization is a deeply contested construct of ideas, theories, and processes. Often in public debates it is confused with the narrower notion of economic globalization, which, while central to the construct, is only part of it. And the global financial crisis highlighted the dangers of unregulated financial activity and overbearing debt in a world that has become less predictable, less controllable, and more risk-laden.

Globalization certainly implies a long-term trend of deepening interdependence between countries. For the optimists, globalization implies release from the shackles of traditionalism, colonialism, and communism, and national success is found in market forces, multiparty democracy, techno-scientific rationalism, national self-determination, and international co-operation. Pessimists such as Samuel Huntingdon with his theory on civilizational clash see a world in conflict, especially along political and religious faultlines. More critical approaches place the emphasis on disempowerment with the current modern world system bringing widespread violence and avoidable deprivation as core nations dominate and exploit peripheral countries. It is perhaps best seen as a series of global processes in which migration is at the core or close to the core.

### Global Cities and Migration

One such process is the emergence of the global city. Most migration types such as economic migrants, refugees, and agency and intracorporate migrants move to cities. As hubs and nodes in the global network, global cities stand at the center of globalization, which may not always be good for their rural hinterlands. The literature argues about the location and size of the global cities like London, Mumbai, New York, Osaka, Shanghai, Singapore, and Zurich, and sometimes a distinction is made between global and world-class cities. Many different lists have been produced. In any case, they contain the global, regional, or national headquarters of many transnational corporations, international banks, and other financial organizations; they are key national centers for economic activity, centers of research, and education and centers for fashion and high-quality arts performances. They are the hubs for all migrating types.

Good indicators as to whether a city is a globalizing city are the number of airports and the number of international airlines that fly in and the number of luxury hotels. These cities have a special relationship with the media outlets and they are key centers for the design of consumer products, often because they are more than usually populated by persons who are culturally and artistically innovative. They are of their nature highly cosmopolitan with culturally different persons represented at the different social strata, not least the third world immigrant population who meet the needs of the global culturally diverse working elite and the city's middle class in thrall to the elite. Globalizing cities are hubs for the multilayered strata of all migrating types.

### The Formation of Transnational Communities

Flowing from this has been another process – the growth in the global network of diasporic and transnational communities. The movement of peoples implies that all nations, certainly the developed ones, are becoming multicultural societies. All these people movements have led to the formation of very fluid or "liquid" multicultural and multifaith countries, even in countries whose population profile has historically been very monocultural such as Japan and the Republic of Korea, but driven to have migrant intakes usually because of low birthrates below the replacement level of about 2.2 children per fertile woman or the need for skilled and unskilled labor.

These transnational or diasporic communities are linked across the world and back to the home country by the new technologies and mass air transportation, ensuring that the links between the different hubs of the diaspora are maintained

and thickened. Within these links, a transnational ethnic economy can arise as does a transnational public sphere through common television channels or newspapers or websites or social media that are disseminated regionally or globally. These transnational bonds no longer need as much to be cemented by renewed migration but can be held together through cyberspace. These transnational hubs are thus multilocal and less subject to the impact of the nation. Among the different types of diasporas are the victim (the Armenians), the labor and imperial (the Indian indentured workers, the Italians), the trade (the Chinese, the Lebanese), and the cultural (the Caribbeans in France) (Cohen 1997). The phenomenon of transnationalism is tied to the logic of capitalist expansion but is at variance with assimilationism. These migrant diasporas acting transnationally can act on behalf of the interests of the homeland state or against the primary interests of the hosting states.

### The Politics of Identity

Migration has also been at the center of another global process: the politics of identity and the rise of extremist and religious reactions. The major part of the twentieth century was consumed by the ideological polarities of capitalism and communism. Their visions differed about the means of production, the role of the state and the distribution of resources. Each had their particular global network; sitting on the fence, not wishing to be aligned with either side, was a difficult task for many countries. With the end of the Cold War, a new politics emerged. It has been labeled the politics of identity though sometimes it is the politics of grievance or the politics of memory or the politics of retribution. Often it is consumed with conflict about cultural and religious differences, national origins, national identity, and national sovereignty. It has been seen in the Balkans, in Northern Ireland and Timor Leste. But the politics of identity is not often solved peacefully though it did happen in the case of Czechoslovakia. It has generated very significant backlashes across the developed world with the rise of exclusivist political parties, maintaining there is only one way of being an Australian or a Dutch or French citizen instead of expanding the national identity inasmuch as there are many diverse ways of being such citizens with hyphenated identities.

Out of the politics of identity, there has also arisen ethnic and religious extremism. White supremacist and antiglobalization movements are fundamentally about the politics of white identity and about the threat that globalization might reverse the world's power structures and their own personal and collective security. Islamic extremism can be seen as a politics of identity in response to exclusion by the West, as a politics of wealth generation and distribution, especially with the oil profits, as a reaction of fear that pluralism may lead to relativism and even to secularism and as a reaction to the Palestinian issue. Religion is also filling the gap as people are being separated from their longstanding local identities since we still live in a world that is very religious except in Western countries where secular humanism has rapidly grown.

## Global Migration Pathways

Migration experts usually distinguish between permanent and long-term temporary migration across international borders. The main permanent migration types are (1) economic and business migration, (2) refugee migration, (3) partner and family migration, and (4) retirement migration (such as British people retiring to Spain or Malta or Japanese to Australia or Thailand), while the major examples of long-term temporary migration are (5) international contract worker migration, (6) business executive migration, (7) international student migration, (9) international agency and government migration, and (8) nongovernment and intracorporate personnel migration.

The 2013 World Migration Report of the International Organization of Migration (IOM) gives two sets of estimates from the World Bank and the United Nations Development Program (UNDP) as to the breakdown of the 214 million migrants but almost half are from the poorer countries of the South to the rich countries of the North, Table 1). But well over a third are moving between countries of the poor South. Australia is, par excellence, the migration nation state as it

**Immigration and Globalization, Table 1** Global migration pathways (in percentages, $N = 214$ million people)

| Migration pathway | World bank figures | UNDP figures |
|---|---|---|
| 1. North–North | 17 | 15 |
| 2. South–South | 35 | 41 |
| 3. South–North | 45 | 41 |
| 4. North–South | 3 | 3 |
| **TOTAL** | **100** | **100** |

becomes a Eurasian nation in the twenty-first century – almost a quarter of its population is born overseas, and close to half (45%) are either born overseas or have at least one parent born overseas.

The financial situation of migrants in the North is worse than those of the native-born, but their situations improve with time as they achieve relative success and financial independence. Long-term North–North migrants, however, achieve the same levels of financial well-being as the native-born. South–South migrants are less well off financially than the native-born, and their expectations do not improve with time. For example, long-time South–South migrants are half as likely to say that their standard of living is getting better (32%) than the native-born (55%). Compared with what their situations would have been like if they had remained in their country of origin, North–North migrants gain in terms of objective and subjective economic indicators. South–South migrants, by contrast, appear to lose out relative to matched stayers, with long-timers being less able to afford housing. North–North migrants are less likely than South–North migrants to be struggling to meet their basic needs. South–North migrants also experience less improvement, over time, than North–North migrants. While migrants in the South are better able to afford food after being in the country more than 5 years, there is no such improvement with regard to shelter. In fact, they find it more difficult to afford shelter, compared with matched stayers in their home countries (International Organization of Migration 2013).

## Economic Migration

While the IOM figures remind us of the South-to-South movement, it is the South–North and the North-to-North movements which gain most attention in terms of statistical analysis, research studies, public debate, and public policy. Migrants on the move are motivated by their economic hopes and aspirations. Central to this are the G20 group of nation states in which 55% of the world's migrants, both temporary and permanent, reside, representing 129 million international migrants. Seven of the 19 G20 countries have more than 10% of their population as international permanent or long-term temporary migrants, led by Saudi Arabia (31.4%) where the overwhelming majority are contract workers on long-term temporary visas. As seen in Table 2, the other six countries are Australia (28.1%), Canada (20.7%), USA (14.3%), UK (12.4%), Germany (11.9%), and France (11.6%) (International Organization of Migration 2015a). The other important factors are common language (e.g., Argentina with Spanish), prior colonial links (e.g., France), proximity (e.g., India), and diasporic returnees (e.g., Japanese from Brazil and Peru).

### International Migrant Workers

Since World War Two, there has continued to rise the number of workers leaving their own countries to work in other countries such as the guestworker scheme in the Western European countries and in the Eastern European Communist countries in the immediate decades after the war. In 2013, according to the International Labour Organization (ILO), there were 150.3 million workers of whom 88.7 million (55.7%) were male and 66.6 million (44.3%) female. For the males, the labor participation rates are the same as for their brothers back in their home country whereas the female migrant workers had a far higher rate than their sisters back home (ILO 2015). The study found that 11.3 million workers, mostly women, were working in domestic service (cooking, cleaning, childminding, gardening).

According to the ILO statistics, exactly three-quarters of the workers were working in high income countries with almost half of the workers in Northern America (24.7%) and Northern, Western and Southern Europe (23.8%) with 11.7% in the Arab States and 9.2% in Eastern Europe. Further, 71.1% were in service

**Immigration and Globalization, Table 2** G20 countries versus number and percentage of overseas-born[a]

| Country | No. of overseas born | % of total population | Five largest source countries (in rank order) |
|---|---|---|---|
| Argentina | 1.89 M | 4.5 | Paraguay, Bolivia, Chile, Peru, Italy |
| Australia | 6.62 M | 28.1 | UK, New Zealand, China, India, Philippines |
| Brazil | 0.60 M | 0.3 | Portugal, Japan, Paraguay, Bolivia, Italy |
| Canada | 7.28 M | 20.7 | Not available |
| China | 0.84 M | 0.1 | South Korea, Philippines, Brazil, Indonesia, USA |
| France | 7.44 M | 11.6 | Algeria, Morocco, Portugal, Tunisia, Italy |
| Germany | 9.85 M | 11.9 | Former Soviet states, Turkey, Poland |
| India | 5.34 M | 0.4 | Bangladesh, Pakistan, Nepal, Sri Lanka, Myanmar |
| Indonesia | 0.30 M | 0.1 | China, Korea, UK, Timor Leste, Singapore |
| Italy | 5.72 M | 7.9 | Romania, Albania, Morocco, Germany, Ukraine |
| Japan | 2.44 M | 1.9 | South Korea, China, Brazil, Philippines, Peru |
| Korea (Sth) | 1.23 M | 2.4 | China, Viet Nam, USA, Philippines, Thailand |
| Mexico | 1.10 M | 0.5 | USA, Guatemala, Spain, Colombia, Argentina |
| Russian Fed. | 11.0 M | 7.7 | Ukraine, Kazakhstan, Uzbekistan, Azerbaijan, Belarus |
| Saudi Arabia | 9.06 M | 31.4 | India, Pakistan, Bangladesh, Egypt, Philippines |
| South Africa | 2.40 M | 4.5 | Mozambique, Zimbabwe, Lesotho, UK, Namibia |
| Turkey | 1.86 M | 2.5 | Bulgaria, Germany, Serbia, Greece, Montenegro |
| UK | 7.80 M | 12.4 | India, Poland, Pakistan, Ireland, Germany |
| USA | 45.7 M | 14.3 | Mexico, China, India, Philippines, Puerto Rico |

[a]Figures do not contain refugees claimants. Source: International Organization for Migration (2015a)

industries, while 27.8% were in more heavy industries such as manufacturing and construction and 11.8% in agriculture (ILO 2015). The Arab States have the highest proportion (35.6%) of migrant workers as a percentage of all workers in the national workforce followed by Northern America (20.2%).

Philippines, like India, has been a major sending country since the early 1970s and in 2013 the Commission on Filipinos Overseas estimated that 10.3 million Filipinos were permanent or temporarily overseas, 9.3% of all Filipinos. Of these, 4.21 million were workers on temporary visas, while another category were irregular migrants who were overstayers or whose presence was not properly documented. The major destination countries for Filipino workers were Saudi Arabia 948,038 (including 80,500 irregulars), United Arab Emirates 777,894 (42,805), Malaysia 767,573 (448,450), the USA 400,383 (271,000), Qatar 204,534 (15000), Kuwait (197,787 (6000), Hong Kong (187,843 (5000), and Italy (182,204 (54,390) (Commission for Filipinos Overseas 2016).

A substantial proportion of migrant workers work in situations of extreme exploitation, affecting their physical and psychological health. Female workers are more likely to suffer discrimination, exploitation, and physical and sexual abuse than the males. Aside from the often dangerous work situations, research has focused on the effect of migrant labor on gender roles and also on the children, usually but not always left at home. A recent new element is that IT connectivity has alleviated the factors of distance, isolation, and exploitation through the thickening of transnational links.

The International Convention on the Protection of the Rights of All Migrant Workers and Members of their Families came into operation in 1990 as a multilateral treaty based on the human rights of migrant workers. But it has had limited affect as it only came into force in 2003 after the threshold of 20 ratifying nations had been reached. The number by 2016 had reached 49, but none of the major destination states has signed the Covenant. However, many attempts by the sending nations in particular continue to foster

interstate dialogue and enhance bilateral, regional, and interregional cooperation. But the protection of migrant workers remains an uphill battle.

### Refugees and Asylum Seekers

As globalization theorists have warned for more than two decades, the numbers of refugees and asylum seekers have continued to rise. Refugee movements give clear witness to the inhumanity of humanity. However, the continuing failure to resolve the Palestinian refugee problem illustrates that serious dangers and critical issues are at stake with refugee movements. The refugee mentality is characterized by unique features that differ from other migration types. The push factors are so overwhelming that there is little choice but to flee. The social and political chaos is such that the concern is immediate escape with little thought given to the consequences. Most have not failed in their homeland but are successful, perhaps prominent and educated individuals with their families who flee because of persecution and become recognized as refugees in accordance with the 1951 U.N. definition of a refugee. Research has identified refugee opportunists whose lives are not in danger but who yearn for an economically better life. But the overwhelming majority of refugees are in genuine and rightful fear of their lives. It is the aim of UNHCR that all refugees will return home and most eventually do with the cessation of the conflict. When this becomes impossible, then resettlement in third countries becomes the priority.

Regarding refugees and asylum-seekers, the data held by the United Nations High Commission for Refugees (UNHCR) show the gradual rise in displaced people since the 1950s. At the end of 2015, there were 63.01 million people who were of concern, but the majority were internally displaced where they have become refugees in their own country. International refugees were 21.3 million at the end of 2015 with 16.1 million under UNHCR mandate and another 5.2 million Palestinian refugees under the mandate of the United Nations Relief and Works Agency (UNRWA) formed in December 1949. The top reception nations were Turkey (2.5 m), Pakistan (1.6 m), Lebanon (1.1 m), Iran (0.98 m), Ethiopia (0.74 m), and Jordan (0.66 m), while 53% of refugees were generated by three countries: Syria (4.9 M), Afghanistan (2.7 M), and Somalia (1.1 M). However, it is very important to note that the refugee profile changes very quickly, decade by decade.

### Stateless People

Another much overlooked problem is statelessness, which usually results from policies that exclude people considered as outsiders, notwithstanding their traditional ties to their territories (e.g., Myanmar's Rakhine state) or as a result of the transfer from colonialism to independence (e.g., the Burkinabe in the Ivory Coast). Many countries have not signed or become a party to the 1961 UN Convention of the Reduction of Statelessness. Statistics are very vague. The UN estimates that there are more than 10 million stateless people but it has only identified 3.387 million, with the three leading countries having stateless people being Nepal (800,000), Myanmar (797,000) and Thailand (542,000), while others are in countries such as Malaysia, Kyrgyzstan, Brunei, Turkmenistan, and Vietnam.

## Intermarriage and Family Migration

In the immediate post-WII period, partner and dependent child migration, including extended family migration, was seen as desirable and as an unmitigated right for those countries wishing to build up their population, less so for those countries with migrant worker schemes. With the more recent emphasis on high skill and business migration, there has been an accompanying backward shift, especially extended families. But as the IMPALA analysis has shown, since 1999 there have been greater restrictions placed on partner reunification but less restrictiveness in relation to children. Much greater stringency has been placed on the questions asked of both partners to obviate fraud and establish the bona fides of the relationship (Beine 2015).

In more recent times, intermarriage across international borders has become a growing phenomenon as a direct result of the mobility of

persons. Intermarriage, whenever and however it occurs, is usually an emotional topic. It was often taboo as, to quote a Chinese saying, "A chicken does not marry a duck". It implies the crossing of ethnic, religious, linguistic, racial, or national boundaries in life's most intimate union. The legal prohibitions against racial intermarriage in countries such as South Africa and in the United States have been well documented as have been the experiences of Japanese war brides in countries such as Australia and United States. Early studies pointed to the negative effects such as female exploitation, higher incidence of marriage breakdown and identity problems for the children whereas studies from the 1980s pointed to positive outcomes such as the rupturing of cultural boundaries and intergroup cooperation.

The incidence of intermarriages is partially embedded in population pressures, poverty pressures, imbalanced gender ratios which place a marriage squeeze upon either gender such as rural Japanese men and younger Filipino women in recent decades and massive changes in labor market demands. The so-called mail order bride, while a reality but overexaggerated by the popular press, led to many unhappy marriages (Cahill 1990) but formal and informal online dating subsequently arrived to broaden marriage partner selection. Data from both Filipino and Japanese government sources confirm that marriages between Japanese and Filipinos living in Japan are more numerous than for other source nations. Since the mid-1980s, the Commission for Filipinos Overseas has conducted guidance and counseling sessions for Filipinos going overseas to marry. In the 2005–2014 period, 214,093 Filipinos, mostly women, went to the USA (46%), Japan (18%), Australia (8%), South Korea (6%), and Canada (5%).

More recent research has focused on intermarriage and integration. As found before, intermarried couples are more highly educated and the foreign partner is better integrated than his or her fellow migrant nationals and new explanatory models have been developed (Torngren et al. 2016). Other research has targeted transnational families in developed countries, including cases where one or both partners work overseas and the children are minded by a grandparent or other relatives.

### International Student Migration

Another global process, very positive in aims and outcomes, has been the internationalization of education, including the exponential rise in cross-border education with the movement of persons such as professors, researchers, and students, the delivery of both academic award and short language and vocational programs and the diversification in educational providers beyond universities. In 1980, there were about 1.1 million internationally mobile students, whereas by 2009 it had risen to 3.4 million and by 2020 it will have grown to about eight million. Central to this has been the globalization of English.

Tables 3 and 4 show how the USA, UK, and Australia with their high-quality, English-speaking universities have been very successful in attracting international university students though they also recruit students into their vocational colleges and their schools as well as their English education institutes. The US continues to top the list but its swashbuckling gun culture is making many families hesitant in sending their young adult student children. Another trend has been the capacity of former colonial powers such as the UK, France, Russia, and Spain to attract students from their former colonial dependencies. Key Muslim states such as Saudi Arabia and Malaysia have attracted students from the Muslim world. Universities in countries such as New Zealand (18.7% of its students are from overseas) Australia (18.3%) and the UK (18.2%) have become financially reliant on the income from their internationally mobile student population.

However, both tables highlight the almost global ubiquity of the Chinese international student and how South Korea and Saudi Arabia are sending many of their students overseas for their studies or part of their studies. The student flows from European countries has been principally to other European countries but this has been driven by the European Commission with such programs

**Immigration and Globalization, Table 3** No. of internationally mobile university students versus host country (in rank order)

| No. | Country | No. of inbound students | Three largest countries of origin | Inbound mobility rate* |
|---|---|---|---|---|
| 1. | USA | 907,251 | China (291,063), India (112,714), South Korea (63,952) | 4.7 |
| 2. | UK | 428,724 | China (86,204), India (19,604), Nigeria (17,973) | 18.2 |
| 3. | Australia | 266,048 | China (90,245), India (25,562), Malaysia (15,357) | 18.3 |
| 4. | France | 235,123 | China (25,388), Morocco (25,223), Algeria (16,558) | 9.8 |
| 5. | Germany | 228,756 | China (23,616), Russia (9953), India (9896) | 7.7 |
| 6. | Russia | 213,347 | Kazakhstan (49,252), Belarus (24,880), Turkmenistan (15,662) | 3.0 |
| 7. | Canada | 152,244 | China (42,011), India (13,626), France (10,842) | n.a. |
| 8. | Japan | 132,685 | China (85,226), South Korea (14,958), Viet Nam (6071) | 3.4 |
| 9. | China | 123,127 | No data | 0.3 |
| 10. | Italy | 87,544 | Albania (11,429), China (11,318), Romania (7007) | 4.7 |
| 11. | U.A.E. | 73,445 | India (11,697), Syria (6169), Oman (6008) | 46.9 |
| 12. | Saudi Arabia | 73,077 | Yemen (8906), Syria (8448), Egypt (4560) | 4.8 |
| 13. | Netherlands | 70,692 | Germany (23,828), China (4717), Belgium (2460) | 7.3 |
| 14. | Austria | 67,691 | Germany (27,150), Italy (8064) Turkey (2536) | 15.9 |
| 15. | Malaysia | 60,244 | Bangladesh (6534), Indonesia (5700), China (4956) | 7.4 |
| 16. | Ukraine | 57,583 | Turkmenistan (13,485), Azerbaijan (9257), India (3925) | 3.2 |

## Migration and Public Policy

International and national migration and refugee policies which inevitably intersect with population policies and with settlement and integration policies are usually based on the premise that population movements and international migration can be actively and responsibly governed and managed though in the case of refugee and asylum seeker movements the policies are much more reactive than proactive. Many think tanks across the developed world are engaged in monitoring, evaluating and designing policies and programs of all aspects of population flows. There has been much focus on financial and labor market impacts and on settlement and acculturation

**Immigration and Globalization, Table 4** Number of internationally mobile university students versus sending country (in rank order)

| No. | Country | No. of outbound students | Three largest countries of destination | Outbound mobility Rate[a] |
|---|---|---|---|---|
| 1. | China | 790,850 | USA (291,063), Australia (90,245), UK (86,204) | 0.8 |
| 2. | India | 233,540 | USA (112,714), Australia (25,562), UK (19,604) | 0.7 |
| 3. | Germany | 115,513 | Austria (27,150), Netherlands (23,828), UK (13,846) | 3.9 |

processes as well as the impact on social capital and social cohesion. Inevitably models and theories have emerged.

Migration states such as Australia, Canada, and New Zealand have developed highly engineered immigration policies designed to boost population across their unpopulated spaces as well developing their secondary industries in their urban centers in the immediate post-WWII period. Countries such as France and Germany from the 1950s in their post-War recoveries were driven by their guestworker programs for unskilled and semi-skilled workers. Such programs were then succeeded by the international contract labor movements beginning mainly in the 1970s following the oil crisis. This flow, led by the Filipinos, was directed very much towards the oil countries of the Middle East.

An important cross-national study with the aim to comparing immigration policies has recently reported on admission and citizenship policies across nine countries (Australia, France, Germany, Luxembourg, the Netherlands, Spain, Switzerland, the United Kingdom, and the United

States) focused around economic migration, family reunification, asylum, and humanitarian migration and student migration as well as acquisition of citizenship. The IMPALA (International Migration Law and Policy Analysis) database project has been mapping "tracks of entry" (Beine et al. 2016).

The project has found that in the first decade of the millennium (1999–2009), entry requirements became much more complex across all migrating categories and with substantial variation in the restrictiveness of immigration regulations. The variation in entry policies varied quite markedly across the different categories, e.g., Australia's entry for policies for skilled economic migrants and for international students is very liberal, whereas its entry policies for asylum seekers, especially if they arrive by boat, are the most draconian of all nine countries. Hence, generalizations about immigration policies are hard to make unless one examines the particular migrating categories. The IMPALA data are characterized by regulation density (Beine et al. 2016). As the global economy has allowed for the greater flow of goods and services, it has also allowed for the greater flow of people but under much greater stringency regulations as we have seen with partner migration.

## Migrant Smuggling and Human Trafficking

National policies, however, have struggled to deal with border control and the smuggling of people. In a comprehensive review of the evidence, the International Organization of Migration has admitted that "the smuggling of migrants across international borders on routes traversing land, air and sea continues to undermine migration governance and impedes safe and orderly migration. In numerous parts of the world, migrant smugglers have become an integral part of the irregular migration journey, resulting in enormous profits for criminal smuggling networks while reducing the ability of States to manage their borders and migration programmes. Given that it is often covert in nature, migrant smuggling may only become visible when tragedies occur or emergency humanitarian responses are required" (McAuliffe and Laczko 2016, p. 3). It is rife with exploitation, abuse and inequity. It is estimated that over the last 20 years, 60,000 smuggled immigrants are dead or missing (Brian and Laczko 2016). The same review, while acknowledging the research progress, admitted that we do not have a clear picture of global people smuggling.

Contrary to the portrayal of smugglers in the Western press as evil misdoers and in the Asian press as snakeheads, the intellectual framing of migrant smuggling can be otherwise described as providing a service, acting almost like tourist agents and facilitating the entry of people into their destination country. Some would frame it even altruistically when there is no profit motive and the fleeing migrant is escaping persecution or war.

While there is much overlap, human trafficking differs from people smuggling since it involves coercion. Nonetheless, the UN Office on Drugs and Crime (UNDOC) (2016) has brought to global attention the adaptability of smuggling organizations and their increasingly sophisticated networks, the role of the corrupting of government officials and the vulnerability of smuggled migrants. International criminal syndicates have added migrant smuggling to their portfolio of criminal activities. Europol in its 2017 threat assessment reported that in Europe smuggling had generated EUR 4.7–5.7 billion in profit. They had shown great versatility in the means of transport, concealment, and technologies used. The quality and quantity of forged fraudulent documents had increased. Also on the increase was the smugglers' abuse of legal channels such as sham marriages, bogus paternity, false employment contracts, fake invitation letters, false medical visas, and false claims of being victims of trafficking or refugees (Europol 2017).

UNODC estimated that in the 2-year period (2012–2014), 63,251 trafficked victims were detected in 106 countries with 42% of these trafficked domestically. More than 500 different trafficking flows were identified, usually paralleling migration flows. While sexual exploitation and forced labor are the most common reasons, other reasons were forced or sham marriages, the selling

**Immigration and Globalization, Table 5** Profile of trafficking flows according to geographical region

| Geographical Region | No. of traffic flows* | % of sexual trafficked | % of children trafficked |
|---|---|---|---|
| Sub-Saharan Africa | 69 | 29 | 64 |
| East Asia/the Pacific | 64 | 61 | 32 |
| East Europe/Center Asia | 56 | 31 | 8 |

of children, the removal of organs, the recruiting of child soldiers, and forced begging. Trafficking arises out of the vulnerability of people, who are often escaping war and persecution as well as poverty, and armed groups often recruit children as combatants. While in recent years, the number of trafficked men has increased to 21%, the most trafficked are women (51%) and children (28%), girls (20%) more than boys (8%) who are forced to work particularly in the mining and fishing sectors and work as porters or as slave (UNODC 2016). By 2016, 158 countries had criminalized most forms of trafficking though there have been few convictions.

Traffickers generally come from the same country, speaking the same language and from the same cultural background. A recent trend is the rise of female traffickers as "the significant share of women offenders is remarkable as there are few crimes with such high levels of female participation" (UNODC 2016, p. 31). However, as Table 5 shows, there are different trafficking patterns across the different regions of the world. The number of trafficking flows was highest in sub-Saharan Africa with a quite high percentage of children trafficked. The sexual trafficking of mostly women and girls is a feature of the Western and Central European, East Asia and the Pacific and the Central America and Caribbean profiles.

## Conclusion

There is a strong intersection between globalizing and migration processes. And both sets of processes inevitably impact at the local level. And both have become much more complex as migration both in the sending, transitory and receiving countries must be contextualized in the multifaceted local context. For the vast majority of migrants, the risks are surmounted and they become acculturated to varying extents in their adopted countries through developing cultural and linguistic competences, thereby enriching their new sociocultural milieu.

## Introduction

The United States has traditionally been a country of immigration and immigrants. At the same time, the United States has viewed various waves of immigrants with trepidation, fear, protectionism, and nativist response. Nevertheless, the United States has shown remarkable resilience in the capacity of the culture and economy to absorb newcomers.

Since the founding of the Republic, immigration policy can be divided into five broad phases. Over that time the face of immigration to the USA changed from primarily European countries to countries throughout Asia, the Indian subcontinent, and the Americas. Immigration has been and continues to be a source of policy conflict (LeMay 1987: 6; Zolberg 2006: 10). While migration waves ebb and flow over time, the USA has received approximately one million legal migrants per year since the end of the Cold War. The following entry will provide a broad historical survey of US immigration policy from the nation's founding up until the present day.

## Phase I (1780–1880): Laissez Faire

Between 1780 and1880, neither qualitative nor quantitative restrictions were imposed upon immigrants wishing to enter the USA. There was little need for restrictions since most migrants were homogenous being Protestants from Great Britain. As immigrants began to come from other countries with different cultures, the processes of acculturation of these new arrivals differed vastly. In any case, though, these immigrants came overwhelmingly from Northern and Western Europe. The wave of Catholic immigrants coming during the 1830s and 1840s set off a dramatic antiforeign reaction, the latter becoming easy targets upon which to blame for problems of a rapidly changing American society during the period of urbanization and industrialization. During this time, various nativist movements arose.

In the 1850s, nativism became an open political movement. Secret patriotic societies such as the "Order of the Star Spangled Banner" were founded and eventually grew into the "American Party" whose members were pledged to vote only for Anglo-protestant candidates, to demand a 21-year waiting period before naturalization, and a pledge to fight Roman Catholicism. "No other xenophobia functioned in so highly organized a way as anti-Romanism" (Higham 2002: 79).

## Phase II (1880–1920): Qualitative Restrictions

The influx of Chinese immigrants to the West coast and the changing demographics of immigrants to the East Coast – from Southern and Eastern Europe – created new political pressures for restriction leading to the establishment of a qualitative immigration policy based upon certain exclusionary categories. During the 1870s, the ascent of the anti-Asian "Workingmen's Party" on the West coast effectively lobbied for Chinese national exclusion. To the East, a similar nativist movement was formed which, as its central goal, was to limit the "alien races" of Southern and Eastern Europe. Founded in Boston in the mid-1880s the "Immigration Restriction League" actively lobbied Congress to establish literacy requirements upon immigrants wishing to enter the USA. Although vetoed by President Cleveland in 1897, the latter was eventually put into law with the passage of the 1906 Naturalization Act.

Beginning in 1882, qualitative limits were introduced in the form of the Chinese Exclusion Acts. During the 40-year period leading up to the passage of the 1924 National Origins Act, the USA experienced its most dramatic growth as a result of immigration. Between 1880 and 1920 approximately 27.5 million came to the USA. In the 10-year period 1900–1910, 8.7 million persons migrated; 1.3 million were admitted in 1907 alone. As a result of the migrants more "alien" characteristics, i.e., skin tone, physiognomy, Slavic and East European origins, and beliefs (Judaism), fears were aroused that these new immigrants would be unable to assimilate into American society. A surge of pseudo-scientific studies by sociologists and biologists assailed the newcomers as racially inferior. In 1911, a 42-volume report was issued by the Joint Commission on Immigration – The Dillingham Commission Report – which purported to demonstrate the inferiority of the new immigrant races and blamed them for a host of societal ills (King 2000: 64). Despite the mounting forces of restriction, the "pull" factors of a rapidly industrializing the United States with "push" factors from Southern and Eastern Europe were too strong to limit large-scale migration. Stagnating agrarian-based economies, religious and ethnic persecution in the form of pogroms against Russian and East European Jewry was too strong and, with the exception of Asian exclusion legislation, immigration went largely unchecked until the 1920s.

## Phase III (1920–1965): Quantitative Restrictions

The passage of the 1924 Johnson-Reed Act, more commonly known as the National Origins Act, changed all of that. An annual limit of 150,000 Europeans was set; no Japanese were allowed; visas were based as were the number allowed for all regions to quotas except Northern and Western Europe (Fuchs 1983: 301). As noted, the 1924 Act placed limits (quotas) on immigration from all regions except Europe. The quotas were based on the percentages of foreign-born persons in the United States derived from 1920 census records, which due to racially discriminatory policies of the past, and to a lesser extent, labor market demands, were low for all groups but Europeans. Thus, the 1924 Act ostensibly was "fair" based on the numbers residing in this country but actually "unfair" because policy and practice preferred Caucasians over all other groups of foreigners. The votes for the 1924 Act were as follows: 146 Democrats joined 162 Republicans in the House, and 33 Democrats voted with 35 Republicans in the Senate to pass the bill. Only 62 House members and 9 Senators opposed the measure.

This new restrictive policy, coming on the heels of the Great Depression, dramatically reduced immigration into the USA for nearly three decades. Indeed, during the 30-year period of national origin quotas, the USA accepted only four million immigrants. Parenthetically, during this period of immigration constraint, Congress created the border patrol in 1925 as a way to halt unauthorized migrants of which an estimated 500,000 entered in the 1920s (Zolberg 2006: 266).

It was not until the advent of World War II that any pressure for change in policy occurred. With

the outbreak of war in Europe and the growing involvement of the United States in that war, labor became a more valuable commodity, particularly agriculture. With war mobilization and the consequent demands on manpower, it soon became apparent that the United States government would formally approach its Mexican counterpart on the question of imported labor.

During World War II, the USA eased entry for manual labor from Mexico known as the Bracero Laws. As a result, admissions peaked at 62,000 in 1944, less than 2% of America's four million hired workers (Calavita 1994: 60). Furthermore, in response to the war-time alliance with China, Congress repealed the 60-year ban on Chinese immigration. It also passed the War Brides Act of 1946 to handle the problems of soldiers who had married overseas enabling some 120,000 immigrant wives to rejoin their husbands in the USA. Finally, as news of Nazi atrocities became publicized, President Truman issued a directive admitting 40,000 war refugees. Partly as a result of the inflexibility of the national origins quota system, the government had to resort to temporary measures to meet emergency immigration situations. In 1948, for instance, Congress passed the Displaced Persons Act, which allowed more than 400,000 people made homeless by World War II to migrate to the United States (Ueda 1994: 36–37).

The first major piece of postwar legislation came with the passage of the Immigration and Nationality Act of 1952 also known as the McCarran-Walter Act. The 1952 Act preserved the national origins quota and established a system of preferences for skilled workers. Furthermore, it also encouraged a strengthening of family ties by giving preference to US citizens.

With the onset of the Cold-War, additional refugee measures were enacted by Congress as allowed under the parole clause found in the 1952 Act which authorized the Attorney General to admit persons in emergency situations. The first of these came in the form of the 1953 Refugee Relief Act which admitted over 200,000 refugees outside of existing quotas. Legislation passed in 1957 permitted approximately 30,000 Hungarian "refugee-escapees" displaced by the failed 1956 revolution to enter the USA – the 1957 Refugee Escapee Act. Under the new Act, a refugee-escapee was defined as any alien who fled from any communist country because of persecution or fear of it. The parole clause also was used to admit more than 650,000 Cubans in the early 1960s; Czechoslovakians in the aftermath of the 1968 revolution; Chileans after 1973; and more than 400,000 Indochinese by the late 1970s following the fall of Saigon.

## Phase IV (1965–1996): The Expansive Phase

One of the most widely sweeping changes in the history of USA immigration policy came with the passage of the 1965 Immigration and Nationality Act. The Act introduced four basic policy changes which clearly reflected the Civil Rights era just as the 1952 Act reflected the Cold-War era:

1. The abolition of the national origins quota system.
2. The introduction of a new preference system based upon family reunification.
3. The institution of individual labor clearance procedures: economic skills.
4. Refugees.

The 1965 Act abolished the national origins system replacing it with an overall total of 160,000 with a 20,000 person limit per country for all nations outside the Western Hemisphere. Second, it capped immigration from Western Hemisphere countries at 120,000 without individual national limits. Immediately afterward President Johnson declared the United States would welcome any Cubans who wished to flee Castro's Communist state. Hundreds of thousands did so leading Congress to pass the Cuban Adjustment Act of 1966 (Zolberg 2006: 350). Furthermore, in response to pressures as a result of unauthorized immigration, Congress passed in 1976, an amendment to the 1965 Act that created a worldwide uniform immigration system applying the 20,000 per-country limit to both hemispheres. Additionally, instead of "blanket revisions" special parole programs also were implemented to handle Cuban, Vietnamese, and Soviet Jewish Refugees many of which are still in practice.

## 1980 Refugee Act

By the 1980s concern over rising immigration from Latin America, the Caribbean Basin, and Asia, growing numbers of undocumented workers, and increased demand for entry by asylum seekers and refugees forced Congress and the White House to question immigration policy. Between 1980 and 1990, three pieces of immigration legislation were passed which continued the expansion of immigration which began with the 1965 Act. The Refugee Act of 1980 was the most wide-sweeping legislation of its kind. Under the 1980 Law, Congress benchmarked an annual refugee figure. Hitherto, refugees were admitted on an ad hoc, emergency basis. The 1980 Act was significant in the area of a rights-based policy. It established a national policy guaranteeing continued refugee admissions and defined the term "refugee" along the lines of the Geneva Convention. This was a departure from the largely ideological, anti-communist grounds that previously prevailed. The Act furthered grounded the principle of asylum in US statutory law and permitted resettlement assistance for refugees (Martin 2011: 227–228).

The act provided a permanent and systematic procedure for the admission of refugees of special humanitarian concern to the USA and to provide comprehensive and uniform provisions for the effective resettlement and absorption of those refugees who are admitted. The definition of refugee was also revised to conform with the U.N. Convention and Protocol Relating to the Status of Refugees, and the geographical and ideological limits of the previous law were limited. Under the Act's definition, refugee status is based on persecution or a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion.

## The 1986 Immigration Refugee and Control Act (IRCA)

As Susan Baker (1990) noted, "IRCA underscored the political tension between those who supported immigration reform as an opportunity to implement a generous legalization program and those whose primary agenda was tightened enforcement" (p. 3).

The market-oriented expansionism came in the form of replenished farm labor to replace those who left agriculture allowing these new workers to enter the USA as temporary residents. The Act offered a State Legalization Impact Assistance Grants (SLIAG) program to reimburse states for some of their increased welfare, education, and administrative costs because of potential participation in those programs by authorized migrants. IRCA also provided an expedited procedure for employing foreign workers if the Labor Secretary determined that available US workers were found by the employer not to be qualified (LeMay 1994: 56–57). The Law also required all employers to verify the documentation of foreign laborers or face monetary sanctions and in certain cases incarceration (Calavita 1994: 65). The expansionist part was an amnesty to some 2.7 million undocumented migrants who have lived continuously in the USA since January 1, 1982, or, who as unauthorized migrants, resided and worked at least 90 days in the USA during 1985 and 1986. The Act also provided permanent resident status for Cuban refugees (*Marielitos*) who entered the country before January 1, 1982.

The legacy of IRCA is one of unintended consequences. Rather than making illegal immigration more difficult, for instance, it has had the opposite effect. Before IRCA, illegal labor was often referred to as undocumented illegal labor. Since the passage of the Act, fake identity papers became so widespread and inexpensive that these migrants were referred to as documented illegal labor (Calavita 1994: 70–71). Furthermore, in regard to Special Agricultural Workers (SAWs), the Act provided temporary resident status for up to 350,000 aliens who could prove that they lived in the country for at least 3 years had worked at least 90 days in American agriculture in each of those 3 years. They could adjust to permanent resident status after an additional year, or within 3 years of enactment. After IRCA was passed, SAW applicants totaled 1.3 million (Lemay 1994: 57; Martin 2011: 215).

The expansive nature of the 1986 Act was a particular windfall for Mexican immigration.

Whereas in the decade prior to its adoption a total of 640,000 Mexicans legally immigrated to the USA, with passage of IRCA some 1.6 million legally immigrated between 1987 and 1989. Furthermore, an additional 1.2 million Mexicans legally immigrated to the USA between 1991 and 1993 for a total of 2.8 million legal admissions in a 6-year period (U.S. Immigration and Naturalization Service 2000).

## Immigration Act of 1990

Congress continued refining immigration policy by increasing total immigration under an overall flexible cap of 675,000 immigrants beginning in the fiscal year 1995. The overall cap, however, included limitations. The 675,000 level to consist of 480,000 family-sponsored; 140,000 employment-based; and 55,000 "diversity immigrants" (Martin 2011: 217–218). It also revised all grounds for exclusion and deportation, significantly rewriting the political and ideological basis. Further the Act repealed the bar against the admission of Communists as nonimmigrants and limited the exclusion of aliens on foreign policy grounds. The Attorney General was authorized to grant protected status to undocumented alien nationals of designated countries subject to armed conflict.

## Phase V (1996–Present): A Return to Restrictions

The refinements included in the 1990 Immigration Act were not enough to control increasing numbers of immigrants coupled with an increasingly vocal level of intolerance in the USA. By 1996, Congress reacted with a series of restrictive laws governing immigration. The Personal Responsibility and Work Opportunity Reconciliation Act; Illegal Immigration Reform and Immigrant Responsibility Act; and Anti-Terrorism and Effective Death Penalty Act all illustrate a shift toward more restrictive policies (Martin 2011: 252).

The Personal Responsibility and Work Opportunity Reconciliation Act (PRWOPA) dramatically altered the current welfare system and under Title IV restricted the access of authorized and unauthorized immigrants to a wide range of public benefits.

The Illegal Immigration Reform and Immigrant Responsibility Act (IIRIRA) added to and amended sections of the Welfare Act. Among other provisions, IIRIRA changed the public charge inadmissibility standard for prospective immigrants and greatly strengthened the financial responsibility of petitioners for family-based immigrants as well as for some employment-based immigrants (U.S. Immigration & Naturalization Service 1997).

Finally, under Title IV of the Anti-Terrorism and Effective Death Penalty Act (ATEDPA), greater discretion is given to inspectors to deport immigrants without due process found to be in the US proper documentation. Obviously, these requirements severely restrict a judge's discretion to waive deportation requirements on a case-by-case basis. Since the adoption of ATEDPA, some 300,000 unauthorized immigrants have been deported. Many must now wait at least 5 years before being eligible for reentry, whereas many others are denied entry permanently.

The attack of 9/11 had far-reaching effects on how the USA approached immigration. By 2003 the Immigration and Naturalization Service was merged with the newly created Department of Homeland Security (DHS) and is now known at the US Citizenship and Immigration Services (USCIS). The DHS is now the principle federal agency responsible for border control to include adjudicating refugee and asylum claims. Depending on the applicant, this process can last several months even if the asylum seeker has established a credible fear of persecution has family ties in this country and poses no security risk.

On May 11, 2005, President Bush signed into law the Real ID Act of 2005 which makes it easier for an asylum seeker without corroborating documents to be denied asylum a move contrary to international law. Further, the Law requires states to meet Federal ID standards. Under Title II of the Act beginning in 2008 state motor vehicle agencies are to deny driver's licenses to any individual who cannot demonstrate they are here legally thereby, turning motor vehicle employees into de

facto immigration officials (Harris 2005). Since the Real ID Act of 2005, no major piece of immigration legislation has made it to the president's desk.

## Conclusion

Immigration policy has since held steady in a frozen status with bills and recommendations stored in the bowels of congressional committees. A general exclusionary zeitgeist has gripped the country with no signs from the newly elected Trump administration to reverse or ease exclusion. Rather, just the opposite has occurred as is evidenced with the ending of the Obama era Deferred Action for Childhood Arrivals (DACA) which removes deportation protection and work permits for an estimated 800,000 undocumented childhood arrivals. Yet, despite these exclusionary measures, immigrants and refugees continue seeing America as a promise of a better life thereby leaving state and local governments to construct their own policies. As laboratories of democracies, state and local governments have been forced to experiment with a wide range of policy options, not by choice but by necessity. Should the White House and Congress not agree on comprehensive immigration reform, state and local governments will continue to carry the burden having no alternative but to muddle through.

## Synonyms

Asylum policy; Immigration policy reform; Migration policy

## Definition

Immigration policy in the European Union (EU) has been characterized by a tension between Europeanization and free-flow of citizens on one hand and the difficult internal context of member-

states, informed by political realities and the identities of the nations themselves. This may be understood as led by elite discourse, which may be ineffective in accomplishing goals that serve the needs of at-risk migrants and asylum-seekers.

## Introduction

EU pressure upon member states in areas of immigration policy and its reform has found a strong offset in in-state policy considerations. Policy has stressed stronger external borders, yielding approaches that favor military and security measures (Butler 2018), migration within the EU as a security matter, and regulatory factors that observe "pull" of certain nations for migrants. The intent for *Europeanization*, "attributed to European integration" (Costello 2006, p. 287) of migrant and asylum policies, and its free-flow of EU citizens and families stands in contrast with the states' internal realities, particularly those that rest on identity and stemming the flow of migrants.

The EU approach has coalesced around a defined grouping of rights and permissions; still, immigration policy reform is not a one-dimensional consideration, dependent on separation between states' ideals and the direction and objectives of the EU as a standardizing body. Because states may evidence a trend toward isomorphism as a group and with EU regulations, it is worth reviewing trends in research in this area, particularly since EU policy has not been entirely successful in addressing the multifarious demands placed upon it. The simple adoption of policy, from above or from a peer group, in policy areas heavily dependent on historical considerations and present context, may fail to lead to desired or expected positive outcomes. To the extent that such policies marginalize disadvantaged groups, widely considered at-risk, instituted policies as the result of elite discourse may betray a basis in more questionable or even immoral assumptions, limiting inclusiveness, participation, and the prospect of positive societal contributions from migrant communities.

This chapter considers the need for greater attention to the interaction of EU immigration policy directives and elite-led discourse that occurs within member states, as consequential to the eventual success or failure of immigration policy and its reform. On one hand, policies have a clear need to be seen as accountable to the needs not only of migrants and those seeking asylum but also to the international community; on the other hand, EU policies that contravene issues of states' perspectives and demands to address their particular realities in the most efficacious way possible may (1) not be implemented as expected or work as desired and (2) fail to involve local populations in the setting of policy, and thus potentially lead to division and unrest. Specifically, the involvement of elite influences, compared with popular, public viewpoints and the perspectives of migrant groups and asylum-seekers, may be reviewed through analysis of the discourse that leads to problem definition and program design, and how that may fail to achieve outcomes that serve both citizens and at-risk individuals.

## Context and Current Research

Migration, "the movement of people" (Garcia-Zamora 2018, p. 1), can be understood as a response for populations to a variety of considerations and crises; it can be forced or voluntary, with refugees forming a particularly at-risk segment of the larger community of migration, given their tenuous status and fleeing persecution or threat of violence as a rationale for movement. While migration is not new, migration policies have become more fractious in recent years. There are normative views of the advantages of migration – the increase of diversity, for example, as a general positive point, though citizens increasingly express irritation that diversity has not improved their nation as a place to live (Garcia-Zamora 2018). Harmonization has been described as a shaky goal, as restrictions in one nation may be observed in others (Costello 2006), indicative of potential for bottom-up definitions that come into conflict with EU interpretations. The usefulness of foreign workers to help businesses and economies reach their financial goals is

a more easily documented need, but usefulness does not necessarily lead to acceptance.

Even as the nations of the EU have determined common principles for free-movement of populations within the union, consistency in approach to migrants from nations outside the EU is lacking. Further, the impositions from above in the EU may pose points of disagreement within nations, and encroach upon sovereignty, however defined and defended in a particular instance. Because the nations of the EU have had such different experiences within migration historically (Comte 2018, covers this aspect well), there is a need to consider national-level discourse and in particular the views, made clear through policy development and compromise, of powerful elites. As an added point, with the possibility of great disagreement between nations and EU governance on migration policies, the value of EU "shared values" policies, if they cannot directly influence national level outcomes, may be symbolic. This is insufficient for a system that has been described as stressed and overwhelmed (Garvey 2018).

Immigration reform may be considered through lenses of ethics and morality. As the EU recognizes the issues posed by migration, especially from war-torn areas, official guidance and programs are created but may be constructed in a manner where benefit to the client community is unclear. In those instances, migrants may persist in approaching illegal channels of movement. From an angle of popular participation, prejudices may exist that are not supportable when analyzed but nevertheless are perpetuated (Garcia-Zamora 2018); they may be disseminated and maintained in the popular discourse by elites, because the public's acceptance and adoption of such views keeps some groups marginalized, and the majority stabilized. This is possible even in situations where the work of migrants is recognized as positive, such as for high-skilled occupations (Cerna 2018); while work is valued, the presence and contributions of migrants are considered suspect.

Programs are driven by the value judgments of their creators. Essential in defining program intents in the political realm is a strongly felt, rationalized impulse; if the impulse rises to the place of myth – taken as fact without being challenged – then so much the better. For example, Thielemann and Schade identified several myths that inform popular immigration policy discussion: "first, that migrants choose destination countries predominantly because of their generous welfare benefits; second, that countries like the UK are uniquely and significantly adversely affected by immigration; and third, that restrictive measures can easily and substantially reduce the number of migrants" (2016, p. 140). The ability to document the nature of a problem or prove it in any way is not the issue – the issue is whether the portrayal of the problem, and the construction of the image, resonates with the public. Programs themselves do not have to achieve outcomes as long as it looks like positive movement is made. "If you cannot change a situation, the next best thing is to make it look as if you are" (Bove 2014, p. 122). Steadily, policy efforts have become as theatre, with portrayals of action and outcomes considered as worthy as authentic progress.

Vaughan-Williams (2015) highlighted views of migration through considerations of EU directives, notably bordering practices as immunitary and the construction of the internal/external narrative via frameworks of engagement, such as thanatopoliticism, animalization, and medicalization. One may take from this the creation of a topography of preferred versus disfavored, regular and irregular, legal and illegal, and so forth. The result of policies supposedly intended to protect at-risk groups might instead act as a dehumanizing force, or even lead to deaths of vulnerable people. The oversimplification of a complex, society-changing discussion is largely elite-favoring – if accepted, such simplified viewpoints allow maintenance of elite power, while not requiring large outlays of resources for administrative measures. It may be that welcome, and assimilation that is not destructive to the identities of migrants, is not had because it is not desired by elite groups. Inclusion may not serve societal needs from an elite perspective, even if the result is disorder, hate, and suffering.

Elite viewpoints articulating a state interest may fail to consider that the proportion of the population that may be affected by migration

directly has gone up, and that simple, even time-honored, approaches to policymaking may fail to account for the gravity of the situation. "Migrant choice" is limited as a factor for discussion in favor of state preferences, which may also include what the state can reasonably offer given limitations on resources (Garvey 2018). Legitimacy of policy measures in this area may rest on whether government is seen as protecting citizen interests, even though the context itself is changing – not only with competition for jobs, but the jobs themselves, in function, and required education and experience. It may be that it is easier to engage in rhetoric that signifies protection of an existing way of living, when that way is already being subsumed by a host of factors. In this respect, elite views at the national level may tend toward unsophisticated descriptions of the policy context because those achieve particular goals. The elite maintains itself through a certain selectivity in decision and nondecision; even as much of the goal of the elite is to maintain its power, it must still gather enough legitimacy from the mass to seem as if it is accountable (Farazmand 1999). Reform is always on offer; as attention is given to base explanations of complex issues, which is satisfying to a certain segment of the population, there is always a chance that the matter may be more fully and properly resolved. On the international level, local talking points cannot resolve issues that are deeply complex – and so a divide exists. While "demoicratic ideas of trust and no othering, whose traces can be evidenced in the architecture of European citizens' free movement, may also help interpret the distinctive narratives that European citizenship weaves in the field of immigration and nationality" (Strumia 2016, p. 419), this is perhaps far-afield from the immediate realities and needs of individual nations. Shared values across nations may take a secondary position to political survival, let alone political success.

## Public Influences and Elite Discourse

Elite influences saturate political science. As Harold Lasswell observed, "the study of politics is the study of influence and the influential. . .the influential [elite] are those who get the most of what there is to get...[and] the rest are mass" (quoted in Dunleavy and O'Leary 1987, p. 137). Further, keeping the running of government to a small group of influential people would, in the elite view, be preferable to involvement by the masses; elites would be more able to respond to complex issues and organize bases of power to achieve desired ends. That attention to the views of the masses would be a fictional, illusory matter, useful to keep society stable, and necessary to avoid greater discussion of the imposition of preferred forms of order on society, is a major consideration within elite theory. Instead of providing venues for popular participation, government and administration are a mechanism for assuring full imposition of the elite view, creation of meaning primarily within those narrow bounds, and selection of representing agencies for the masses through liberal corporatism, further distancing the public from the objectives and work of public life. The connection between various forms of elite – from government to military to commercial – weaves a dense web, which allows domination of the masses, and creation of narratives that usefully pit segments of the population against one another (Dunleavy and O'Leary 1987). Yet, it is difficult to know, without further analysis, whether and in what ways the outcomes from such a system are suboptimal, and what exactly is being lost by favoring an elite viewpoint over popular standpoints, which may differ significantly.

As Thurlow and Jaworski suggested, the word elite is also "a quintessential floating signifier" (2017, p. 243). In the case of policy analysis, one might be most interested in how policy differentiates one group from another and emphasizes superiority or other distinction. When policy leaves the place of rhetoric and becomes written law through legislation, it becomes a statement with the resolve to act as fact, even though it may be simple opinion, and not provable. The positioning of one group as "non-elite" in some respect is a purposeful move in the public sphere, even as the rationale might be taken as given by the majority of the public (Thurlow and Jaworski

2017). There is a defining of a dividing line between what is and what is not, between those who rule and those who are ruled, within the span of the statement and popular agreement (or at least, lack of dissent) with it. The ability to control the apparatus of public policy, through the definition of the problem and determination of its solution, has impact on both societal currents and the getting and maintaining of personal political power. By focusing on the subject group (in this case, migrants and asylum-seekers) and illustrating them and their predicament in various ways, elite groups make meaning, which becomes tangible in the construct of law but also shows sensibilities on the matter that might otherwise be obscured.

## Elite Discourse and Effects on Public Policy

Public policy choices are human constructions raised through a process that essentially creates, external from problem definition and solution creation/implementation, a substance with a spiritual component. There is no need for identifying the being of a problem and corresponding policy solution if the nature of the interaction between the two is external from consciousness, unable to be apprehended by us as common citizens. Solutions require certainty or at least a pretention to it, as well as a clarity of understanding about the nature of a problem. The public looks to government elites to espouse such certainty. We might see the coming of policy solutions as phenomena of the coming of a peek at real consciousness and the absolute translation of thought and power into transcendent action – a setting aside of the individual, even though the individual figures heavily in the divining not only of solution choices but of problem definition itself (Hegel 1977, orig. 1807). The EU may see its attempts at immigration policy reform and harmonization as transformative, evidencing a spirituality and belief in a more right and just tomorrow. More likely, though, solutions as they are enacted in member-states represent individual elite inclinations and compromises between powerful people in political environments. Even where there is alignment with EU policy, there are reasons that support a narrative of power and its maintenance.

In defining basic overall tenets for asylum-seekers and migrants, the EU is voicing an elite discourse that is informed by a broad basis of expectations: organizational, international, rooted in interpretations of what is most ethical, and less from a utilitarian perspective, *possible* given resources available. The union speaks for its member states, and dictates to them general expectations or anticipations for proper behavior with regard to immigration policy, but cannot speak directly to the internal realities of the member states. There, another layer of meaning-making occurs, perhaps more rooted in political survival and coalition preservation than long-view policy constructions. Even with clarity on the obligations of government to migrants and especially asylum-seekers, this reality can be skewed by the immediacy of a desire for continued existence in elected capacity. It matters less about what is right in the larger sense, where the EU is operating, and more about what is right in context, now (where member states operate).

This is both problematic and alarming. Research on the context of policy decisions in this area is lacking. As Tarik Abou-Chadi found, "government actors' preferences are directly translated into policy outputs, whereas the links between the actors and the rules structuring their behavior are ignored, or at least under-investigated" (2016, p. 2102). Government officials are aware of anti-immigrant sentiment within nations, even if overarching values suggest that free-flow of immigrants is best. Politicians might initially seek to change the system through their election and work but find that they are being changed by the system instead – made to behave and act in certain ways for the sake of survival. Change does not come to such a system because too much of a short-term nature rests on making the "big choices." Small choices, or the appearance of activity, must therefore suffice. Alignment between overarching and local considerations on immigration policy matters is likely to be affected by how great a problem migration is in that particular instance, and how much the nation is

associating itself with the EU generally and for what reasons (Guérin 2018). Where the migration concern is seen as a crisis, requiring swift and severe restrictive policy on a national level, or where nations have a more firmly established view on the topic of migration and asylum, alignment potential will be small. If nations are emulating the EU with purpose on the topic, then alignment will be greater (Guérin 2018). Explanatory factors may be gleaned beyond this, from a review of the discourse at the levels of the member-states.

I have noted in my own research (Atkinson, forthcoming) that legal adjustments in member states tend to suggest large movement, in rhetorical flourishes – in the making of citizen from migrant, for example – but this rests primarily in the realm of the administrative. The process suggests assimilation and inclusion but what is achieved is a lack of inclusiveness, at best, and at worst, the potential for marginalization, othering, and even harm to disadvantaged and at-risk groups. There is clear path-dependence and a need to address local political considerations above broader issues like societal change and the nature of citizenship. The reasons for this should be clear enough. If social and economic factors influence belief about migrants and asylum-seekers, and the result is that those beliefs, even if incorrect or indefensible, are helpful to those in power, the notion of dissuading the public from such beliefs might seem silly to those seeking to maintaining their positions. Across nations, there are games played: which nations will take the greatest burden and ruses of cooperation and shared values when particularism rules the day. This is true to the extent that many would like the supranational EU level to take priority in defining policy (Hatton 2015). This result is unlikely because it requires a reconfiguring not only of expectations between member states and the whole, but also in the population, with popularly held opinions about migrants and asylum-seekers generally, and their value to society, being challenged. The political cost might seem too great.

However, the human cost is cumulative and undeniable. The amplification of anti-migrant rhetoric leaves long-term damage, and the population is left clamoring from one crisis to the next, led to believe through unfair generalizations that migrants or asylum-seekers are the root of societal problems. Public, non-elite discourse has been reduced to sound bites and rancor, and thoughtless reciting of political rhetoric. As Adorno suggested, "life has changed into a timeless succession of shocks, interspersed with empty, paralyzed intervals. . .the mishmash of enlightened manipulation of public opinion and oblivious activity: all this is another expression for the withering of experience, the vacuum between men and their fate" (quoted in Jay 2004, p. 129). The simple answer of demonization and scapegoating does not approach the larger, more difficult questions of societal change or the hollowing out of the public sphere; it does serve elite desires for stabilization and maintenance of power, and it has resulted in a withering of public involvement. In that respect, the underlying assumptions of elite discourse – the use of language in public life and its implications for at-risk groups – deserve more critical examination.

Ford et al. (2015) highlighted shifts in immigration policy as efforts to achieve balance in an increasingly constrained policy environment; they suggest that restrictive policies are public-demand-driven, but in this knotty environment, even elites cannot engage in policy as they might wish. Elites cannot simply allow for tough policies for certain groups as a matter of course; they must recognize that the supranational organization also has desires and is an effective "interest" in its own right, as elites have been reticent to offend the supranational organization either. With increasing division within the union, it is a legitimate question whether there is an increasing shift toward the internal policy construction of individual member-states, in an environment where the pooling of sovereignty that led to the creation of the EU has shown itself to be less than fully realized. Policies across the EU are not common, and there is increasing reason to efforts in that regard will be resisted into the future; EU policy is too underdeveloped, and the countering force in the member-states is, relatively, too strong (Hampshire 2016).

## Conclusion

In approaching analyses of problem definition and program design in EU immigration policy, additional attention to the role of elite discourse is a worthwhile focus. While the EU is progressively disposed to language that is indicative of a free-flowing right of movement within the EU for citizens and families, the local, particular viewpoint often diverges from the assumptions of these higher-order goals. It is important to consider not simply the divergence itself, but the assumptions that undergird political arguments in these cases. There is a need for clarity of purpose in immigration reform, but the environment of policy imposes constraints that limit the potential for policies and programs that serve both the affected, at-risk communities and the citizens of nations themselves. The greater the divergence between citizen perspectives, migrant and asylum-seeker needs, and policy directions, the greater the potential for misunderstanding. Societal growth and change will occur regardless; this can either be led by public policy, or foolishly avoided. Elite discourse surrounding immigration policy and reform may appear as simple pursuits of power maintenance to the elite, but this is all quite consequential to the population, including to those where any supposed game could be a matter of life and death.

# Immigration: End of Schengen Agreement?

Michele L. Crumley
Department of Political Science, International Affairs, and Public Administration, Johnson City, TN, USA

## Synonyms

Europe; Immigration; Migration policy; Schengen

## Definition

Immigration is the action in which a person establishes residence in another country for at least 12 months.

## Introduction

The European Union represents the most integrated economic, political, and social regional intergovernmental organization in the world. This standard bearer of progressive regionalism evolved into a supranational union, yet in spite of policies that eroded state sovereignty, the EU never abandoned the Westphalian system. After expansion in membership and purpose, migration is challenging the basic tenets that underscore the shared norms of "solidarity in unity and diversity."

More than one million migrants or refugees poured into the EU by land or by sea in 2015 alone, and more than eight hundred thousand were predicted to arrive in 2016 (ODI 2016: 10). The flow of migrants to Europe is not unique historically; however, the number of asylum seekers as measured in first time applications is unusual. The continuing Syrian civil war and violence in Afghanistan and Iraq are the primary reasons many refugees have fled to Europe. However, poverty and human rights abuses are some of the other reasons for which people are flowing from Albania, Kosovo, Pakistan, Eritrea, Nigeria, Iran, and Ukraine further into Europe (Eurostat 2016; BBC 2016a).

Migration is the term used to define the movement of people to another state for the purpose of employment, opportunity, or fleeing to relative safety from a conflict area or one in which there is a threat of harm. "Migrant" is used broadly, and it refers to those who travel across borders by legal means and those who travel across borders without government approval (i.e., undocumented migration or irregular migration). The word "refugee" refers to a person fleeing violent conflict, persecution, or natural disasters. International law stipulates that anyone who is threatened by real persecution by physical harm if returned can ask for asylum through an application process. If granted asylum, then refugees are eligible for rights and benefits by the host state. All refugees are considered migrants, but not all migrants are refugees (Open Society Initiative for Europe 2015).

EU policy on migration reflects both Europeanization and intergovernmental approaches with states permitted to pursue their own policies. Although these approaches are not mutually exclusive, the evolution of European institutions and policies has been toward Europeanization since the late twentieth century. Recently, Europeanization has been challenged by migration to Europe. In what ways are the new challenges to Europeanization different from those in the past?

The intergovernmental agreements of EU member states allow for variation in approaches to immigration policy within the EU. Consequently, the EU policies that reflect Eurosceptic and national interests over a uniform policy for territorial boundaries, as reflected in immigration policy, undermine EU agreements intended to foster greater integration. Key intergovernmental agreements affecting territorial boundaries are discussed below, and then the shift in migration patterns are examined. Lastly, government responses to increased migration and the impact on Europeanization are analyzed.

## Forging a New Perspective on Border Control

The European Community and European Union are formed from treaties between states. In order to amend the founding treaties, reforms historically have been negotiated at an intergovernmental conference. An amending treaty must then be signed by all member states and ratified in respective member state's parliaments. In some cases, member states may present the treaty to its constituents in the form of a referendum (Cini and Perez-Solorzano Borragan 2016: 19). Hence, intergovernmentalism is deeply embedded in the process of policy making within the EU.

### Enhancing Europeanization

The 1957 Treaty of Rome first articulated the aspirational goals of removing internal borders. However, national border controls continued until member states were willing to negotiate new policies to address the increasing cross-border migration and growing anxiety over transnational crime and terrorism. Intergovernmental negotiations led to law enforcement cooperation and the establishment of the Customs Mutual Assistance Group, judicial cooperation group, and ad hoc groups on immigration and organized crime. Together, these groups facilitated a gradual Europeanization of police and judicial cooperation, immigration policy, and asylum policy (Cini and Perez-Solorano Borragan 2016: 283). The foundation for stronger external borders and the elimination of internal borders with closer cooperation between states occurred before the European Union expanded to the east and south.

The Maastricht Treaty (1992) ostensibly eroded sovereignty by identifying areas of "common interest" that extended to immigration policy and third-country nationals (TCN), asylum policy as it relates to external borders, international fraud, drug trafficking, organized crime, terrorism, and other areas. As Maastricht was negotiated, it was apparent that there were differences over whether Justice and Home Affairs' policies should become a supranational policy adopted by all members or whether an intergovernmental approach would be better suited for the organization. By having the European Communities (e.g., Commission, Council) increasingly deal with immigration and asylum, as well as civil cases related to police and judicial matters, the Amsterdam Treaty (1997) led to a supranational approach to policy in those specific areas while leaving criminal matters to be addressed using an intergovernmental approach (Cini and Perez-Solorano Borragan 2016: 284).

### The Schengen Area

The Schengen Agreement began as an agreement between a group of states within the European Community who were committed to the elimination of internal border controls. The initial agreement was signed in 1985 and proposed a gradual elimination of border checks between states in the Schengen area. The agreement was followed by the Schengen Implementation Convention in 1990 which proposed border policies that would create a territorial boundary where internal border checks would be eliminated and entrance into the area would have a standard shared visa requirement. In order to achieve these objectives, Belgium, Netherlands, Luxembourg, France, Germany, and Italy first cooperated to create a system that connected law enforcement and customs authorities, including developing a shared database of criminal records and information on asylum seekers. The Schengen system promoted efficiency and administrative cost savings by establishing that one state would be responsible for claims rather than having an applicant submit duplicate applications in several states within the European Community. Schengen also established uniform visas and a visa policy that would lead to a list of countries from which its citizens would no longer need an entry visa (European Commission 2014a).

The greatest achievement in the Schengen framework is the removal of border controls between member states, thereby creating a common entry policy for the collective area that became the European Union. By establishing an "area of freedom, security and justice" (AFSJ), the Amsterdam Treaty of 1997 incorporated

Schengen into the European Union law by giving authority to the Council to create policies that would promote the free movement of people inside the European Union. In spite of early skepticism about the removal of internal borders by Denmark, Ireland, and the UK, the Schengen Agreement and subsequent complimentary agreements became the model for closer cooperation.

## Cooperation and Enlargement of the EU

Despite efforts to promote the free movement of people, goods, and capital within the Union, not all members were willing to acquiesce to diminished sovereignty without reservations. In fact, the UK and Ireland chose not to join the Schengen system. The UK and Ireland do however cooperate in police and judicial matters with others in the AFSJ. Law enforcement and civil servants addressing asylum cases have become accustomed to cooperating across state boundaries both inside and outside the Union. At the time, only 13 of 15 countries in the EU supported Schengen, but two European states outside the EU did choose to sign the protocol attached to the Amsterdam Treaty (European Communities 1999; Cini and Perez-Solorano Borragan 2016: 286).

The EU objective of permitting the free movement of persons required a collective approach as the standards for European enlargement were negotiated in the 1990s. As part of the accession agreements with governments in Central and East Europe, the Czech Republic, Hungary, Poland, and Slovakia were required to incorporate the policies of the EU's Justice and Home Affairs and to accept Schengen. In principle, this meant that passports were needed for citizens traveling between states where there may not have been a previous requirement. The borders with non-Schengen states were to be strengthened, and the states pursuing accession were compelled to accept persons who sought asylum but first transited through those countries.

The 1990 Dublin Convention deemed that as long as a state of origin or transit was declared safe, then the state of origin inside the EU is responsible for registering an asylum seeker's application and for fingerprinting the applicant. Under the Dublin agreement, asylum seekers who move on to other Union states can be returned to the state in which they are registered with exceptions made only for family reunification. During the accession negotiations, the Schengen and Dublin agreements were conditions to achieve incorporation into the EU. Trade and aid agreements were extended to compel the Czech Republic, Hungary, Poland, and Slovakia to agree to the terms, and the EU tied some aid to strengthening the borders with non-EU states. In addition, the EU advised the prospective members on policies that were consistent with the EU (Grabbe 2006).

European enlargement into Central and East Europe occurred in two waves. In 2004, the former communist countries of Estonia, the Czech Republic, Hungary, Latvia, Lithuania, Poland, and Slovakia became full members of the EU. Malta and Cyprus also became full members at the same time. In 2007, Romania and Bulgaria were given full membership, and in 2013 Croatia became a member of the EU. Of the 28 states in the EU, 22 are part of the Schengen area. Bulgaria, Croatia, and Romania are not in the Schengen area yet, although it is expected that they will eventually become a part. The UK, Ireland, and Cyprus opted out of the Schengen system. By contrast, there are no opt-out options with the Dublin agreement. Although amended several times and often referred to as Dublin III, principles of the Dublin convention are now considered a regulation that applies to all members of the EU (Lyons 2015: A12).

The "area of freedom, security, and justice" articulated in Schengen and strengthened in the Amsterdam Treaty appealed to nonmember states who shared borders or interests with the EU. Iceland, Liechtenstein, Norway, and Switzerland are part of the Schengen area, and they agreed to apply the Dublin regulation in their territories (Cini and Perez-Solorano Borragan 2016: 286). The increasing intergovernmental cooperation is indicative of a growing Europeanization throughout the continent, but it also signified shared norms and values which promoted liberal policies facilitating the free movement of people across state boundaries. These shared norms respected individual human rights and freedoms in traveling, working, studying, and retiring within the Schengen area.

### From Intergovernmental Agreements to Increased Europeanization

Intergovernmental cooperation gained momentum after the Amsterdam Treaty, and key developments on migration policy making occurred after the European Council met in Tampere in 1999. By this time, the European Council had agreed to common rules for education, employment, extradition of third-country nationals (TCNs), readmission agreements for TCNs, a standard visa policy, and even a fingerprinting system for asylum seekers and those needing temporary protection status. In addition, Europol was created to provide a regional police office designed to promote cooperation and further enhance capabilities in combatting drug trafficking, human trafficking, and terrorism (Tampere European Council 1999).

The Tampere Agreement in 1999 promoted a comprehensive approach to immigration and asylum. First, negotiations were aimed at eradicating poverty and other political and economic conditions that lead individuals to flee their homes. Second, the negotiations in Tampere resulted in EU states establishing a Common European Asylum System which set standards for asylum claims and for the care of asylum applicants. The European Commission was designated with the task of formulating policies, and the Commission became entrepreneurial in introducing numerous proposals (Menz 2013). Commission proposals addressed issues such as conditions of reception areas for refugees and family reunification policy for refugees. The Commission also approved setting up the European Refugee Fund which has become more important with the large influx of refugees fleeing Syria, Afghanistan, Iraq, and other states experiencing violence, war, and human rights abuses (Tampere European Council 1999; Menz 2013). The European Refugee Fund provides aid to EU states receiving refugees.

## Migration Patterns in Europe

Beginning in the 1950s large migratory movements reflected labor needs. Post-colonial migrants searched for employment and opportunities in Europe, while people from southern Europe moved to the more industrialized states found in northwestern Europe. The high demand for labor in the immediate postwar years, especially for low-skilled labor, served as an impetus for migration. Belgium, Germany, and the Netherlands introduced guest worker programs to recruit unskilled laborers from southern Europe and the Mediterranean. There were also movements from Finland to Sweden and Ireland to the UK. Then, guest worker programs ended during the oil crisis in the 1970s, and migration flows slowed. During the next decade, migration continued from the Mediterranean (e.g., notably from Turkey and Morocco) primarily in the form of family reunification. By the late twentieth century, migration to Europe increased in the form of persons seeking asylum from a variety of regions of the world (Castro-Martin and Cortina 2015: 111; Hansen 2003; Van Mol 2015).

### Intra-European Migration

Migration between European states increased slightly in the 1990s; however, intra-European migration rose significantly after the EU enlargements into Central and East Europe in 2004 and 2007 (Favell 2008). From 2003 to 2007, the largest intra-European flow of migrants came from Poland to Germany and from Romania to Spain and Italy in search for higher labor wages and opportunities. The financial crisis of 2008 led to shrinking labor demand, and the migration flow from east to west declined considerably through 2012. Nonetheless, migration increased between 2008 and 2012 from Spain to the UK and since 2012 intra-European migration from east to west has again rose (European Commission 2014b).

In a 2013 Eurobarometer survey, one in four respondents indicated that they would consider working in an EU country that was not their home country within the next decade, yet only 9% of respondents reported ever having lived or worked in a different EU state than their home country (European Commission 2013). Most Europeans do not change their citizenship from their place of birth, and only about 11% reportedly changed their EU citizenship from that of their home country (Eurostat Statistics Database 2014).

Half of all intra-EU migrants are from states that joined the Union after 2004 in spite of the fact

that the population of these countries only accounts for 21% of the entire EU population. Moreover, some countries became the destination for large numbers of intra-EU migrants from the same country of origin. For example, 68% of Poles living in another EU state are in Germany or the UK, and 75% of Romanian citizens in another EU country have gone to Spain or Italy (Castro-Martin and Cortina 2015: 115). Residential segregation occurs as immigrants concentrate housing into areas of similar nationality, and this impedes social integration into the host country. Hence, intra-EU immigrants often face similar obstacles as non-EU migrants, such as insufficient language skill level in the host country, difficulties in obtaining access to housing and social benefits, and disproportionate numbers living in disadvantaged neighborhoods (Kennedy 2008; Collett 2013a, b; Castro-Martin and Corina 2015: 120). Although EU immigrants have the right to free movement inside the Union and they legally enjoy the same rights as natives, the heterogeneity of intra-EU migration and the related behaviors are perhaps less studied but as important in influencing perceptions of migrants in host countries.

## The New Wave of Migrants and Asylum Seekers

Before freedom of movement within the Schengen area influenced intra-EU migration flows, the European Council stated that "a better management of Union's external borders will help in the fight against terrorism, illegal immigration networks, and the traffic in human beings" (Hobbing 2006: 168). External border controls were enhanced with the establishment of six ad hoc national centers under the authority of the External Border Practitioners Common Unit. Subsequently, the Hague Programme established the European Agency for the Management of Operational Cooperation at the External Borders of the Member States of the European Union (Frontex) to intensify cooperative efforts for border control of Schengen members. Frontex sought to address immigration issues from third countries, thereby threats were perceived to come into the EU from the outside. Although each member state is still in charge of its own borders, Frontex has carried out operations in nonmember states in order to stop migrant boats from arriving on EU shores. It also has immigrant liaison officers in third countries and other authoritative mechanisms to support border controls such as EU visa requirements and carrier sanctions (Cierco and da Silva 2016: 9–10).

Reaching consensus over how to address external border controls addresses only part of the overall EU concern about asylum seekers and migrants. In 2006, the European Commission established minimum standards for qualifications for subsidiary protection; that is, non-EU citizens or stateless persons who did not meet the standard of refugee status were entitled to a minimum of rights and benefits. In essence, the Commission's deliberations (2004/83/EC) created a regulation of asylum for persons who had the potential to be persecuted by a non-state actor or those who could potentially be persecuted on gender-specific grounds if returned to their home country (Menz 2013: 93).

In contrast to asylum regulations, labor migration regulation proposed by the Commission has faced greater opposition by member states who objected to quotas and specific guidelines, but the Union recognizes demographic changes and labor market shortages (Menz 2013: 97). The International Labour Organization reported that Europe will lose a projected 22 million persons from the labor force in the next two decades due to an aging population. A declining population affects productivity levels and competitiveness. In a 2014 study, the ILO also identified 25–45% of workers do not have the appropriate skill level needed in their job. Unmatched skills to a job often lead to turnover and low productivity. Perhaps paradoxically, businesses report labor shortages even at times of high unemployment, and unemployment levels are much higher in some countries than in others. For example, in the third quarter of 2014, unemployment rates had reached 25% in Greece and 23% in Spain, two states that have been entry points for the irregular migrants. Greece and Spain had unemployment rates around 8% only 3 years earlier (ILO 2015).

The arrival of a record number of migrants and refugees in Europe since 2012 is largely a result of

relative economic prosperity and political stability in Europe and conditions in the migrant's home country. Geographic proximity and domestic laws regarding asylum and migration are also variables in the decision of migrants and refugees choice of destination. The approval of an asylum application depends from which country the applicant originates and in which country they apply. Throughout Europe, Syrian applications for asylum were successful 98% of the time. There is wide variation of acceptance levels for applicants of asylum from Afghanistan, Libya, Somalia, and other states experiencing violence or instability. This is also a variation of asylum application acceptance not only by country of origin but also by destination. For example, applications for asylum were accepted 100% of the time in Slovenia but only 50% of the time in Portugal. In addition, there is variation in reported procedural costs in destination countries (ODI Report 2016: 12).

More than a million migrants and refugees arrived in Europe in 2015, and more than 80% originated from Syria, Iraq, and Afghanistan. Smugglers facilitated the flow of migrants fleeing conflicts to Europe through Turkey, Russia, and northern Africa. Human trafficking and irregular migration included persons from Eritrea, Morocco, Pakistan, and Somalia who fled from human rights abuses, poverty, and increasing instability. Many asylum seekers attempted to cross into Europe with destinations of Germany and Sweden in mind. However, the free movement of persons in the Schengen area does not extend to third-country migrants and refugees. The Dublin regulation requires asylum claims to be registered at the first state where the refugees arrive, yet EU member states of Greece, Italy, and Croatia have allowed migrants to pass through to states further north. And in violation of the Dublin agreement, some states fail to send migrants back to the first country they entered in accordance with the law. In Italy and Greece, many migrants have refused to be fingerprinted or refused registration in order to avoid the prospect of being returned later as required by the Dublin regulation. Without full compliance with Dublin, hundreds of thousands of migrants and refugees spread along corridors through Hungary, Serbia, Austria, and Croatia as they proceed north while upwards of 5000 persons gather in Calais with the hope of being able to enter the UK via the Chunnel (Park 2015: 4; BBC 2016b; Cierco and da Silva 2016: 11).

## Responses to Immigrants and Refugees

Immigration to the EU increased as the Arab Spring spread in 2011. The European Commission increased funding for Frontex, and it called for solidarity and burden sharing. Additional financial assistance was extended to member states receiving the largest number of migrants. Nevertheless, differences of opinion became evident. Those with external borders and vulnerable to an influx of irregular immigration advocated for a redistribution of immigrants, while states without external borders often blamed others for weakened external border controls. As a result, the Council and European Parliament agreed to reform Schengen. The Council agreed on provisions that allowed for "the temporary reintroduction of border controls at internal borders in exceptional circumstances," which is in cases of "serious threats to public policy or internal security," and when "another Schengen member neglects its [border] control obligations" (Council of the European Union 2013: 1, 4; Cierco and da Silva 2016: 10).

The flow of migrants and refugees from Turkey to Greece began over land, but when Greece closed the border and erected a 6.5 mile fence, migrants began entering Greece by being trafficked through the Aegean Sea. Bulgaria tightened its border with Turkey by building a 21-mile and 10′ barbed wire fence. Similarly, the UK improved fencing around the English Channel Tunnel, spending approximately $10 million to deflect migrants (Cierco and da Silva 2016: 12–13).

Hungary also built a 109-mile barbed wire fence along the border with Serbia, a non-EU state, to stem the tide of migrants from the southeast. More than 60,000 irregular migrants from Syria, Afghanistan, Iraq, Kosovo, and Somalia entered Hungary in the first 6 months of 2015

(Cierco and da Silva 2016: 12; Kern 2015). The Hungarian government appealed to nationalist ideas of "defending Hungary" and "defending the Hungarian people from the immigration pressure." A public opinion poll conducted in 2015 showed the 46% of respondents believed "no asylum seeker should be allowed to enter Hungary" (Park 2015: 4).

With Greece, Italy, and Croatia ignoring Dublin regulation obligations, Austria ceased processing asylum applications in June 2016, and Denmark announced that it would cut benefits for asylum applicants in order to make the country less attractive to refugees. Internal border controls have been strengthened by Germany along the borders with Austria and the Netherlands. Germany also unilaterally suspended the Dublin regulation, thereby ending deportations of Syrians to their country of entry into the EU (Cierco and da Silva 2016: 11).

The erosion of Schengen and the Dublin regulations contributed to an EU decision in September 2015 to relocate 160,000 people from Greece and Italy to other states within the EU based on a quota system over the course of 2 years. The Relocation Mechanism is a humanitarian attempt to promote an egalitarian approach to the migration crisis. After months of negotiations, the Council agreed to binding quotas for states who received few migrants, taking into account "population (40%), GDP (40%), number of previous application and resettlements (10%), and the domestic unemployment rate of that specific country (10%)" (Kallai and Maniu 2016: 23). However, the Czech Republic, Slovakia, Romania, and Hungary voted against the Relocation Mechanism's quota system in the Council, revealing a division between newer and older members of the EU (Park 2015: 7). The controversial plan led to Slovakia and Hungary filing a challenge to the relocation quotas in the European Court of Justice (Council of the European Union 2016). The Hungarian government also held a national referendum to reject mandatory migrant quotas (BBC 2016c).

The EU-Turkey deal in March 2016 attempts to deter migrants coming by boat through the Aegean to Greece by forcing those asylum seekers deemed "inadmissible" to return to Turkey. In exchange, another Syrian refugee who has not attempted to enter illegally will be allowed to resettle in the EU. This creates a deterrent for illegal entry and an incentive for Turkish cooperation. Turkey will receive three billion Euros in aid for migrants and refugees inside Turkey, and Turkish citizens can access the Schengen area without a visa. The EU also agreed to revisit possible Turkish membership in the EU (ODI 2016: 25). Despite new policies and reestablishing internal border controls, the flow of migrants continues, moving from overt patterns of migration to covert that make it difficult for governments to monitor and address.

## Conclusion

With over a million undocumented migrants arriving in Europe in 1 year, and hundreds of thousands of migrants and refugees arriving since the Syrian civil war began in 2011, the social services of entry and destination countries are strained. However, an attempt to share the burden within the EU has met opposition. With new internal border controls emerging in the EU and the refusal of some states to receive the Relocation Mechanism's quota of migrants, a return to the free movement of persons inside the EU is challenged. Nonetheless, it is likely that the intergovernmental approach to immigration policy will prevail in the short term as governments react to Eurosceptic and nationalist concerns in domestic politics. The long-term prospect for a return to open internal borders as articulated in Schengen is strong as the Union has developed close cooperation with Europeanization since Maastricht and the benefits of the free movement are known.

## Synonyms

COVID-19; Fiji; Health crisis; International tourism; Samoa; Solomon Islands

## Definition

**COVID-19** is an illness caused by the novel Coronavirus. Initially, the outbreak of this virus occurred in Wuhan City, Hubei Province, in China.

**Global Health Crisis** is a complex health crisis comprised of viruses and a chain of outbreaks that affects everyone globally.

## Introduction

The Coronavirus Disease (COVID-19) pandemic has evolved from a health crisis to a global economic crisis that has impacted countries worldwide. Each country has been affected differently by the spread of the COVID-19 (see United Nations Development Programme (UNDP) 2020). Restrictions on the movement of people, which includes curfews, and national lockdowns, has adversely affected countries that rely on tourism for their livelihoods. The extent of the COVID-19 crisis that each economy faces is influenced by health infrastructure, financial resources, economic structure, and fiscal space available for government's expansionary policy and socioeconomic resilience and capabilities (UNDP 2020). Governments need fiscal space to intervene in the economy proactively to address issues faced by businesses, workers, and farmers. Special policies are also needed to support the financial institutions to continue operating and, in return, provide support to the businesses.

In the COVID-19 crisis, the government intervention included additional expenditures to fund the measures taken to address the pandemic. Governments also needed resources to assess the impact of the COVID-19 crisis on vulnerable groups, economic agents, and society to develop policies tailored to meet the specific needs of different economic and social agents. Despite low incidents of COVID-19 among Pacific Island Countries (PICs), the economic downturn has been significant (see Table 1). The International Monetary Fund (IMF) and the respective central banks have predicted deep contraction for all the Pacific Island economies (IMF 2020a). On average, it is projected that the PICs will face a contraction of more than 5% in 2020 (IMF 2020a, b; Asian Development Bank 2020a, b). The major contraction in the Pacific Island economies is flowing from the evaporation of tourism, lower commodity demands and prices. Significant decline is also expected in international trade and remittance inflows.

The tourism sector is one of the biggest sectors for Fiji as it contributed 38.9% to the Gross Domestic Product (GDP) in the year 2018 and was expected to grow further post-2018. Similarly, the tourism sectors contributed 30.4% and 12.5% to the GDP of Samoa and the Solomon Islands in the year 2018 (Research Association of New Zealand 2020). As expected, the governments of the PICs intervened with the fiscal stimulus package to revive their contracting economies. In addition, the development partners and multilateral finance agencies such as ADB, World Bank and IMF worked with the governments of Fiji, Solomon Islands, and Samoa to deliver a sustainable package to help economic survival (Research Association of New Zealand 2020). However, these countries have taken

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 1** Growth rates – pre- and post-Covid-19

| Year | 2018 | 2019 | 2020 | 2021 | Average up to 2025 |
|---|---|---|---|---|---|
| Fiji | 3.5 | −1.3 | −21.0 | 11.5 | 2.2 |
| Solomon Islands | 3.9 | 1.2 | −5.0 | 4.5 | 3.0 |
| Samoa | −2.2 | 3.5 | −5.0 | −1.5 | 2.2 |

broadly different measures to address their economic problems. These economies, however, are projected to grow only marginally in the following years.

Against this backdrop, this entry aims to examine the impact of the COVID-19 on the tourism industry of Fiji, Solomon Islands, and Samoa. This entry is divided into eight sections. Section "Background of COVID-19 in the Pacific Island Countries (PICs)" provides the background of COVID-19 in the PICs. Sections "COVID-19 Economic Trends in Fiji, Samoa, and the Solomon Islands" and "Status of COVID-19 Cases in Fiji, Samoa, and Solomon Islands" provide the overview of the COVID-19 economic trends for these countries and their current status. Section "Impact of COVID-19 on the Tourism Sectors of Fiji, Samoa, and the Solomon Islands" provides the analyses of the pandemic on the tourism sectors of these economies. Section "National Governments Fiscal Stimulus Package to Revitalize the Contracting Economy" discusses the national government stimulus packages to revive the tourism industry. Section "Tourism-Related Recovery Policies" proposes some options and alternatives for a better recovery process during such a crisis and contributes to the resilience of these PICs. The last section provides some concluding remarks and policy options.

## Background of COVID-19 in the Pacific Island Countries (PICs)

The ongoing global COVID-19 pandemic has been disastrous for tourism, international trade, remittances, and commodity prices. The small Pacific Island developing economies that are heavily reliant on the tourism sector for employment, contribution to GDP, and economic growth have been significantly affected (IMF 2020a, b). Tourism inflows in the first quarter of 2020 had significantly declined, imposing negative repercussions on employment and economic growth. Supply chain disruptions, coupled with the expected decline in remittances and falling demand, took a toll on the fiscal revenue of the PICs. Soon after the COVID-19 pandemic was declared, all countries worldwide took immediate measures to protect their citizens from infection leading to lockdowns that eventuated into negative shocks (IMF 2020a, b). As of early October 2020 (many months into the pandemic), there were no confirmed cases of infection in Kiribati, Marshall Islands, Micronesia, Nauru, Palau, Samoa, Solomon Islands, Tonga, Tuvalu, and Vanuatu. However, all these PICs had acted promptly in March 2020 to close down their borders as soon as the COVID-19 epidemic reached Fiji and Australia, and New Zealand imposed international travel restrictions (IMF 2020a, b). Specifically, the PICs implemented containment measures and increased the spending on the health infrastructure and preparedness to fight against the spread of the COVID-19 pandemic (IMF 2020a, b).

Although the PICs managed to diligently deal with the COVID-19 pandemic, the deeper economic recession triggered by this health disaster transformed into an economic crisis and posed a huge welfare and livelihood problem for the people of PICs (IMF 2020a, b). According to IMF (2020a, b) and (ADB 2020a), it is projected that the PICs will record an average of −5% growth for the year 2020, with the largest drop in the economic growth experienced by Samoa, Solomon Islands, and Fiji in the last 10 years. However, with the availability of vaccines, international trade will pick up in the first quarter

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Fig. 1** Real GDP actual and latest projects. (Source: (IMF 2020a, b))

of 2021, but the setback in tourism activity may continue for a while and not resume until the second half of 2021 (IMF 2020a, b). The sharp decline in the global demand triggered by COVID-19 may also have adverse implications on the recovery of the commodity prices across the region, impacting the logging industry for the Solomon Islands and similarly for Fiji and Samoa. Figure 1 shows that the average Real GDP of the PICs is expected to fall significantly from positive growth of 2.2% in 2019 to −5.5% in 2020. IMF (2020a, b) predicts that the average real GDP for PICs will record an upswing to 1.4% in the year 2021. Fiji is predicted to grow at 11.5% in 2021, while the Solomon Islands and Samoa are predicted to grow at 4.5% and −1.5%, respectively.

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 2** Actual and projections of real GDP

| Pacific Island countries (PICs) | 2019 | 2020 | 2021 |
|---|---|---|---|
| Fiji | −1.3 | −21 | 11.5 |
| Palau | −1.8 | −11.4 | −7.4 |
| Vanuatu | 3.3 | −8.3 | 4.3 |
| Samoa | 3.5 | −5 | −1.5 |
| Solomon Islands | 1.2 | −5 | 4.5 |
| Marshall Islands | 5.3 | −4.5 | −0.9 |

## COVID-19 Economic Trends in Fiji, Samoa, and the Solomon Islands

These three Pacific Island countries have suffered prolonged closures of economic activity within the region. Virtually all international travel has been curtailed. While Fiji suffered a huge economic decline of more than 21% due to the complete closure of tourism, Samoa and Solomon Islands that relied less on tourism have suffered much less contraction of around 5%. Table 2 provides details of real GDP decline for these respective periods. In further comparison, Vanuatu and Palau also experience greater economic contraction due to the COVID-19 crisis. These two economies are predicted to decline by 8.3% and 11.4%, respectively. The real GDP projections for the year 2021 indicates that Fiji and Solomon Islands will experience a positive Real GDP growth rate of 11.5% and 4.5%, while Samoa is expected to further contract by 1.5% in 2021.

As far as the current account is concerned, it is expected to deteriorate to substantial margins for Fiji, Samoa, and Solomon Islands. Table 3 shows that the current account balance of Fiji is expected to record a deficit of 15.3% of GDP while it is likely to slightly recover in the year 2021 (IMF 2020a, b). Similarly, Samoa and the Solomon Islands record current account deficits of 7.1% and 11.3%, respectively. Lower import demand is likely to partially offset losses from the international trade of goods and services from Fiji, Samoa, and Solomon Islands (IMF 2020a, b).

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 3** Current account balance (% of GDP)

| Pacific Island countries (PICs) | Year | | |
|---|---|---|---|
| | 2019 | 2020 | 2021 |
| Fiji | −12.9 | −15.3 | −12.1 |
| Samoa | 2.3 | −7.1 | −7.0 |

| Fiji | −5.1 | −19.2 | −9.0 |
| Samoa | 2.7 | −7.3 | −9.8 |
| Solomon Islands | −1.7 | −5.6 | −4.9 |

Source: IMF (2020a, b)

Evidently, the fiscal position of Fiji, Samoa, and the Solomon Islands are likely to weaken due to the decrease in economic activity, rising government expenditure, and increase in government health spending (IMF 2020a, b). Lack of financing options and fiscal space is a challenge to Fiji, Samoa, and Solomon Islands. Importantly, there has been an increase in financial support from multilateral and bilateral sources. However, this financing support is subject to tradeoffs with a high level of public debt (IMF 2020a, b). Table 4 shows that the fiscal account balance of Fiji, Samoa, and the Solomon Islands significantly deteriorated from 2019 to 2021. According to IMF (2020a, b), the fiscal account balance of Fiji will deteriorate from an already bad state of −5.1% in 2019 to greater than −9% in 2021. Similarly, the fiscal account balance of Samoa is expected to worsen from +2.7% in 2019 to −9.8% in 2021. Solomon Islands will also experience a significant deterioration of its fiscal position from −1.7% in 2019 to −4.9% in 2021 (IMF 2020a, b).

## Status of COVID-19 Cases in Fiji, Samoa, and Solomon Islands

Fiji confirmed its first COVID-19 case on 19 March 2020, and as of the end of November 2020, there were 35 known cases with a total of 2 deaths. Fiji remained free of Covid-19 transmission for many months from its peak months until the end of 2020 (United National Office for the Coordination of Humanitarian Affairs 2020). Samoa announced its first COVID-19 case on 30 November 2020, involving two travelers from Europe via New Zealand (RNZ 2020). Samoa remained Covid-19-free for more than 11 months by its strict monitoring and quarantine processes. Samoa's recent experience in battling against measles outbreak may have been useful in keeping Coronavirus away from its shores. Since the announcement of its first COVID-19 case, the country has experienced panic behavior among its citizens (Aljazeera 2020). In his address to the nation, the prime minister asked the people to calm down and promised to maintain health as a top priority to keep Samoa safe from Covid-19 as many other countries in the region lost their COVID-19-free status. So far, however, some countries among PICs such as Tuvalu, Tonga, Kiribati, Micronesia, and Palau have remained free from the virus (Aljazeera 2020). Unlike the case of Fiji, the Solomon Islands had recorded its first COVID-19 case on 3 October 2020, a student returning from the Philippines (WION 2020). However, the government of Solomon Islands remains confident that it will be able to manage and respond to the COVID-19 situation effectively (WION 2020). Table 5 shows that as of 24 November 2020, 35 confirmed COVID-19 cases in Fiji, 1 in Samoa, and 17 in the Solomon Islands. The total proportion of fatal cases in Fiji stands at 5.88%, while it is 0% for Samoa and Solomon Islands.

Furthermore, the World Health Organization (WHO) has played a critical role in supporting the governments of Fiji, Solomon Islands, and Samoa in responding to their COVID-19 situations. WHO's support has been mainly in the form of surgical supplies, N95 masks, face shields, protective goggles, isolation gowns, and GeneXpert testing cartridges. The WHO is conducting online training programs for scientists in the Northern Pacific on the GeneXpert monitoring system, which has been quite effective (WHO 2020). Table 6 shows that WHO has

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 6** Distribution of GeneXpert cartridges

| Country | Batch 1–19 | Batch 1–19 ongoing | Batch 1–19% complete | # cartridges allocated total | % completed |
|---|---|---|---|---|---|
| Fiji | 8250 | 440 | 95 | 26,750 | 31 |
| Samoa | 1420 | 60 | 96 | 6000 | 24 |
| Solomon Islands | 5320 | 540 | 91 | 18,000 | 30 |

Source: WHO (2020)

completed 31%, 24%, and 30% distribution of the GeneXpert Cartridges in Fiji, Samoa, and the Solomon Islands, respectively.

Table 7 shows that the COVID-19 mobility trends in Fiji have increased for retail and recreation by 5%, supermarket and pharmacy by 14%, and places for residential by 6%. However, a decline in mobility trends has been noticed for parks by 8%, public transport by 30%, and workplaces by 24%.

The PICs, particularly Fiji, Solomon Islands, and Samoa, have adopted a cautious approach to managing the COVID-19 crisis. It is very well known that the Pacific islands have poor health infrastructure that is struggling to deal with the high obesity rates, diabetes, heart attacks, and high blood pressure (Aljazeera 2020). The small island economies are not ready to deal with the crisis if it gets out of control.

## Impact of COVID-19 on the Tourism Sectors of Fiji, Samoa, and the Solomon Islands

Tourism and remittances are considered a very important source of income for the Pacific Island economies, particularly Fiji and other Polynesian countries such as Samoa and Tonga. The data on remittances shows that while the global economy has contracted significantly, remittance flows to PICs have continued to increase. The tourism sectors for Fiji and Samoa are proportionally large, but that of the Solomon Islands is small yet significant for the sustenance of employment. Tourism provides the highest number of jobs to women who are economically and socially disadvantaged as compared to men in these countries. Tourism also provides a huge opportunity for micro, small, and medium enterprises. It also facilitates access to the markets for locally made

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 7** COVID-19 mobility trends in Fiji

| Areas of mobility changes | Fiji (%) |
|---|---|
| Retail and recreation | +5 |
| Supermarket and pharmacy | +14 |
| Parks | −8 |
| Public transport | −30 |
| Workplaces | −24 |
| Residential | +6 |

products (Research Association of New Zealand 2020). The tourism sector contributes to sustainable economic growth by providing market access for locally manufactured tourist products. Economic statistics provides a clear indication of the impact of the tourism sector on exports, GDP growth, and employment in these countries (Research Association of New Zealand 2020). Figure 2 shows that in 2017, the tourism sector of Samoa contributed 60.1% to the exports, followed by 48.5% for Fiji, and 13.0% for the Solomon Islands. This indicates that the tourism sector contributes hugely to these island economies.

Figure 3 shows that in 2018, the tourism sector of Fiji, Samoa, and the Solomon Islands contributed 38.9%, 30.4%, and 12.5% to GDP, respectively. This indicates the importance of the tourism sector to these small PICs.

Table 8 shows that the percent contribution to total employment by the tourism sector is significantly higher for Fiji than Samoa and the Solomon Islands. Similarly, visitor arrivals and visitor spending are much higher for Fiji than Samoa and the Solomon Islands.

In comparison to Samoa and the Solomon Islands, Fiji recorded the COVID-19 case first. However, the lockdown took effect in these three countries at about the same time since the reaction in the region was mutual and simultaneous. In late March 2020, Fiji Hotels and Tourism Association announced that 93% of its members had closed their operations due to a sharp decline in tourist arrivals. As shown in Table 8, Australia and New Zealand are the two most important sources of tourism markets for all three countries. The Australian tourism minister stated in June 2020

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa,**

that Australians would not be able to travel to PICs until 2021; thus, PICs must focus on local tourism activities. This had the most damaging impact on Fiji, Samoa, and Solomon Islands (UN Pacific 2020). The Asian Development Bank's Pacific Monitor Report clearly states that Fiji's tourism and related industries are projected to negatively impact the GDP to the extent of 16% of GDP in 2020 (ADB 2020a). According to ADB specialists, Fiji's tourism industry will return to the pre-COVID levels only after 2023 on conditions that vaccines are developed by this year-end (ADB 2020a, b). The unemployment rate in Fiji has increased significantly, and much of this unemployment is located in the tourism sector. It is projected by the (ADB 2020a, b) that unemployment will continue to increase shortly unless alternative industries are generated. The IFC survey in July 2020 concluded that 50% of tourism businesses are hibernating or are fully closed, while 35% of them are operating under reduced working hours (ADB 2020a, b). According to the ADB predictions, if Fiji's situation does not improve soon, 29% of tourism businesses involved in the tourism industry and 11% of non-tourism businesses will completely close their operations (ADB 2020a, b). Table 9 shows that the visitor arrivals to Fiji are predicted to decline from −0.4% in Q4 2019 to −98.8% in September 2020 (based on a 12-month percentage change).

Similarly, the Solomon Islands tourism industry started experiencing the full effect of COVID-19 in early February of 2020. As a proactive measure, the national government of the Solomon Islands restricted passenger entry to Solomon Islands from COVID-19 infected countries (ADB 2020a, b). On 25 March 2020, all international passenger flights to the Solomon Islands were suspended, and strict quarantine measures

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 9** Visitor arrivals for countries (based on 12-month Δ%)

| Country | Q4 2019 | Q1 2020 | Q2 2020 | Q3 2020 | Sept 2020 |
|---|---|---|---|---|---|
| Fiji | -0.4 | -18.7 | -99.2 | -99.0 | -98.8 |
| Solomon Islands | 13.8 | -36.3 | -100 | -100 | -100 |
| Samoa | -10.7 | -36.2 | -100 | -100 | -100 |
| Micronesia | -0.6 | -24.3 | -100 | -100 | -100 |

| Kiribati | 16.9 | -35.3 | -100 | -100 | -100 |

Source: IMF (2020a, b)

were imposed on incoming cargo ships (ADB 2020a, b). These measures harmed the tourism industry. Virtually all tour operators in the Solomon Islands are hibernating now with no business at all. For a 3-month period from January to March 2020, the tourism industry in the Solomon Islands had recorded a decline of 50% on average per month in revenues (Lilomo 2020). It is forecasted that the decline will be much severe if visitor arrivals and hotel occupancy rates did not improve. The four major hotels in the Solomon Islands have experienced low occupancy rates of 18% and 10% in March and April, respectively (Lilomo 2020). These low occupancy rates of hotels are expected to continue until mid-2021. The largest hotel in the Solomon Islands, Heritage Park Hotel, located in Honiara, has been recording no bookings since late March. The management was forced to scale down the hotel's operations to virtual nil (Lilomo 2020). Table 9 shows that the visitor arrivals to the Solomon Islands have declined from 13.8% in Q4 2019 to −100% by the third quarter of 2020.

Tourism in Samoa is experiencing a similar fate where tourist numbers are nearly zero. This has been the direct result of the closure of international borders and slowdown of merchandise shipping (Fruean 2020). The Visitor Earnings and remittances reported for this period by the Samoa Bureau of Statistics and Central Bank of Samoa for March 2020 shows a decline of 62.7% compared to March 2019 (Fruean 2020). The report clearly states that the main factors that led to the significant decline in tourist numbers were the lockdown of international borders, the 14-day quarantine period and travel restrictions abroad (Fruean 2020). Table 9 shows that the visitor arrivals to Samoa have declined from −10.7% in Q4 2019 to 100% in Sept 2020.

According to the United Nations SDG (2020), 66.67% of the households in Samoa have experienced a decline in their income, and around 50% of the households are experiencing one job loss due to the same reasons. Figure 4 shows that the pre-COVID-19 employment rates in Samoa were critically low, with twice as the number of men employed compared to women in employment. Figure 4 shows the percentage of men and women employed in Samoa before the COVID-19 period. The regional and global value chain of businesses has dwindled significantly. This has contributed to increasing joblessness and income insecurity (United Nations SDG 2020).

## National Governments Fiscal Stimulus Package to Revitalize the Contracting Economy

The national governments of the PICs, including Fiji, Samoa, and the Solomon Islands, have mobilized fiscal tools to revitalize the contracting

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Fig. 4** Gender distribution of employment in Samoa pre-COVID-19 period. (Source: United Nations SDG (2020))

sectors of the economy. On 27 March 2020, the government of Fiji announced that they would increase the fiscal expenditure to counter the unemployment from the diminishing tourism sector. A number of development partners, such as the World Bank, Asian Development Bank (ADB), Australia, New Zealand, and other governments, have provided special funding to the Fijian government to fight against the COVID-19 pandemic (United Nations Pacific 2020). The government also implemented policies to disburse funds from the Fiji National Provident Fund. The national provident fund is a retirement fund set up by the government of Fiji, which is funded both by the employer and the employee. The government of Fiji plays a critical role in the national provident fund, and they determine the rules regarding withdrawals. In order to help the COVID-19 affected individuals, the government decided to set the funds aside for making withdrawals. These provisions by the FNPF and the new funding package were announced in the National Budget in July 2020 (The Fijian Government 2020). The announced stimulus package provided an additional FJ$1 billion, which were partially funded by the ADB loan funding of FJ$100 million and the World Bank that provided a facility of FJ$5.5 million (United Nations Pacific 2020). Australia and New Zealand also played an important role as development partners. Initially, the Australian and New Zealand governments had provided FJ$1.5million and FJ$4.47million for the COVID-19 funding. This initial funding by the Australian and New Zealand governments was later increased by FJ$15.4million and FJ$7.72 million, respectively (UN Pacific 2020). The mandatory FNPF employer and employee contributions were reduced to 5% for the period starting from April to December 2020. The workers who lost their jobs since early February 2020 or were working with reduced hours were granted eligibility to withdraw FJ$1000 from their FNPF accounts on a periodic basis (UN Pacific 2020). Businesses that were struggling through the COVID-19 crisis were able to access grants and loans on concessional terms of 5% (UN Pacific 2020).

Similarly, Samoa provided a stimulus package of T66.3 million to support the fast contracting Samoan economy. The national stimulus package was mainly aligned toward enhancing the resilience of the health sector, supporting the livelihood of Samoans and strengthening alternative industries that would at least temporarily replace the tourism sector and help the workers to survive through the hard times (Government of Samoa 2020). Table 10 provides specific details of the funds allocated for the different areas of the Samoan economy.

The Solomon Islands government also provided a fiscal stimulus package of SBD309 million to boost domestic demand and help struggling businesses survive. Special funding was allocated to reduce the utility costs to the households, reduce borrowing costs, ease the tax

**Impact of COVID-19 on the Tourism Industry of Fiji, Solomon Islands, and Samoa, Table 10** Samoan stimulus package to mitigate COVID-19

| Funds | Areas |
|---|---|
| $20.3million | Health sector response |
| $12.5million | Private sector enhancement |
| $2.5million | Coronavirus initiative |
| $27.5million | Increasing the purchasing power of Samoans |
| $3.5million | Ministry of Agriculture and Fisheries |

burden, provide financial relief, provide grants to struggling businesses, and provide alternative employments to Solomon Islanders who lost their jobs (SIG 2020). Table 11 provides some details of the government fiscal package to improve the domestic aggregate demand.

## Tourism-Related Recovery Policies

Individual PICs are not capable of dealing with the COVID-19 pandemic individually. It is understood that there are two-time tracks to this recovery. First, the PICs need to respond to the current situation where many people have lost their jobs. Secondly, these small island countries need to change their development paths to prepare for the future, where the effects of such a crisis can be handled better. The issue is that post-Covid-19, the development path of these small PICs cannot remain the same as in the past – long-term adjustments are needed to prepare these countries to handle such crisis in a far better and sustainable manner.

Regional synergies are needed to revive the tourism industry of the small and structurally vulnerable economies. Importantly, Fiji, Solomon Islands, and Samoa need to work with other small island economies in the Pacific region to develop a Pacific-centric model. This model shall be structurally more resilient and inclusive of tourism and diverse (Research Association of New Zealand 2020). Strong leadership, coupled with enhanced workforce capabilities, is needed in the tourism sector to develop focused and differentiated tourism products for the Pacific. Regional leadership is needed to develop policies for the Pacific bubble to ensure that our borders open much earlier. Capabilities are needed to reduce the negative repercussions of the COVID-19 pandemic once the borders open and the tourism sector starts rolling in PICs (Research Association of New Zealand 2020). Scenario planning and provision of information are essential to support the successful implementation of tourism industry recovery plans. There is also immediate support needed in the form of microfinancing schemes to help the businesses rejuvenate and survive the negative economic repercussions of the crisis (Research Association of New Zealand 2020). The long-term approach should be inclusive of new sectors, where appropriate technologies can be adopted by PIC businesses where small-scale productions become globally competitive. These must be based on cleverly crafted sectors where PICs has strategic advantages.

Furthermore, businesses can be provided tax concessions and reductions in the national provident fund contributions to enable ailing businesses to address their financial losses during the crisis. The reduction in employer and employee contributions to the National Provident Fund needs immediate review, and any ad hoc policy change should be avoided. Such decisions need long-term perspectives based on decisions inclusive of stakeholder perspectives. Well-planned policies are needed that takes into considerations the social and economic conditions of the country in the long-run perspective.

These small PICs also need concerted financial policies that are sustainable in the long run and internally consistent. The financial system should be strengthened in such a way that the institutions can operate with greater flexibility and a constructive model. The banks should be empowered to provide concessional loans to businesses during such a crisis. Such loan facilities should also cover micro, small, and medium enterprises where only public sector lending exists. In addition to providing loans, the banks and financial institutions should also absorb financial risks with government fiscal support.

PIC governments need to reconsider their trade policies to build capacities both toward niche sector exports and imports substitution. Here, two-pronged development approaches are needed – (1) to restructure productive capacities and (2) restructure domestic consumption by social engineering. This involves multi-dimensional investing with a strong focus on rural development, high-value agriculture, agri-business, and new farming techniques.

## Conclusion

In summary, the COVID-19 health crisis has devastated the Pacific island economies, with most of the impact on the domestic economy flowing from the decline in the tourism industry, international trade, remittances, and commodity prices. This entry argued that the decline in the tourism industry of Fiji, Solomon Islands, and Samoa is driven by the closure of the international borders, limited ship access to trade, and the quarantine period. Fiji is experiencing a greater economic shock as compared to the Solomon Islands and Samoa. In late March, the Fiji Hotels and Tourism Association announced that around 93% of its members had closed their operations due to a sharp decline in the tourist numbers. From January to March 2020, the tourism industry of the Solomon Islands has recorded a decline of 50% in average monthly revenues (Lilomo 2020). The Visitor Earnings and Remittances Report for March 2020 showed that the visitor arrivals in March 2020 to Samoa have decreased by 62.7% as compared to the visitor arrivals in March 2019 (Fruean 2020).

# Impact of Government Experiences on Management Skills of Russians

Natalia Ermasova[1] and Sergey Ermasov[2]
[1]Public Administration, Governors State University, University Park, Chicago, IL, USA
[2]Saratov State University, Saratov, Russia

## Synonyms

Conceptual skills; Human skills; Technical skills

## Definition

Management skills are the skills that are necessary, the attitudes that are important, and the intellectual capabilities that are essential to be a global leader.

## Introduction

Managers with different cultural backgrounds may vary in their conception and expectations of leadership. Many scholars provide research evidence that national cultures vary and that strategic management, managerial skills, and leadership vary across national cultures. It is important global leaders understand the significance of leadership and cross-cultural awareness and practice.

In the beginning of the 1990s, the managerial styles and orientations in the post-Soviet Russia were often seen as largely homogeneous. Russian managers were portrayed as avoiding risk and accountability, lacking initiative, and mistrusting others (May et al. 2005). Many scholars suggest that there is an authoritarian management style in Russia (Elenkov 1998; Kets de Vries 2001). These studies find that the Russian style of leadership tends to be centralized and directive. Companies are complex bureaucracies with top-down decision-making style (Ageev et al. 1995). However, Ehrnrooth and Koveshnikov (2015) propose that managerial styles and orientations are becoming more heterogeneous in Russia. Ardichvili and Gasparishvili (2001) suggest that diversity of organizational, industrial, and professional cultures in contemporary Russia brought great heterogeneity in Russian managerial styles. Astakhova et al. (2010) find that the heterogeneity of managerial styles in Russia increased due to evolving generational differences between managers in terms of their age, education, and work experience. Following scholars suggest that there is a new generation of managers coming to the forefront in Russia (Astakhova et al. 2010; Grachev et al. 2008; Nguyen et al. 2014). Tan et al. (2007) propose that during the transition to a market economy, the Russian workforce underwent a period of change with excess supply of some industrial skills coexisting with conceptual skill shortages by many enterprises. Ehrnrooth and Koveshnikov (2015, p. 22) find that "at least these 33 percent of the managers (the performance-oriented ones) exhibit a relatively low degree of transactional control orientation. These managers seem to be relatively closer to, and may to different degrees be moving toward, a more transformational management style." McCarthy et al. (2010) suggest that Russian managers adopt some "western" orientations while rejecting others and reject some traditional Russian orientations while save other ones.

## Managerial Styles in Russian Organizations

Management authors present three different types of managerial skills, which include technical skills, human skills, and conceptual skills. Technical skills are related to worker's specific area of expertise and created from the combination of formal education, training, and on-the-job experience that used to perform a particular job, such as writing a computer program, running the latest software, developing a budget, or analyzing sales trends. Human skills are worker's ability to effectively interact with others and formed from interpersonal skills what a manager uses to work with his or her employees. Managers with good human skills understand how important things, like trust, cohesion, fairness, empathy, and good will, are to the overall success of the organization. Human skills help the manager to communicate, understand, alter, lead, and control the behavior of people and motivate an employee to work toward a higher level of productivity.

There are two distinct managerial styles in Russian organizations: Soviet era executives and new entrepreneurial managers (Grachev et al. 2008; McCarthy et al. 2010). Ermasova et al. (2017, p. 75) conclude that the most effective Russian manager is "an administratively competent manager, capable of making serious decisions and inspiring his/her followers to meet performance targets." Ehrnrooth and Koveshnikov (2015, pp. 20–21) identify several managerial styles rather than one culturally specific profile of Russian managers: (1) paternalistic managers, (2) exploitative managers, (3) performance--oriented managers, and (4) passive managers. Paternalistic managers are recognized with "high scores on being supportive but relatively low scores on exhibiting a strong voice vis-à-vis their own superiors, taking initiatives and assuming responsibility, as well as medium on the employee empowerment orientation and the authoritarian orientation" (Ehrnrooth and Koveshnikov 2015, p. 20). Exploitative managers are distinguished by a high score on authoritarian self-sacrifice and a low score on the employee empowerment orientation while also scoring relatively high on having a voice and taking responsibility. The performance-oriented managers score high on employee empowerment orientation, high on exhibiting a strong voice vis-à-vis their own superiors, and assuming responsibility and taking initiatives, low on being authoritarian and medium on being supportive. They are most likely to pursue further education and skill development. Overall, they seem to represent a "western" style of management. The passive managers have low scores on the responsibility-taking orientation, relatively low scores on being supportive and democratic, and relatively low scores on authoritarianism (Ehrnrooth and Koveshnikov 2015, p. 21).

Managerial skills are what managers use to assist the organization in accomplishing its goals. Management scholars present three different types of managerial skills, which include technical skills, human skills, and conceptual skills. Technical skills are the combination of formal education, training, and on-the-job experience that managers use in order to perform a particular job, such as writing a computer program, developing a budget, or analyzing sales trends. Human skills are interpersonal skills that managers use to work with their employees. Managers with good human skills understand how important things, like trust, cohesion, fairness, empathy, and good will, are to the overall success of the organization. Human skills help them to communicate, understand, alter, lead, and control the behavior of people and motivate employees to work toward a higher level of productivity. The conceptual skills are the final type of skills that give managers the ability to analyze a situation and distinguish between cause and effect. Jones and George (2009, pp. 17–18) suggest that "conceptual skills are often gained through formal education, reflection, and experience." The proportion of one's time spent in these three basic managerial skills may change as managers go up the hierarchy. "Modern managers of a cross-cultural workplace should be able to use relevant management skills if their organizations are to remain competitive" (Mujtaba and Kaifi 2010, p. 4). McDaniel et al.

(1988) find that the correlation between job experience and job performance is moderated by two variables, length of experience and job complexity, and suggest that "for all levels of job experience and for both low- and high-complexity jobs, the correlation between job experience and job performance is positive" (McDaniel et al. 1988, p. 329). The most important criteria on personnel recruitment are education, practical working experience, psychological compatibility, and ability to work in collective environment.

## Conclusions

Russians are more pragmatic, which means that the people maintain some connections with the past while facing the challenges of the present and future. Russians can adapt easily to changed conditions, and they believe that the truth depends on the situation, context, and time. Managers and business owners should assign an adequate amount of work that matches skills and qualifications to make workers feel capable of performing their jobs and not too overwhelmed. They should also create and foster a collaborative and supportive work environment to improve the communication as well as relationships among peers, leaders and subordinates, and other work units. The success of managers is provided with the purposeful development of the personality according to his advance in the organization.

This present study has several important implications for western managers, who, as potential partners and collaborators of their Russian counterparts, need to understand that there are differences between managers in Russia depending on historical roots of the organization, manager's working and managerial experience, mode of recruitment, and engagement in professional skill development. According to Desai and Goldberg (2006)'s Competitiveness and Investment Climate Assessment for the Russian Federation, labor skill is one of the main obstacles for all firms in Russia, and lack of skilled labors is a primary constraint on enterprise growth and development. Globalization and diverse workplace development provide a challenge and an opportunity for organizational growth and development of managerial skills.

The study by Ermasova et al. (2017) found that different work experience, managerial experience, and government experience types of job experience impose constraints on the different types of managerial skills of working adults in Russia. This study proves that work experience, management experience, and government experience are significant factors in their technical, human, and conceptual skills. Human skills scores are significantly higher for all groups than group with no management experience. The score for human skills increased with years of government experience only, but not with working or management years of experience.

Today's managers must possess great managerial skills, i.e., technical, human, and conceptual skills, in order to build strong organizations with appropriate structures to implement their strategies successfully in this globalized world of business. The study by Ermasova et al. (2017) has pointed out that experienced employees have better managerial skills that can lead their organizations to success. Therefore, providing managerial skill's training early in their careers will help prepare them to make good managerial decisions sooner for the organizations.

# Impact of Law on Public Administration

Ali Farazmand
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Administration of the public sector; Executive orders; Judicial rulings; Legal procedures; Legislation; Oversight of administration; Public management; Regulations; Rules

## Definition

Public law: A body of law that is concerned with the actions of legislative institutions, judicial courts, administrative agencies, independent institutional organizations and commissions, and executive orders; a body of law that affects society in all areas of concern; a body of laws enacted by people that affects society or societies.

Administrative law: A body of laws concerning administrative agencies and organizations; a body of rules and regulations, with procedures to be followed to implement laws.

Legislative law: A body of law that is concerned with legislative organizations/entities, commissions, etc.

Executive law: A body of constitutionally legitimated executive orders and actions that is concerned with the governance of a land domestically and internationally.

Judicial law: A body of judicial rulings and court orders that is concerned with the governance of the land, constitutionality of legislation, and administrative agencies' actions.

Constitutional law: A body of laws that is concerned with the Constitution and constitutionality of actions taken by all branches of government, private groups, and citizens in society.

Constitution: The highest legal document with subsequent amendments that operates as the law of the land, one that is concerned with all issues and matters of governance in society, privately, publicly, locally, nationally, and internationally.

## Introduction

All nations and societies are governed by laws, and all institutions operate by rules, formal and informal. Laws and regulations affect all areas of

society, economy, politics, government, and military and civilian organizations. They also affect public as well as private business and nonprofit organizations and their administration. No laws and no order, and chaos would rule, a condition which eventually leads to order over time, followed by laws and rules. This short entry essay outlines the key areas of laws and the impacts of law on public administration. This is organized into several sections: first, sources and types of law are presented. The second section covers the nature of laws, followed by a discussion of regulations in the third section. Then, section four explains the dynamic relationship between law and public administration, and the other way around. Finally, the impacts of law on public administration are outlined and explained, followed by a brief conclusion.

## Sources and Types of Law

Laws are enacted or generated from a multitude of sources, but primarily they come from four major venues: legislative, judicial, executive, and administrative. Legislative laws are enacted by an elected body of representatives in a parliament or congress composed of either a single or double body – unicameral or bicameral. The latter is a lower house and an upper house, called a senate. Examples include the US bicameral Congress of the House and Senate and post-revolutionary Iran's unicameral Parliament or Majles. Also called statutory laws, legislative acts are often required to be approved by the highest executive authority, normally an elected president, who may have a constitutionally authorized veto power. Once approved, statutory bills become laws of the land unless declared unconstitutional by the Supreme Court, the highest legal body of the land.

Judicial laws are a body of court rulings affecting society, and the rulings and decisions of the highest court, the Supreme Court, of a nation are considered final. While decisions and rulings of lower courts can be appealed to and settled by the Supreme Court, the latter's rulings and decisions are considered irreversible. However, they can be overturned through new statutory laws. Variations may be found in some societies, for example, in France, or the United Kingdom, or post-revolutionary Iran where the national legislative acts/laws are reviewed by a higher governing Guardian Council, *Showra-ye-Neghban*. Court rulings become laws of the land when disputes and conflicts among different branches of government or between citizens and government entities are resolved by the highest court. An example is the landmark Supreme Court ruling of the United States in the cases involving racial segregation, *Brown vs. Board of Education* of 1954, in which the court unanimously ordered an end to the long-practiced racial segregation against blacks.

Constitutional law is considered the highest law of the land, the "mother law," one that is the ultimate source for all other laws. It is a document that governs the land and is amended time to time to reflect the needs of the society and reflect the changing conditions domestically and internationally. Constitutional law is a body of law that is concerned with the legitimacy of all other laws, the rights and responsibilities of public employees, citizens, and private and public governing institutions. While 33 amendments have been proposed by the US Congress, only 27 have been ratified since the operation of the Constitution on March 4, 1789 – these amendments are parts of the Constitution now. Changes and amendments to the Constitution also affect other laws of the land, including administrative law.

Not all countries have Constitutions, however. How do they operate then? These countries, a handful in number, for example, the United Kingdom, do not have a constitution. They operate with common law, relying on cases and precedents of the past. Countries like Canada and Australia do not have a constitution either, but are still under the "sovereign power of the Queen of England," which means all peoples of these two countries are "subjects," not "citizens" of the Sovereign Queen. Constitutions can be short or long. Some countries like India have the longest constitutional document as opposed to the US Constitution which is fairly short in length (Rohr 1989).

Executive laws are executive orders issued by the president of a nation and/or governor of a state

authorized by constitutional power. Executive orders become laws once issued, and they are often nonreversible. Examples include two executive orders that President John F. Kennedy of the United States issued in 1962, legalizing the right to unionization by public employees (Rosenbloom 1983; Rohr 1989).

Administrative law is a "body of law that is concerned with the actions by administrative agencies" (Cooper 1983: 5). This definition may be insufficient or misleading because laws and rulings made by other sources, say the president or governor, or by legislative organizations, as well as independent commissions regarding administrative matters, the bureaucracy, and public employees or agency-citizen relations, may also be considered part of administrative law.

## Nature of Law

Laws serve different purposes and their nature varies from issue to issue, sector to sector, and problem to problem, as well as nation to nation. Generally, laws may be categorized as (a) prohibitive laws, (b) permissive and enabling laws, (c) sanctioning or punitive laws, (d) conditional or conditionality laws, or (e) a combination of the above. Prohibitive laws aim to prevent or stop from happening certain actions by individuals or institutions. Examples include the Hatch Acts of 1939 and 1940 passed by the US Congress that prohibited federal and state and local public employees from engaging in "partisan" political activities, hence protecting employees against partisan abuse of employees by political bosses and keeping employees away from such activities as political campaigns. The examples also include laws against illegal immigration, the anti-discrimination Civil Rights Act of 1964, and laws against prostitution and human trafficking or use of illegal or illicit drugs.

Permissive laws, on the other hand, aim to promote ideas, actions, and developments by individuals, institutions, and government organizations. Examples may include environmental clean air or water acts, the Civil Service Reform Acts of 1883 and 1978, and the Executive Orders of 1962 by President John F. Kennedy in the United States granting public employees the rights to form unions and meet and confer with their employer, agency administrators, or state legislative charters granting local government entities delegated power to decide on their local taxation, forms of government, and similar matters.

Sanctioning or punishing laws are those that aim to restricting, confining, mitigating, or simply punishing certain actions or behaviors or removing certain conditions. Powerful nations pass legislation imposing sanctions against other nations or individuals to remove certain conditions or change behaviors. Traffic control laws aim at those violating traffic rules and regulations and intend to promote safety on roads and highways. Conditionality laws tend to promote and encourage certain behaviors and actions while punishing those refusing to comply. Examples include intergovernmental categorical grants-in-aid to local and state governments in the United States to change and modify state and local government policies and actions with regard to diversity, anti-discrimination, equal opportunity, respect for minority rights, highway beautification, and implementing national laws of speed limits to save lives and energy.

Refusal to comply with the highway beautification measures by states would lead to loss or withholding of federal funds for the purpose of safety, or lack of compliance on federally legislated speed limits on interstate highways could result in the loss of grants-in-aid for highway beautification. These are called "cross conditions" and "crossover conditions" imposed by the federal government over states and local governments in the United States (Wright 1982). While cross conditions simply are conditions for either eligibility or promise of compliance with certain conditions to receive federally legislated grants-in-aid in the form of categorical grants-in-aid (e.g., education), crossover conditions expand to other areas of fund support.

Laws that combine the permissive and prohibitive or conditionality dimensions may include the Civil Rights Act of 1964 in the United States. It aims to serve all three purposes above: Title VII of

the law prohibits any form of discrimination by government agencies and private employers with a minimum number of employees against anyone for employment or promotion on the basis of religion, color, race, gender, and national origin (Rosenbloom 1983; Klingner et al. 2010). The law also offers equal opportunities to minorities, women, and anyone eligible for employment or promotion within agencies and nonprofit organizations across America and encourages hiring institutions to announce as a requirement to promote equality of opportunity and inclusion (ibid.).

The Equal Employment Opportunity Act of 1972 passed by Congress also took further steps by requiring government, nonprofit, and even profit organizations to correct the past incorrect employment actions by developing formal affirmative action plans with timetables, quotas, and implementation measures to do more than merely encourage and promote hiring and promotion of minorities and women in workplaces. It also gave the Equal Employment Opportunity Commission power to take noncompliance cases and agencies directly to court to enforce the law. Institutions failing to comply or simply violating the anti-discrimination laws can be taken to court (sued) by both individuals and the Commission, seeking sanctions, fines, and remedies.

Administrative, employment, and constitutional laws often overlap when employees' rights and responsibilities are at stake. Public employees are protected by their constitutional rights to free speech and expression (with the limit or exception of partisan speech), equal treatment, freedom of association, freedom of religion, and the like. They are also protected by constitutional rights to "procedural due process," and "substantial interests" to their employment, and cannot be subjected to arbitrary agency or managerial actions, such as dismissal, transfer, demotion, or termination (ibid.).

## Regulations

Like laws, regulations are created to promote purposes, achieve goals, and prevent potential or anticipated harm to society. The purposes of government regulations vary and may range from securing safe drinking water or providing a safe workplace environment to environmental hazard controls, election processes, or safety of food and drugs produced and marketed. They can serve to prevent hostile business take-overs and business monopolies and protect domestic business enterprises against foreign competition.

Generally, regulations are produced by two sources: legislatively and/ or administratively. Sometimes, legislatures pass specific regulations in details to control and monitor implementation of certain laws by administrative agencies. Although this is not a common practice, it does happen, especially when two different and opposing political parties are in control of the legislative and executive branches of the government. More often though, when legislators pass laws in Congress (USA) or Parliaments in European and most other nations, the language of the laws are generally broadly crafted and is not specific with details. This is due to the fact legislators do not often have time or do not want to get involved in the details of laws. Other reasons could be the extensive lobbying forces surrounding specific legislatures, forces that try to have vague laws passed so they can influence administrative agencies to make discretionary interpretations of laws in their favor.

Thus, legislatures tend to delegate this regulative or rule-making task to independent regulatory agencies within the executive branch tasked with a specific mission, for example, the Environmental Protection Agency (EPA) or Food and Drug Administration (FDA). These agencies are created by legislatures and can often be dissolved only by legislatures, though the president or chief executive such as prime minister in a parliamentary system can play a major role in proposing appointments, etc.

All institutions operate with rules, formal and informal, and all newly passed laws in order to be implemented must be interpreted first to determine their "intent," and then rules are created for implementing those laws. Therefore, interpretation is a major function performed by administrative agencies to determine the "intent" of the new last passed by the legislature. Rule-making

follows the interpretation function. Rule-making is a major legislative function of executive agencies, and rules must be also enforced, and enforcement means administrative or executive function. If rules and regulations are violated, investigations are required by the regulative agencies to determine what penalties apply – hence a judicial function of administrative agencies, also called "adjudicative" function. Thus, independent regulatory agencies within the executive branch of a government play three fundamental roles simultaneously: legislative, executive, and judicial. Examples of such agencies include Occupational Safety and Health Administration (OSHA), EPA, FDA, Federal Communication Commission (FCC), and many more.

In short, regulations and rule-making constitute parts of the legal environment in which government, business, and nonprofit organizations operate. Political parties and forces are often divided by political philosophy as well as by their ideology on the nature and extent of regulations. The Conservative Right political parties often tend to minimize the number of regulations, saving only those that tend to protect business enterprises from foreign or hostile competitors. The Leftist political parties, on the other hand, prefer more regulations to protect society and the poor and disadvantaged and promote more social equity and fairness in service delivery to the public. Ronald Reagan once elected cut the number of federal regulations immensely and devolved the task of regulations to state governments in the United States. Similarly, Margaret Thatcher once elected as Prime Minister of the United Kingdom did the same thing there. Regulations have similar effects on public administration as do laws.

## Law and Public Administration

What is the relationship between laws and public administration? Which one comes first, law or public administration? Answering these questions requires extensive volumes of explanations. There are those who argue that long before the advent of laws, societies and empires were organized and managed by public administration systems. Example include the ancient Empires of Persia and Rome and other powers like Babylon, China, Sumer, Elam, and Egypt, to name a few. Most ancient civilizations had elaborate administrative systems before turning to laws, although the latter were also necessary and hence proliferated. Generally, laws followed the elaborately designed and developed public bureaucracy and administrative systems (Farazmand 2009).

Several views may explain the relationship between law and public administration in contemporary nations. One view holds that public administration is the machinery of government and is tasked to execute laws. This view reduces public administration to simply an implementation of policy and law agent. The statist view, on the other hand, considers public administration as an important function and process of carrying out the "state" role in society. Generally, this is the view held in European and most developing nations (Rohr 1989). The Americans have developed over the last two centuries a different view. The concept of "state" has not received a favorable reception, and instead they use the term government, with a limited role in society where the private sector, particularly individual citizens, is considered more important, with the latter forming various associations, including professional ones, to run society and manage their affairs (Rohr 1989). Public administration has come to play a "public service" role rather than serving the state. This concept masks the reality that government and its institutions – military and civilians – are pillars of the State, hence an illusionary view, but one that is psychologically comforting.

The concept of "administrative state" rose as the federal government and its bureaucracy became bigger, and its largess affected almost every aspect of life through the exercise of "specialized knowledge or expertise" during most of the twentieth century, but then attacks from every direction came to dismantle it (Farazmand 1989). Privatization, outsourcing, and contracting out became the norms since the market-based reforms began in the 1980s. The result has been the diminution and reduced size as well as functions of public bureaucracy and administration. Today,

discussion of bureaucracy rarely appears in scholarly journals. The reality is a mix, however – public administration helps create new laws by performing good or bad, and laws produce more tasks for public administration; it is a two-way street (Farazmand forthcoming).

## Impact of Law on Public Administration

How does law affect public administration? This is a complex question and requires complex and extensive answers. In short, the impact of law on public administration may be explained in several ways:

1. Implementation. Laws have to be implemented, and to implement laws, institutional mechanisms – organizations, rules, procedures, processes – are needed, and this can cause an overburden on public administration requiring new agencies or simply expanding the functions of the bureaucracy or its role in outsourcing and contracting out. Even privatization would require administrative supervision or oversight, because at the end of the day, it is the government agencies that must be accountable to the public/citizens. Thus, this may work both positively and negatively with regard to public administration.
2. Constraining Effect. Laws affect public administration by constraining public agencies, particularly on their exercise of "administrative discretion" by public administrators. Laws have specific purposes to serve, one of which may be limiting the role and functions, and discretionary powers of public administrators by being more specific and detailed for implementation purposes. In doing so, lawmakers try to act like public bureaucrats exercising expertise, but the reality is they are no match to expert administrators, particularly on matters of science and technology. Privatization and outsourcing, for example, may seem an easier task, but not so as sophistications develop as the issues of accountability and business motivation of profit only come to play as key factors. The Freedom of Information Act is another act requiring administrative agencies to make available information the public may request – administrative agencies have many ways to fight back and frustrate laws. Yet public administration has been contracted out and shrunken since the 1980s, while business administration has grown exponentially. Constraints on public administration are also felt by a mechanism called "oversight."
3. Oversight. Oversight of public administration is exercised by several sides: it comes through legislative oversight – legislation and congressional hearings, investigation, and possible impeachment by legislative bodies. It also comes from the judiciary, called judicial oversight of administration, and the courts, particularly the Supreme Court in the United States, have been very active since the 1930s in its scrutiny of administrative agency actions, intervened in cases taking power away from them and declaring certain actions unconstitutional (Rosenbloom 1983). Additionally, executive oversight of the administration by the president and through other legal investigative offices keep public administration checked and accountable.

As the head of the executive branch of the government, the elected president is in fact also the chief bureaucrat in charge of the executive bureaucracy and administrative system, but he/she is also a politically elected official that has total control of agencies under his administration. Presidents have enormous power and instruments to exercise it. For example, the Office of Personnel Management (OPM) directly under the president's control has since the Ronald Reagan presidency in the 1980s played a powerfully instrumental role in implementing the president's policies with regard to public employment, unionization, reductions in force, politicization and depoliticization of the bureaucracy and civil service, and more. OPM has been curtailing administrative discretion by direct intervention and through appoints of partisan Schedule-C employees and supervisors for partisan political control of career employees and administrators.

The elective executives and politically appointed officials also have a lot of power over administrative agencies; they use it through supervision, oversight, and reorganization of administrative agencies as ordered by the president.

An important feature of the oversight function over administrative agencies or bureaucracy has been the legislative and judicial oversight. Legislatively, the Congress in the United States and Parliaments in other countries tend to exert as much oversight power over the administration as possible. As noted earlier, lawmakers do this by a variety of means, including the confirmation hearings of politically appointed administrative elites, by investigations into administrative agency actions, by impeachment processes, and by examinations and hearings of agencies' proposed budgets, policy proposals, and the like. These activities of the Congress in the United States eventually lead to the "bureaucratization" of the legislature, through which the Congress created its own expert bureaucracy to counter the agencies expert power.

On the judicial side, the US Supreme Court took an aggressive oversight position over the administrative agencies since the 1930s' New Deal policies instituted by President Roosevelt, who created many agencies outside the federal civil service system. The Court's adversarial posture of intervention went so far as to take over some agencies or offices ruled as failing to do their intended job – e.g., running mental hospitals, or rehabilitating juvenile inmates, or running public schools (Rosenbloom 1983). In short, the judicial oversight of the administrative state and of public administration reached its height during the Warren Court in the 1950s and 1960s, when the administrative state had reached its highest strength.

Judicial oversight of public administration can and should also be understood by the constitutional doctrines that the Supreme Court of the United States developed through numerous legal cases it has ruled on with regard to administrative agencies over the last two centuries.

Constitutional Doctrines: The relationship between the US Supreme Court and the administrative state and public administration during the twentieth century and before was generally moved along four major constitutional doctrines (Rosenbloom 1983):

1. Constitutional Doctrine of Privilege. Throughout the nineteenth century and up until 1950s, the constitutional doctrine of "privilege" was a prevailing norm by which holding public employment was considered a "privilege," not right. In *McAuliffe v. New Bedford* 1892: 220, Justice Oliver Wendell Holmes held that "The petitioner may have a constitutional right to talk politics, but he has no constitutional right to be a policeman." This ruling continued to prevail in 1951, when the divided court held in *Bailey v. Richardson* (1950: 58–59), and later on, that "due process of law" was not applicable "unless in situations" in which public employees have a "right" and that the "plain fact is that so far as the Constitution is concerned there is no prohibition against the dismissal of Government employees because of their political belief, activities, or affiliations" (quoted in Rosenbloom 1983: 115–116).

   Consequently, employees of the government bureaucracy could be fired at will without any due process or cause, as the privilege could be taken away at any time and at the mercy of their bosses. Government was considered absolutely "immune" and no one could sue the government. The doctrine of privilege left no room for public employees, and those of citizens, being able to bring a lawsuit against government – governments enjoyed "absolute immunity."
2. Doctrine of Substantial Interests. The doctrine of substantial interests was established over almost two decades since the 1950s, during which numerous court cases reached the US Supreme Court under Chief Justice Warren who was sympathetic to employees' rights, due process of law, and overserving the "national purpose." Justice Warren allowed many cases handled by the court, cases that challenged administrative agencies' arbitrary decisions against employees of the government. The court's many rulings in favor of employees' concerns established a new doctrine called the Doctrine of Substantial Interests, based on the arguments that, while public employees may not enjoy a "right" to their jobs, they do have "substantial interests" to their employment and therefore are entitled to procedural "due process of law" and "a right to be heard with regard to

the 'substantial interests'" they may claim to have on their jobs as a source of living (*Birnbaum v. Trussell* 1966: 678). For example, after several other cases of the 1950s and 1960s, in *Board of Regents v. Roth* (1972: 571), the court stated that it has "fully and finally rejected the wooden distinction between 'rights' and 'privileges' that once seemed to govern the applicability of procedural due process rights" (quoted in Rosenbloom 1983: 120).

3. The Doctrine of the Case-by-Case Approach. The appointments of President Nixon changed the composition of the Supreme Court, turning it into a less and actually unsympathetic court toward public employees of the bureaucracy. Often dubbed an "Imperial Presidency," Nixon signaled an antiunion, anti-public employee posture, which resulted in fewer and fewer cases reaching the Supreme Court under Chief Justice Burger. The doctrine of the case-by-case approach to dealing with administrative agencies and public employees further led to the further downturn of the relationship between the court and the bureaucracy and administrative behavior in favor of the court's tendency to "increase the scope of judicial review of public personnel actions." The courts across the land "broadened the scope of judicial review to determine whether the administrative findings were capricious, arbitrary, unreasonable, or unsupported by the record" (*West v. Macy* 1968: 105; quotation from Rosenbloom 1983: 124). This was an "idiosyncratic" period in judicial oversight of public administration.
4. Deconstitutionalization Doctrine. The period of the 1970s and beyond has characterized the judicial review of public administration as "deconstitutionalization," a characteristic that some scholars note and this author agrees with (Rosenbloom 1983; Farazmand forthcoming). The US Supreme Court under Chief Justice Burger took a hard-line position against the cases reaching the bench and held that their 19,000 plus cases "must be reduced to what they were a generation ago" (*New York Times* 1975: 31). The Court refused to take on cases and deconstitutionalized government employee-employer relations and referred them to administrative law judges within the agencies of the bureaucracy. As Rosenbloom notes, "Deconstitutionalization is an exercise in judicial restraint concerning public personnel administration" (124).

   Today, administrative judges decide on most cases involving disputes between public managers and government employees, and it seems obvious to many observers that the former are often favored in the rulings. Yet the overall picture of this delegated authority by the US Supreme Court to "administrative judges" produces at least two major impacts on public administration and the bureaucracy as a whole. One effect is the fact that administrative agencies are now playing more judicial roles as well as administrative roles as they did before under the previous doctrines. Another effect is that public administration has developed a more specialized power, judicial power, versus the courts that may challenge them in cases. The ability of administrative judicial power expertise countering the courts' authorities may in the long run benefit public administration as a professional enterprise. Yet the courts across the land have also adopted, like their legislative branch has since 1970s, a new approach toward the administrative state and public administration bureaucracy – that is the bureaucratization of the court systems to counter the power of the bureaucracy. Thus, today, courts operate like most bureaucracies with few judges on the bench and an army of administrators and bureaucrats – hence the delicate relationship between the judiciary and public administration increases (Farazmand 1989, forthcoming).
5. Characterizing the Impact of Law on Public Administration. Several features may characterize the effects of laws and judicial oversight on public administration. These are tentative and open to improvement:
   (a) Primary and Direct Impacts: Most laws, judicial rulings, and executive orders have direct impacts and intend to produce immediate results, either in the form of relief or remedies or promises of such results. For example, US President Donald Trump's first day executive orders included immediate "freeze of all federal hiring" on

I

Monday, January 23, 2017. Also, the Civil Rights Act of 1964-Title VII had both impacts as a legislative intent, or halting discrimination, promising to improve and produce balances in employment practices. Public administration in general and public agencies in particular operate by laws. Hence laws have direct impacts on public administration, no matter whether it is tasked simply to implement laws as a powerless institution or process to implement laws or as a powerful institution of government capable of exerting power and influence of its own on what kinds of laws to be passed, not to mention on how to implement them. The latter view has called the bureaucracy as the "Fourth Branch of Government" (Meier and Bothe 2007).

(b) Secondary and Indirect Impacts. All laws and regulations have indirect and secondary effects on society and public administration as well. Any public law implemented creates public values, and public values often transcend generations, ages, races, colors, and peoples of different belief systems. Creating a safe urban environment by implementing security and safety laws would generate not only direct and indirect but multiple and general impacts on society, community, people, and the system of order and security.

(c) Social and Economic Values. Impacts of laws also generate economic and social mobility values to younger generations, who would most likely develop more positive and self-efficacy attitudes towards society, government, and laws as well as public administration.

## Conclusion

The relationship between law and public administration is complex. There is a mutual interrelationship in structures, processes, and outcomes. New laws necessitate creation of new or expansion of existing administrative structures and processes for implementation, while old laws require continuity of action to produce results. Public administration, on the other hand, promotes cognitive features of laws and enhances or limits the application of law depending on the nature of laws. Public laws have direct and indirect consequential impacts on society, and the impacts of laws on public administration are enormous. Whether as implementation of law or an initiator of laws, public administration is affected by a multitude of laws – everything public administration does involves laws. The impacts of laws on public administration are explained in many ways. This includes legislative, judicial, and executive oversight of public administration, agencies, actors, and processes.

While the judicial constitutional doctrines noted above have differential effects on public administration and the administrative state, legislative oversights often have mixed and delegated configurations in structure and process, one of which is the delegated extension of regulatory as well as interpretive and rule-making authorities to administrative agencies. Similarly, judicial delegation of adjudication authorities by the Supreme Court (in the United States) to administrative law judges in agencies extends public administration's judicial role in governance. While "judges are by nature generalists," most public administrators are "specialized" (Rosenbloom 1983: 50). This means, among other things, public administration is not a totally powerless, passive implementing tool at the disposal of elected politicians. Public administrators are able to exercise discretionary expertise power to further broaden the public interest. Further, the fact that both judicial and legislative branches of government have been extensively bureaucratized with expertise to deal with the professional bureaucracy and public administration indicates the viability and power of public administration to impact the laws and lawmakers, whether in the legislature or judiciary. And this is a beauty of an increasingly dynamic complexity in the relationship between the modern administrative state and law and lawmakers in the contemporary governance world.

# Impacts of Freedom of Information Act on Accountability and Corruption

Ramesh Ramasamy
Department of Political Science, Faculty of Arts, University of Peradeniya, Kandy, Sri Lanka

## Synonyms

Access to information; Bribery; Good governance; Responsiveness; Right to information; Transparency

## Definition

Freedom of information is fundamental human right of a citizen to access information held under the custody of public and political institutions, and it enables citizens to be informed on their government functioning and empower them to hold government officials and policy-makers accountable, transparent, incorrupt, and responsive.

## Introduction

Although the empirical evidence with regard to the impact of freedom of information (henceforth FOI) laws on corruption, service delivery, and accountability is limited, there are some evidence that suggest how FOI laws and access to information have helped citizens to fight bribes and corruption, disclose such acts, and prevent the mismanagement of public money (Martini 2014). The fundamental objective of the FOI Act is to empower the citizens, promote transparency and accountability in the working of the government, contain corruption, and make democracy work for the people in real sense. It goes without saying that an informed citizen is better equipped to keep necessary vigil on the instruments of governance and make the government more accountable to the governed (Ansari 2008). The Act is a significant step toward making the citizens informed about the activities of the government. FOI refers to the right of every citizen to access information held by or under the control of public authorities. Information is crucial for good governance as it reflects and captures government activities and processes (Mori 2013). It is said that information is the oxygen of democracy. If people do not know what is happening in their society or government, if the actions of those who rule them are hidden, then they cannot take a meaningful part in the affairs of the governance. Access to information not only promotes openness, transparency, and accountability in administration but also facilitates active participation of people in the democratic governance process (World Bank 2004; UNDP 2006).

The FOI Act enables the establishment of an unprecedented regime of right to information for

the citizens of the country. It overrides the "Official Secrets" and similar laws/rules. The Act seeks to establish that "transparency is the norm and secrecy is an exception" in the working of every public institutions. It aims to ensure maximum openness and transparency in the machinery and functioning of government at all levels: central, provincial, and local. The right to information is expected to lead to an informed citizenry and transparency of information which are vital to the functioning of a democracy (UNDP 2006). It will contain corruption and enable holding governments and their apparatus accountable to the governed. The "People's Right to Know" has remained a main pillar of democracy. Article 19 (2) of the "International Covenant on Civil and Political Rights" (ICCPR) states: "Everyone shall have the right to freedom of expression; this right shall include freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media of his choice." This indicates the significance of right to information. Instances are there where citizens have long been excluded in governance structures, namely, in service delivery for various reasons; therefore, they have substantially been disadvantaged in the sphere of social development, subjective human well-being, education, health, and other sectors (Ansari 2008; Surie 2011; Dokeniya 2013). Though there are notable improvements in governance process in developing societies, yet citizens encounter untold hardships and hindrances in obtaining public services and often denied with information for various services which is more likely to result in discriminations, ill treatments, unfair service delivery, and other forms of exclusions by public officials and institutions (UNDP 2006). The process of governance encompasses the political, social, and economic aspects of life which have an impact on each individual, household, village, region, or nation. Good governance is the equivalent of purposive, development-oriented, citizen-friendly, citizen-caring, participatory, and responsive public management committed to improvement in quality of life of the people (Surie 2011). It entails equity in access to public services, participation of all stakeholders in service delivery process, holding public officials accountable, as well as their full access to information. There are two different terms used for this Act such as right to information (RTI) and freedom of information (FOI). Both RTI and FOI are used in literature and legislation to refer to citizens being able to access government information – some countries have RTI acts and others have FOI acts. However, FOI is wider in scope referring not only to the right to seek and receive information but also to the right to impart information and thus includes freedom of opinion and expression.

Freedom of information has rapidly gained acceptance across the world. In 1990 only 13 countries had some form of right to information or freedom of information legislation. Today 128 countries have such laws (see www.rti.rating.org). This is a huge and very rapid expansion. Among the countries that have RTI/FOI legislation, many are from the developed countries: the United States, Sweden (the first country to have such a law), the United Kingdom, Canada, New Zealand, Japan, Germany, and so on. But increasingly, it is the countries from the *developing* world – particularly Eastern Europe (the former Communist Bloc countries) and South America – that are adopting RTI/FOI laws: Serbia, Ukraine, Kosovo, Brazil, Uruguay, Jamaica, Nigeria, and so on. Within South Asia, Pakistan was the first country to adopt such legislation in the form of the federal Freedom of Information Ordinance 2002. Since then India has adopted the RTI Act 2005, Nepal in 2007, Bangladesh in 2009, and Sri Lanka in 2016 (Centre for Law and Democracy, 2018). The spread of RTI is not confined to countries and national governments. Many international organizations now have access to information policies, e.g., the World Bank and Asian Development Bank. The World Bank first adopted an access to information policy in 1994, and a new more robust policy came into effect in July 2010 – the Bank is now recognized as being one of the most open intergovernmental bodies. The International Right to Know Day began on September 28, 2002, when freedom of information organizations from around the world came together in Sofia, Bulgaria, and created the

FOI Advocates Network, a global coalition working together to promote the right of access to information for all people and the benefits of open, transparent, and accountable governments (UNESCO 2011). The members of the Network decided to commemorate this day as a way to share ideas, strategies, and success stories about the development of freedom of information laws and genuinely transparent governance in their own nations. In this backdrop, the entry intends to explore the usefulness and relevance of Freedom of Information Act in improving accountability and fighting corruption in developing countries.

## Freedom of Information, Accountability, and Corruption: Toward Better Governance

There are empirical studies investigating the links between RTI laws and governance indicators including corruption – yet, the results are mixed (Martini 2014). For instance, Islam (2006) finds that countries with information laws have lower corruption levels, and leading Romanian political scientist Mungiu-Pippidi (2013) shows that existence of Freedom of Information Act is positively associated with lower corruption and a positive effect of fighting corruption. Tandoc (2013) finds a positive correlation between control of corruption and years of implementation of RTI laws – the author argues that the older the RTI laws in a country, the more the country to have lower corruption levels. Some scholars demonstrate that stronger RTI laws lead to higher corruption conviction rates and disclosure of corrupt acts of government institutions (Cordis and Warren 2014).

The FOI seems to have a significant impact on improving governance process, and it brings information into the public domain and allows citizens to see what government is doing. It gives greater emphasize on transparency and accountability.

**FOI and accountability** – the public have the right to scrutinize the actions of those in public office and to engage in full and open debate about those actions. This requires information. Once citizens know what their government is doing, they are in a position to hold those in office accountable for their decisions and actions. The same applies for designated oversight bodies such as parliamentary committees: they need information to be able to fulfill their mandate. As the evidence shows, accountability in developing countries often remains weak (Narayan and Petesch 2002). Improving accountability among citizens, public officials, and their politicians is repeatedly seen as a greater challenge for a more responsive and effective governance in the Global South. When citizens are able to hold public officials accountable, it is more likely to affect service delivery including service quality (Besley and Ghatak 2003). Importantly, those effects may range from the reduction of perceived corruption (Deininger and Mpuga 2005) and local nepotism (Crook 2003), to greater access and better quality of basic service delivery (Caseley 2006), ultimately aiming at poverty reduction (World Bank 2003; Jilke 2013) and fostering state legitimacy (Brinkerhoff 2005). Thus, it is also argued that in the efforts of making public institutions accountable to citizens and fighting corruption, the Freedom of Information Act prevails useful as it helps brings out administrative malpractices and other forms of unethical acts of public officials to the light. In such instances, citizens can seek remedy by collecting necessary information from relevant public institutions (Jilke 2013). When citizens tend to hold public officials accountable through different forms of accountability initiatives such as participatory planning, participatory budgeting, participation in governance process, open government partnership, and right to information, it is more likely to put public pressure on officials and their day-to-day operation. Compared to conventional forms of engagement such as electoral voting, these direct forms of collective voice establish a visible connection between citizens' demands and official actions (Goetz and Jenkins 2005; Jilke 2013). This is especially important in environments where elections are regarded as ineffective in holding public agents to account.

Recent studies identify government transparency and access to information as preconditions to

upheld accountability to work (Bauhr et al. 2010). Once governmental information is made available, they claim, it reduces information asymmetries between government institutions and their respective citizens. Indeed, greater information about the process of government decision-making and the conduct of public officials increases citizens' capacity to hold their leaders into account. Citizens are thus empowered to engage in a citizen-government relationship where they judge public officials' political behaviour based on the information they have (Bovens 2007). According to Willems and Van Dooren (2012), once such a political forum has been established, a public official has an obligation to justify his or her conduct, and the public officials may face consequences, if they fail to do so. Yet, this does not necessarily mean that public officials will automatically become more accountable once information is made available, and it is important to keep in mind the rather harsh political climate in developing countries. However, access to information or put it differently free flow of information on the part of governance institutions accelerates the possibility of greater accountability. This in turn may have positive effects on citizens' views of their propensity to hold public officials accountable. A critical stage of the policy cycle within governments lies at the stage of decision-making. Thus, citizens can judge whether public officials' decision-making is responsive to their needs and demands. As such, providing access to information on the process of government decision-making is crucial for citizens' perceptions of local accountability. There have been cases where public officials and ministers have been expelled from public institutions owing to information disclosed through RTI requests, and such information demanded greater accountability and transparency in the governance which subsequently ended up with governance reforms, broader civil society mobilization against corruption, and so forth (Ansari 2008). Instances are recorded where citizens have tended to gather information on parliamentarians and leaked them – which led to identify wrongdoings and conviction and suspensions of members of the parliament (Dokeniya 2013; Alves and Heller 2013).

**Freedom of information and corruption**: secrecy and lack of information create a breeding ground for corruption and abuses of power. By promoting transparency and accountability, FOI curbs such abuses. It is not coincidental that countries perceived to have the most corrupt governments also have the lowest levels of development or that countries with access to information laws are also perceived to be the least corrupt (Persson et al. 2013). In 2002, of the ten countries scoring best in Transparency International's annual Corruption Perceptions Index, no fewer than eight had effective legislation enabling the public to see government files. Of the ten countries perceived to be the worst in terms of corruption, not even one had a functioning access to information regime (Commonwealth Human Rights Initiative website; Transparency International 2014). There is a broad consensus of the importance of right/freedom to information laws in enhancing transparency and accountability, thus reducing the opportunities for corruption. Nevertheless, empirical evidence of the impact of FOI laws remains scarce. In general, several studies have found that access to information is positively correlated to control of corruption, but the actual impact of FOI laws seems to depend on a series of other factors. As demonstrated by several studies, the RTI law alone can have a positive impact and help in the solution of specific cases, but it is unlikely to bring sustainable change if not effectively implemented and accompanied of other measures, such as guaranteed freedom of press and association, effective checks and balances mechanisms including the prosecution and dismissal of public officials found to be involved in corruption, and coherent policy responses to problems detected in service delivery (Martini 2014). In 1996 the then president of the World Bank, James D. Wolfensohn, declared that, for developing countries to achieve growth and poverty reduction, "we need to deal with the cancer of corruption" – the first time a World Bank president publicly declared corruption as a "cancer."

This indicates that we are living in a "culture of corruption" where corruption is the rule, not the exception – favoritism, cronyism, particularism, discriminations, unfairness, partiality, singling

out, indifferent treatment, and various forms bribes have become a normal way of life in many developing societies (Persson et al. 2013; Mungiu-Pippidi 2013). Since then matters such as corruption, anti-corruption measures, improving accountability, transparency, and freedom of information all became a matter of serious concern in developing countries. When there are effective legal measures to access information, it helps making those in office accountable for their actions and by giving citizens a voice; FOI helps ensure the former work for the benefit of the latter. It promotes better planning and service delivery, i.e., improved education facilities, social security, environment, poverty eradication, improved health care, and so on, leading ultimately to better human development outcomes (Ansari 2008; Mori 2013). Further, when citizens have access to information about service delivery and other government functions, they know what they are entitled to and they know how and where to demand their right to those services and other benefits. FOI thus empowers citizens to obtain their rights and entitlements. Importantly, this is a tool for citizen-centric governance, namely, citizens who understand public affairs and what government is doing can voice their opinion on issues that affect their lives. This is true not just for voting at election time but also for other mechanisms for citizen participation, e.g., expressing opinions in a policy debate and citizen oversight of services. In the policy process, it is not possible to provide useful input into this without access to the policy itself, as well as the background information policy-makers have relied upon to develop the policy. FOI facilitates citizens in making political and economic choices and participating in public affairs and thus strengthens democracy. Fighting corruption and improving accountability will be extremely difficult when there is no press freedom – the media are sometimes referred to as the "fourth pillar of the state." They have an important role to play in keeping citizens informed, keeping those in office "on their toes," highlighting issues of public interest, and so on. In order to be able to perform this role properly, the media need access to information. This is consistent with what Lindstedt and Naurin (2010) who argued that FOI laws have a positive impact in fighting corruption when accountability, media freedom, and free and fair elections are in place. Freedom of information is also closely connected with economic growth – by promoting transparency and reducing corruption, FOI creates a rule-based environment in which, for example, information about business opportunities is equally accessible to everyone, contracts are awarded in an open and transparent manner, and investor confidence is high (TI 2006).

The FOI regulates the proactive disclosure of information and the mechanism through which citizens can request information from public institutions, including the scope, exceptions, and refusals to access information. There is a broad consensus of the importance of FOI laws in enhancing transparency and accountability, thus reducing the opportunities for corruption. In general, several studies have found that access to information is positively correlated to control of corruption, but the actual impact of FOI laws seems to depend on a series of other factors. As demonstrated by several studies, the FOI law would not alone can have a positive impact and help in the solution of specific cases, but it is unlikely to bring sustainable change if not effectively implemented and accompanied of other measures, such as guaranteed freedom of press and association, effective checks and balances mechanisms including the prosecution and dismissal of public officials found to be involved in corruption, and coherent policy responses to problems detected in service delivery (Dokeniya 2013).

Countries with high quality of government institutions and low level of corruption show substantial improvements in social and economic aspects, in which FOI have played a substantial role. It is also evident that in developing countries the enactment of FOI laws is associated with rising levels of corruption – this may be due to the fact that the effectiveness of FOI Act appears to be conditioned by a country's institutional quality and arrangements to fight corruption which not only includes anti-corruption agencies but also other public and political institutions.

FOI legislation makes it mandatory for all government entities/departments covered to comply

with requirements to provide citizens with information – it removes the element of discretion. Moreover, it pushes public bodies to put in place the systems and personnel to provide information to citizens. Having a law also helps public bodies because it defines exactly what they have to disclose and what information is exempt. In relation to citizens, FOI legislation articulates the principle that providing information to citizens is not something done as a favor by government but as the citizens' right. It thus empowers citizens to demand information from public bodies. An FOI law will also spell out the procedure for accessing information and for making appeals and will include a list of the types of information that public bodies have to provide proactively, i.e., even without submission of FOI requests. All these provisions make it easier for citizens to access information, hold officials accountable, and disclose corrupt behavior and practices of government institutions and politicians.

As the evidence shows, enhancing accountability and fighting corruption rely on two important preconditions as follows.

**Political and bureaucratic will**: In many countries, the access to information laws merely remains a law without any substantial impact over citizens' lives and without a full commitment to transparency by the national government. To achieve full implementation of these laws, there has to be sufficient political will and leadership – evidence shows that countries have succeeded in implementing freedom of information and fighting corruption, largely through political commitment. In certain cases, administrative reforms may be a requirement to implement these laws which need political support and backing (Newman and Calland 2007). Politicians can themselves be part of the change in the culture of secrecy and improve their own credibility through their involvement with initiatives to promote and implement the right to access information. Several reforms have eventually became futile due to poor implementation along with lack of political and bureaucratic willingness – if reforms goes against the monopoly, discretionary power, and privileges of the public officials and politicians, they are unlikely to be implemented in developing societies. This shows the significance of broader institutional and political environment for curbing corruption and improving accountability in governance institutions (Dokeniya 2013). In other words, effectiveness of FOI laws appears to be conditioned by a country's institutional arrangements (Escalera et al. 2010).

**Culture of the right to information, accountability, and transparency**: A successful access to information law is one that works both on paper and in practice. To achieve this, creation of a culture of the right to information remains crucial. Such a transparent culture has two sides to it: the willingness of public officials to release information and the readiness of the public to file requests – this requires the proactive role on both demand and supply side of information (UNDP 2006). When public officials themselves become accountable and transparent, it is more likely to set precedence in the governance process toward open and people-centric governance, which in turn, will help change citizens perceptions and attitudes and behavior over public institutions and officials. It is pertinent to note that, in developing societies, culture of corruption, poor accountability, and transparency have not resulted only because of government institution and officials; it is partly because of citizen's attitudes and unethical behavior. Evidence shows that citizens in developing societies tend to bribe public officials to expedite the things, to avoid legal consequences and inquiries, to bypass established procedures and regulations, and to exempt from paying tax (Transparency International 2006, 2014; World Bank 2003). This explains on how citizens disregard their duties and responsibilities through bribing officials – this has now become part of culture in developing countries so that effective implementation of RTI/FOI acts and culture of information and accountability could help address this situation.

This also occurs partly because of the lack of public awareness of the access to information laws and of the right to request information from public bodies. Intensive legal education and freedom of information campaigns need to be undertaken to raise awareness among the population and stimulate filing of requests. A number of regional and international mechanisms have been established to monitor and support initiatives to combat corruption (UNDP 2006). Recognizing that transparency is a vital tool in the fight against corruption, many of these mechanisms include requirements that national governments take all necessary measures to promote access to information. A key treaty in this respect is the United Nations Convention Against Corruption (UNCAC) 16, which contains a number of references to access to information and points to specific steps that governments must take to promote transparency. It is hard to see meaningful initiatives on the part of state parties to implement the convention in developing societies despite having ratified the convention overwhelmingly. In addition to the above, a strong legal framework, overnighting institutions, effective appeal mechanism, proper regulation of RTI laws, adequate staffing, resources, record management, performance assessment, constant awareness raising at all levels, strong civil society, media, and effective checks and balances mechanism are crucial to gain potential benefits of RTI laws in developing countries.

## Conclusion

It is clear, even from this short essay, that in recent years there have been great strides forward in establishing a close link between the use of access to information laws and other work to combat corruption and improving accountability. There remains much to do to promote greater government accountability at different levels. As such, access to information laws need to be better implemented and more work has to be done to secure recognition of the right of access to information as a fundamental human right and to create a culture for the right to information, both within government and within society with the view to fighting corruption and improving accountability. Organizations working in the areas of both access to information and anti-corruption can forge strategic partnerships among themselves, with other CSOs, with public officials, and with intergovernmental bodies to push for greater transparency in the areas where it is most needed to root out corruption. A full range of activities is needed, including monitoring compliance with these laws, continuing of advocacy and awareness-raising campaigns, filing appeals, and engaging in litigation to defend the right to information. All these activities will promote recognition of access to information as a fundamental human right and will also strengthen its value as a tool in the fight against corruption and openness. In addition, cases of successful implementation of FOI laws requires a strong leadership and political will as well as the establishment of independent and well-resourced oversight institutions, a strong legal framework and appeal mechanisms on how to exercise their right to know for the purpose of creating a corruption-free society, and government and governance with improved accountability and transparency.

# Implementation of Public Policy, Brazil

Gabriela Spanghero Lotta
Getulio Vargas Foundation, Sao Paulo, Brazil

## Synonyms

Policy execution; Policy materialization

## Definitions

Policy implementation is the process of transforming policy rules, norms, and directions into practices that effectively produce public policies. In Brazil, policy implementation means executing policies and materializing them in a context of complex institutional arrangements, high diversities, and constraints of resources.

## Framework and Problems

Policy implementation analysis is an approach located in the broader policy analysis field. This

field proposes to see policies as a complex process composed by different stages: agenda setting, policy formulation, policy implementation, and evaluation. The policy cycle or stages model is a conceptualization of a complex process and not an empirical representation. "Stages are not insulated from each other and there may be a succession of feedback loops between them" (Hill and Varone 2017, p. 158). However, analyzing different stages help to understand specific agents or decisions that are made in each moment of policy process.

Policy implementation, or policy execution, is the moment after political decisions in which policies will be materialized or concretized. This moment depends on actions operated by different organizations, bureaucrats, and instruments. In the beginning of the agenda, researchers were influenced to analyze this phase trying to understand the differences between what was formulated and what was really delivered considering the big gap or the "missing link" between plans and outcomes (Hill and Varone 2017; Barrett 2004).

In four decades of research, the policy implementation agenda has already passed through different phases. The first one, named top-down, started during the 1970s and inaugurated the policy implementation analysis field. This approach carried a normative perspective about policy implementation. Authors made a clear distinction between policy formulation and implementation taking into account that the second depends on the first in a logic perspective. Implementation should also follow formulation in order to guarantee democracy and legitimacy in policy process: decisions should be made by those in policy formulation stage who have the mandate to make them. They should not be made by bureaucrats who were not elected and are only expected to execute what politicians decided. So, this first generation analyzes policy implementation starting from the top (policy objectives, plans, goals) in direction to down, in order to find where policies have been changed or where the process does not work as it was previously expected to. These analyses tend to find the gaps in order to correct them, guaranteeing the right and legitimate implementation in a prescriptive and normative logic (Pressman and Wildavsky 1973; Gunn 1978; Hood 1976).

As a reaction to this first phase, other authors proposed an alternative approach during the 1970s and 1980s, named bottom-up. They argue that policy implementation is not composed by mistakes or gaps. Implementation belongs to a complex process in which decisions do not end after policy formulation. Policy implementation demands continuous negotiation and adaptation, as plans are never able to predict every situation, and many agents will only be involved during implementation. Policies should, therefore, be analyzed from the bottom to the up, observing implementation as it is, describing and understanding the process as it really happens (Elmore 1979; Hjern and Porter 1981; Barrett 2004; Barrett and Fudge 1981).

During the 1980s the bottom-up approach was strengthened by studies that analyze agents responsible for policy implementation through interaction with policy clients – named as street-level bureaucrats (Lipsky 1980). Researches about these bureaucrats reinforce the idea that implementation is composed by decision-making, and bureaucrats are not pieces of a machine. They carry values and interests and they make policies (Lipsky 1980).

During the 1990s a new phase arises proposing alternative analysis approach that try to synthetize top-down and bottom-up perspectives and learning, as those proposed by Matland (1995) and Sabatier (1988) (Barrett 2004).

Nowadays we have the fourth generation of implementation studies. This generation proposes multiple approaches and is influenced by different fields, as sociology, public administration, and political sciences. This new generation also intends to analyze a more complex process, considering the changes in governments derived from New Public Management and Governance Models. For instance, this generation is incorporating issues such as coordination, policy instruments, interactive frameworks, multilevel and multi-layering, relations between state and non-state organizations in policy provision, etc. (Saetren 2014; Hupe and Hill 2007). The

current generation of policy implementation studies departs from some assumptions that were already proven in different studies.

The first one is the idea that policy formulation and implementation are not different stages. They should be seen as continuous decision processes that cross agents and organizations. Thus, as a second assumption, policy analyses have to consider a chain decision including different layers and levels, agents, organizations and instruments, and state and non-state units.

The third assumption is that implementation process is highly interactive. Many different agents are included in decision processes that lead to the materialization of policies. Policies are implemented by multi-organizational groups that interact defending different values and interests (Hjern and Porter 1993). These agents can be inside or outside organizations, they can be state or non-state agents, and they can be formally or informally included. Policy implementation analysis has to consider who these agents are, what they intend, and how they interact (Hill 2003; Lotta 2015).

The fourth assumption derives from the third: considering the multiplicity of agents and organizations, many different factors interfere and influence policy implementation. These factors concern to broader system characteristics (state's model, social beliefs and behaviors, national culture, etc.), organizational features (managing system, organizational culture, size and history of organization, etc.), and personal and relational characteristics related to individuals (personal profiles, trajectories, profession, personal values, etc.).

So, considering all of these specificities from policy implementation, its analysis aims to understand policies as they really are and not only how they should be. And the research agenda includes analysis from different empirical objects and methodologies.

Since its origin, part of policy implementation research intends to analyze the bureaucrats responsible for policy implementation. This research aims to analyze practices, interactions, behaviors, and decisions (Lipsky 1980; Tummers 2017; Brodkin 2012; Lotta 2015; Pires 2009). Another part of the literature aims to analyze which factors can explain the variation of bureaucrats' practices, interactions, and behaviors. They consider these elements as dependent variables and explain them through independent variables as organizational and institutional characteristics (Brodkin 2012), incentive systems (Tummers 2017), moral and social dimensions (Møller and Harrits 2013; Dubois 1999; Maynard-Moody and Musheno 2003), national systems (Moller and Hill 2018), technology (Buffat 2013), social networks (Lotta 2015), etc. Other researches aim to analyze the outcomes from these variations both for policies and for citizens. In these researches, the dependent variables are policy outcomes, and independent ones are practices, organizational features, interactions, behaviors, etc. Thus, they aim to understand how different actions can conduct to different outcomes. And the outcomes can be measured by policy goals (Brodkin 2012; Tummers 2017) or by access and inclusion/exclusion (Maynard-Moody and Musheno 2003).

All of these researches specify and analyze different objects that coexist in policy implementation: individuals, organizations, institutional arrangements, instruments, and interactions. They can also analyze street-level bureaucrats (Lipsky 1980, Brodkin 2012), middle-level bureaucrats (Cavalcante qne Lotta 2015), back office bureaucrats (Hoyler and Campos 2019), or interactions between bureaucrats (Dubois 1999).

## Studies in Policy Implementation in Brazil

As the decades of the literature have already proved, policy implementation is never a simple task. It always involves many different conditions and situations that cannot be anticipated, prevented, or controlled. It also involves many different agents, their interests and capacities, and the interactions they establish with each other. So, we could not expect that policy implementation in Brazil would be easier. However, we can also say that the Brazilian context creates some specificities into policy implementation that, somehow, make this process more particular than what the literature has demonstrated.

First, Brazil, differently from most of the countries studied before, is still building its welfare state, which was proposed only in the new Constitution of 1988, and it is still far from being concluded. Public organizations are still trying to provide universal policies that are, many times, delivered in places where the state has never been before. At the same time, the welfare state is being built in a context of resource scarcity and very high inequalities. The scarcity of resources is not only about the lack of money to provide policies but also about the lack of technical and bureaucratic capacities from local governments responsible for policy provision in many regions of the country. And high inequalities are experienced by groups who can only find solutions to their accumulated vulnerabilities through public policies.

Second, Brazil has very extreme geographical, demographic, and social characteristics. It is a country with continental proportions, with high geographic diversities (different climes, biomes, and geologies), with a population, and with high ethnic, racial, and religious diversities. It is also one of the most unequal countries in the world in terms of income and education, and it has groups with accumulated vulnerabilities. To provide rights to citizens in this big and heterogeneous context, Brazil had to improve their public equipment and bureaucracy, there are around 150,000 public schools, almost two million teachers, 42,000 primary care health clinics, 700,000 health professionals in primary health care, more than 8,000 social care services, and more than 450,000 police officers (data from 2017). And this is not yet enough. All of these data demonstrate how Brazil requires high capacities of coordination for policy implementation.

So, being successful in policy implementation becomes, at the same time, a mandatory and challenging issue. It is mandatory because Brazilian citizens need universal and high-quality policies, and the government has lack of resources to implement them (they need, therefore, to make good decisions). It is a challenge because the context is very complex for policy implementation, and it creates obstacles for its effectiveness. These are challenges both for managers and implementers and for policy analysts.

## Characteristics and Challenges of Policy Implementation in Brazil

Considering Brazilian characteristics, here were selected some important specificities that help to understand Brazilian challenges for policy implementation, both empirical and theoretical.

The first particularity is about the challenges imposed by the Brazilian Federative arrangement that combines autonomy and independence of federative unities in a context of high heterogeneities and inequalities. Brazil has three federative levels: federal government, state government (27), and municipalities (5570). All of them have political, financial, and administrative autonomy. However, policies, which are designed to guarantee universal rights, have to be provided by the units in regimes of cooperation or competition.

Federative units have to coordinate policy provision and, at the same time, adapt them to very local conditions. This requires a multi-layering model of implementation. Recent federative dynamics tend to centralize policy formulation, regulation, and funding and decentralize policy implementation (Arretche 2012; Oliveira and Lotta 2014; Santos Nunes 2017). This means that universal rights have to be provided in very diverse contexts, and policies have to be adapted locally in order to fit local features and needs. This also implies that policy design has to be generic enough in order to be adaptable and implies high capacities for coordinating different agents, services, and policies.

Researches have demonstrated the particularities of the Brazilian federalism in different policies and its consequences in policy provision and inequalities reduction (Arretche 2012; Menicucci and Marques 2016; Lima and D'Ascenzi 2017; Souza 2017; Bichir et al. 2017). They show how different solutions can be more or less adaptable into local diversities and, as a consequence, can improve or not social inclusion. This is a scenario where policy implementation tends to be naturally a moment of policy transformation and adaptation. Local actors have to be provided with capacities to diagnose and analyze local characteristics and demand and to negotiate policy adaptation to local context. Thus, the Brazilian federalism

imposes great gaps to local implementation and demands from local actors' very specific abilities for formulation, negotiation, and implementation. It also imposes to policy researchers' abilities to understand implementation as a moment of redesigning and analyzing different contexts as they really are: places where the same policies can reach very different concrete designs.

The second characteristic of Brazilian context that is important to understand policy implementation is the involvement of social actors in policy process. Since the federal constitution (1988), Brazil has improved the participation of social actors in policy decisions, mainly creating participative institutions. Nevertheless, since the 1990s, Brazil has also improved the involvement of non-state actors in policy provision. Non-governmental organizations (NGOs) have been hired to provide policies in areas as health, social care, and culture, for example. Usually, they implement the same policy that can be provided directly by state organizations. This means that the same policy can be implemented both by government and NGOs in the same territory. This generates different consequences for policy implementation.

First of all, governments are not only responsible for directly providing the policy. They have to be, at the same time, responsible for contracting, regulating and evaluating another organization that is responsible for providing it. As a consequence, this demands specific and different capacities from government in the implementation process. Second, policies that are aimed to guarantee a universal right can be implemented by very different organizations (state and non-state), which have their own interest, features, and decision processes. It imposes one more complexity in policy implementation. Third, organizations that implement policies are subject to specific patterns of accountability and participation. How can the government impose the same patterns to organizations that are not governmental? Finally, this is also a challenge for policy analysis: how can researchers compare equal policies provided by different kinds of organizations? How can they name different agents responsible for policy implementation? Are they all street-level bureaucrats even if they don't belong to a state organization?

The third characteristic of the Brazilian policy implementation concerns to accountability and social participation in decision processes. Since the Constitution of 1988, Brazil has experimented many different participative institutions. For instance, the participative budget, participative planning, conferences, hearings, and policy committees are usually mandatory instrumentos in policy decisions. Nonetheless, most of them only operate during processes of agenda, formulation, or evaluation. We have some institutions that operate more directly during policy implementation, as the committees connected to hospitals and schools, for example.

Anyway, there is a lack of participative decisions during policy implementation. What teachers do inside classes, what nurses do inside the clinics, or what police officers do in their cars is not clear for managers. Of course this is a classic problem of policy implementation, and since Lipsky (1980) authors have been dealing with the challenge of how to make street-level bureaucrats more accountable. However, Brazil has experienced many advances in participation and accountability that did not reach yet the moment of policy implementation. For researchers this is also an interesting agenda: analyze how local participative institutions operate and how street-level bureaucrats and organizations are controlled and if they are more or less accountable in different contexts.

Finally, another important issue for the Brazilian policy implementation is about cross-sectorial policies. Integrate policies to provide effective solutions are a way to cut resources and improve policy provision. Considering all the challenges imposed by diversity, heterogeneity, federative system, and lack of local capabilities, cross-sectorial policies can provide complex and integrated solutions to existing problems (Bichir 2011; Bronzo 2010; Lotta e Vaz 2015; Lotta e Favareto 2016). Brazil has only now started experiencing some integrated policies, but they are still very restricted to some areas and some organizations. These experiences have to be

analyzed, and the lessons should be learned to be expanded to other areas and governments.

## Conclusion: Brief

Policy implementation research has advanced in the last decades and has already developed an important agenda with many outcomes and assumptions. This agenda contributes both to the literature and to policy managers to propose better policy design and managing.

In Brazil, this agenda is still very new and has to be improved incorporating the specificities of the Brazilian context (Pires et al. 2018). This can lead to better researches and the improvement of a Brazilian policy implementation research agenda. However, even more important, these researches and the incorporation of Brazilian specificities are important for policy implementation. In a country with high indexes of vulnerabilities and high inequalities, where there are still difficulties for implementing universal and effective policies, it is very important to give attention and to prioritize policy implementation. Well-implemented policies are central to guarantee better impacts for citizens and legitimacy for government.

# Implementing Technology Policy as Higher Educational Teaching and Learning Tools

A. Vyas
Department of Mechanical Engineering, The Hong Kong Polytechnic University, Hong Kong, China

## Synonyms

E-learning; Higher education; Technological challenges; Technology policy

## Introduction

With the rapid development of technology in recent decades, it is a widely held view that the role of technology in the process of teaching and learning has become more and more crucial in higher education in Hong Kong. In 2001, UGC launched a review on higher education in Hong Kong and reported that technology is challenging us to acquire new skills to harness its powerful but demanding potential to enhance teaching and learning (Tung 1997). The need for staff in the sector to develop new skills to respond effectively to technological and other changes in higher education was also recommended. Therefore, the expectation of technology being adopted in higher education at all scales is very high realizing the demand in current situation as well as for future workforce (Blake 2013). Today, there are developed policies adopted in most higher education institutions having different terminologies but with common objectives regarding the use of electronic devices. The aim of these adopted policies has spectrum scaling from the use of information technology such as the Internet, online communications, laptops, smartphones, and institutional computers to social media such as Facebook, Twitter, or any other forum recommended by institutes (Kelly 2004; Mason and Rennie 2006; Jorge 2006; Kirkup and Kirkwood 2007). However, there are potential issues with educators utilizing a variety of electronic means and their implications of technology policy and its use (Becker 2013). In this chapter, the author reviews and reflects the significance and advancement in e-learning technologies and puts forward broader implications of technology policies and converses the educational technology opportunities. Also, reflections on the associated challenges in realizing opportunities that could impact teaching and learning in higher education

are discussed based on authors' accumulated years of experience in engineering education.

## Technology Policy and Its Barriers for Implementation

There are variations in the institutional structures, and the use of technology in these institutions can differ due to variation in various contexts such as their geographical location, disciplines, subjects, and class sizes, thus making it difficult for educators to formulate a policy that would fit all scenarios and contexts. It is individually in educator's hands whether or to what extent they want to use technology or electronic device in their teaching and thus cannot conform to a general institutional policy (Tindell and Bohlander 2012; de Freitas and Oliver 2006). Therefore, non-compliance to institutional policy due to reasons above leads to questions of its objectives.

In view of the adaptation of technology policy in higher education, it is important to show the birth of e-learning technology. Thus the significance and environment along with tools of e-learning are discussed here first. Later, the details of various technological scenarios and the use of diverse common technologies in engineering along with the associated challenges are also discussed.

## Why Is E-Learning Important in Higher Education System?

Today, information communication technology (ICT) has become a core system that manages peoples' wealth of information and knowledge. It has become the backbone of our education system, work place culture, and enterprises and has literally changed our way of living, communicating, learning, and entertainments (Kozma 2003; Hmelo Silver and Bromme 2007). ICT has become a popular platform as it provides electronic services to all sectors of work and education (Chiu 2005). It is also seen that progress in information technology and advancement in science and education create possibilities to generate e-learning environments (Khan 2005).

The necessity of engaging e-learning in higher education and its impact can be acknowledged only after we have understood the imperative needs and importance of applying e-learning in nowadays higher education system.

## Background of E-Learning Environment in Higher Education

### Birth of Systematic Learning Technologies

The birth of learning technology happened first in the 1900s, by introducing the film permitting the use of slides in classroom, in the future followed by invention of TV and radio that created the possibility of an asynchronous technology in the education system. Asynchronous methods affect the learning experience and make it more effective in a way that participants don't need to be online at the same time. Later on, in 2000s, the introduction of the Internet gave a new method of delivery in education termed as a synchronous technology where students are not required to gather in a classroom to get access to information (Garrison et al. 2004), instead, a mode of delivery where participants access coursework materials on their own schedule or present at the same time despite the participants located remotely. Later, the development of the Internet and application of Wi-Fi networks enabled the "web-based e-learning." The evolution of e-learning tools – the three major Internet generations – WEB 1.0, WEB 2.0, and WEB 3D, and mobile technologies that are now well embraced can be understood sequentially (Wang 2007; Pelet 2014).

### World Wide Web (WEB)

First generation, WEB 1.0, was introduced in 1991, characterized by a convergence of new computerized and networked technologies which enhanced the teaching and learning experience, giving choice to users with capabilities to opt for synchronized and asynchronized forms of interaction without any constraints. Multimedia as one of the new technologies and support browsers helped

us to organize and express the content in a new way such as animation and graphics.

Second-generation WEB 2.0 was introduced in 2004. It is more individualized, and the content can be created by public individuals instead of institutions, for example, the WiKi. Basically, mass interactive replaces mass communication, blogs, YouTube, and other social networks, all belong to this generation.

Third-generation WEB 3D introduced the 3D virtual worlds which enables e-learning with simulate virtual activities, such as operating theaters, production lines, etc. and used by many educational institutions for creating teaching and learning environments.

### Mobile Technology

Mobile technology is mostly used in cellular communication and many more applications including higher education enriching teaching and learning experience to new heights with a possibility of student participation in an online course and being able to access notes directly on their mobiles. This technology has changed education in more fundamental ways than just providing a new gadget that delivers information.

With the evolution in e-learning, new standards have been set for the role of a teacher demanding higher requirements of additional teaching skills and capabilities. Blended or integrated learning is being widely practiced in nearly all higher education institutions (Giesecke 2002). NACOL (North American Council for Online Learning) defined that "Blended learning should be viewed as a pedagogical approach that combines the effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment." E-learning enables full-scale diverse nature of communications such as email, discussion boards, online tutorial, supervision, feedback, and technical support services.

## Summarization of Progress in Technological Capability

Based on the general progress in technological capability, some of the opportunities that are now available in engineering education (Firoz 2014) are equipped with:

1. *Malleable Delivery*: Example – learn via video lectures, by reading texts, or by experimenting with simulations
2. *Upgraded Potential*: Example – annotation for pdf documents and media annotation tools for video/other media
3. *Interactive Engagement*: Example – engaging feedback processes to eliminate face-to-face dependency contact where location and time is an essential constraint
4. *Asynchronous Deployment*: Example – through the use of discussion boards, recorded lectures, and videos for laboratory preparation
5. *Courseware*: Example – via e-portfolio for collaboration between industry and students, a work-integrated education
6. *Onshore/Offshore Delivery*: Compliance of course materials delivered irrespective of location (onshore/offshore)

## Common Educational Technologies in Higher Engineering Education

A wide variety of educational technologies are available for providers of engineering education. Most common ones are mentioned in the following sections.

### Video

Presentation of information in the form of a recorded lecture and its use in education is possible due to the well-established technological capabilities. There are plenty of recorded lectures available and accessible via the Internet and other platforms. Out of these, there are many recordings from famous or very experienced professionals or professors from across the disciplines and across various sectors. The recorded lectures are commonly used in many universities. It is well noted that, when mentioning as a case in engineering, most lectures do not contain detailed concepts, such as safety standards or units used or even their suitable conversions. More so, in the context of content, the latest suitable development of the topics is also missing putting credibility at

stake. The impact of recorded lectures has penetrated in teaching and learning culture (Cummings 2012). It is true that these recordings do give students leverage from the need to travel to their university or even when they miss the lecture recordings, and there is a real back support. But their reliability for many reasons can be critical to students' experience. When the length of the videos as controversially argued is not in question, students' concentration however can be easily derailed if the content of the recorded lecture is not engaging. More so, in some cases, learning via classroom interaction when prompt raising of a question from a student occurs is lost. Short sequential videos on a topic can be fruitful. In addition, virtual reality tours/video episodes are also a very powerful tool that can be very well used to show concepts that may be otherwise be unavailable to students. Academics and professionals from various specialized fields or industries can inform students or learners about certain concepts of, for example, functioning of complex machines, mechanics of different structures, and so on. Such tools can help the learner to revisit and browse for important moments as and when the need arises.

### Simulations and Animations

Experiments in the laboratory environment give the students hands-on experience, understanding of the equipment, and get a sense of connecting to the machines and their operations. However, the accessibility of laboratories and equipment for various reasons does exist. Simulations mimic the experiments, and learning through it integrates the behavioral and technical skills into an environment where learners believe the setting is real. Simulations not only act as an additional tool to explain the machines but also allow the students to revisit the concepts of complex systems whenever required. It can represent the systems in several ways such as, in a scratch test, when a progressive load is applied on a surface of some component, the friction and the failure in terms of wear on the surface can be generated allowing it to show real-time responses. However, the time consumption to produce an effective simulation is comparatively large, and to make it work in different experimental situations can be a problem. There are simulations and animations available online on various topics which may be effectively incorporated in say engineering program, but their availability in the long run is not guaranteed. Simulation and animation should be considered as part of the pedagogical approach as it's a very effective learning method.

### Text Annotation

Annotation and markup have become important tools for information communication, retrieval, and management (Lian and Shaofeng 2010). Many educational institutes have opted for e-books which are readily available to the readers through the services provided by their organizations' libraries, as a consequence, leading to less use of printed material texts which was a sole conventional resource earlier. E-materials are easily accessible by the users in their personal gadgets such as mobile phones, laptops, iPads, etc. Students can annotate their printed materials such as giving comments, explanations, or even drawings. With the availability of annotation tools, for example, in Adobe Professional, the user gets control to alter, generate their own versions of e-materials such as underlining the important terms, write important words and their definitions, mark definitions and their meanings, mark where important information can be found with keywords and symbols, and add phrases. It also benefits the students to improve their skills. The annotator has the liberty to retain his copy and his annotations either private or his annotations can also be shared.

### Collaboration Tools

Collaboration between academics and students on- and off-campus is a traditional component of teaching and learning (Fatma and Nesrin 2015). It is convenient for the students to make appointments and attend to their difficulties in their work through discussions and find ways to overcome them. Several times, the meetings between both the academic and student cannot take place due to reasons where either or both of them may not have suitable time or place to meet. A convenient method to mitigate collaborative difficulties is to use online discussion boards. Students post questions which can be responded asynchronously. As

students work and learn together, therefore they are strongly encouraged to comment to any query that is posted, thus building strong collaborative networks within the class. In this way, being heard can give the feeling of importance and value to the students. This can minimize the academic need to respond to every posted question. It can also help shy students express themselves more. More so, there is no monitoring required by the academic to conscientiously keep track of discussion board just to make certain that no incorrect views or opinions are being shared or any other inappropriate activities are taking place. The performance of the students is certainly enhanced in an environment where a blend of classroom and online technologies is employed. However, it is known that unless the academic has a clear purpose for the discussion board, it is unlikely that a student will use it. In addition, sometimes, the student participation depends on the topic of discussion, and their contribution to quality discussion and the depth of learning can be compromised due to the nature of content; thus, it can be further improved by imparting better argumentation and integrative skills to students.

### E-Quizzing Tools

Assessment in education by employing web tool which is also known as e-assessment deals with the effective use of technology to support successful instruction. E-quizzing tool suited as a virtual learning environment and used for a formative assessment. One of the ways to use e-quizzing tools, for example, in a classroom, as a diagnostic assessment, the assessor can promptly receive student's current level of understanding before moving on to next topic or online quizzing can be used as a formal assessment or used as a self-assessment. It can also help provide information via feedback on the basis of which, if needed, necessary modifications can be made in order to improve teaching and learning. The online quizzes can be assessed automatically, giving the students rapid responses to their submission and relieving the academic staff of some of the labor of evaluating responses. It also helps enhance greater interaction between the teachers and their students.

### ePortfolios

ePortfolio enables students to create, manage, and share web-accessed electronic portfolios that document their knowledge, skills, and achievements from coursework and from extracurricular activities. For example, students from a course on introduction to engineering excel in their work and are proud of their design projects and consider it as worthwhile to post not only the final report but also consider posting photos and video of both the design process in action and the final product in their ePortfolios. These can be used to integrate feedback from concerned people such as academics or industry collaborators. Proper implementation of an ePortfolio is possible when academics are familiar with the objective and mechanism of using an ePortfolio. Feedback from external on internal reviewers can authenticate the material. Students should know how to authorize industry collaborators to review their portfolio. Using an ePortfolio can aid in their learning process (Kolb's 1984).

## The Challenges

There are several common challenges associated with the abovementioned opportunities. However, it should be the institutional priority to address the issues and challenges in order to achieve maximum benefits of the educational technologies. The common challenges center around:

1. Lack of adequate ongoing professional development for facilitators to be able to integrate appropriately the new technologies for teaching and learning.
2. Delivering teaching material via any new educational technology is misleading thus compromising teaching pedagogy.
3. Simulated environments as a replacement for "real" environments may offer only part of the "real" compromising important concepts misleading the true complexity.
4. For reasons, when network failures take place, the educational technology is compromised as backup strategies are not there.
5. Sometimes the applications of educational technology face an obstacle due to local logistical

problems associated with the upgradation of softwares, browsers, system speed, operating systems, sound cards, etc. compromising the effective teaching and learning environment.

## Conclusion

The reflections and reviews on implementation of technology policy are expressed as a discourse in this chapter which represent the experiences of the author in engineering education covering educational technology opportunities in higher education. With regard to technology policy, there is a need for both academics and students to enlighten themselves regarding the use of technology in higher education, and institutional policymakers could consider this in relation to their institutional priorities. Compatibility and experience of users and computer technologies are the key determinants of whether or to what extent the educational technologies can be properly exploited for instructional needs. In this relation, it also takes into account the common challenges confronted in implementing new educational technologies for teaching and learning that may obstruct the proper adoption of technologies and instead may negate technological opportunities if not met with adequate support.

# Implication Study Methodology for Public Administration and Public Policy

Hassan Danaeefard
Faculty of Management, Tarbiat Modares University, Tehran, Iran

## Synonyms

Implication research; Implication study

## Definition

A study in which a public administration and public policy researcher studies a problem that requires analysis of the implications of a philosophy, theory, model, or idea for his or her field, field of study, or topic of interest; relies on the text of a philosophy, theory, model, or idea as a source of knowledge production; asks specific as well as broad questions; has the resulting data that is mostly extracted in the form of words (or propositions) from the texts; analyzes texts to enumerate contributions and implications from the origin of implications (a philosophy, theory, model, or idea); and conducts study in a subjective and reflexive manner.

## Introduction

This entry introduces a new label, "implication eliciting methodology," and grounds it within the debates on unobtrusive methodologies. Generally, "implication refers to the conclusion that can be drawn from something although it is not explicitly stated." There are various methodologies for conducting many kinds of research: for example, to examine the impact of on-the-job training on the productivity of human resources in public organizations, we require an experimental research methodology; to investigate the correlation between policy research and quality of public policy, we call for correlation studies; and to understand the culture of a group, an organization, or a society, we use ethnographic research. We can also construct a theory of employees' indifference in a public organization by a grounded theory design. To understand the essence of the experiences of citizens, we use a phenomenology strategy. The question is: *Which methodology will you adopt to research the "consequences of," "influences of," "applications of," or "implications of" a philosophy, a framework, a theory, a model, or an idea for public administration and public policy?* If you ask what your methodology is to study the "implications of critical realism philosophy" for *public administration and public policy*, what would your answer be? There is a shortfall of methodology to answer the question. The author has coined such studies "implication eliciting studies" and marked their methodology as "implication eliciting methodology." Given the interdisciplinary nature of *public administration and public policy*, this methodology can play an essential role in producing knowledge underlying those areas. This entry aims to introduce the methodology and discuss its significance, necessity, steps of conducting it in practice, and its evaluation quality.

## Theoretical Foundations of "Implication Studies"

The scientific community's objective of public administration and public policy fields is to articulate, improve, and expand public sector knowledge. The produced knowledge can generally be categorized into two general categories, positive and normative sciences, although there are some narrower categories. In general, a positive theory attempts to explain how the public administration and public policy work in a value-free way, while a normative theory provides a value-based view about what the public and public policy ought to be like or how it ought to work; positive theories express *what is*, while normative theories describe *what ought to be* (Velasquez 2018, p. 2500). The first category refers to the produced knowledge about *what is*. The outcomes of such scholarships are articulating, understanding, exploring, and explaining the function of an experimental phenomenon. Scholars in all paradigms (positivism, interpretivism, realism, pragmatism, complexity, and chaos) study "what is." Instead, the second category (for instance, critical theory) points to the knowledge produced about "what should be."

Although all paradigms are based on their methods to build positive and normative knowledge about their phenomenon of interest, there are different ways to produce disciplinary and interdisciplinary knowledge. Therefore, scientific communities deploy various strategies to create such knowledge. The academic disciplines, including public administration and public policy that have their domain (Becher 1994) and

different cultures (Lee 2007), study different subjects (Grieb 1974). Still, there are several ways for disciplines to interact with each other (Davis 2007) and gain insights from each other. So far, focusing on interdisciplinary knowledge (Pyenson 1997) has been the best way for disciplines to interact. Still, implication studies enable public administration and public policy to use insights into the knowledge of far and near disciplines to acquire their discipline knowledge. Therefore, the popular strategy is to borrow and derive from a study field to articulate, improve, or expand another study field. Borrowing is a general theory of practice among academic disciplines (Fellows and Liu 2020). Therefore, the knowledge exchange is mostly seen in inhomogeneous fields and sometimes heterogeneous ones. For instance, public and public policy comprise different disciplines (politics, economics, management, sociology, history, etc.). The homogenous disciplines of social sciences or natural sciences use the ideas of family fields. Heterogeneous fields of natural sciences and social sciences use each other as well. In this way, different disciplines can play a role in public and public policy growth.

Given that, all fields, including public administration, borrow concepts and theories from other areas in a way or so. Similarly, the public administration and public policy use ideas from fundamental fields such as psychology and sociology on the one hand and fundamental philosophies such as positivism, interpretivism, critical theory, postmodernism, chaos, complexity, and critical realism. In some fields, such borrowings are so popular that they balance their theoretical shortfalls by fundamental areas (like different philosophies). Such practice sometimes needs "horizontal borrowing," in which the scholars of public and public policy use concepts developed for studying other phenomena (Whetten et al. 2009).

The important question is: How to borrow insights from other areas with a vertical or horizontal position relative to ours? The source of such uses may be written or verbal works of the scholars of a field. They are the schools, philosophies, paradigms, theories, models, techniques, and scattered ideas that may be adopted. Although some disciplines are the main feeders of others, philosophical ideas or philosophical traditions are vast sources of impact on all disciplines (either social, natural, or art). Still, family fields may also learn from each other. The worth of any scientific work (philosophy, theory, model, idea) is in its hidden philosophical element (Agamben 2009). The philosophical element points to the inner potential of work, making it potent for expansion and development.

## Types of Implication Eliciting Studies in Public Administration and Public Policy

We can distinguish two dominant designs of implication eliciting studies: the systematic procedure and the emerging design.

### Systematic Implication Eliciting Research Design

In this research design, the researcher first devises a conceptual framework of a topic and seeks implications for each component from a discipline, philosophy, framework, theory, model, or ideas. For instance, the researcher places the policymaking cycle (e.g., Dye 1998) comprising (1) identification of problem, (2) agenda setting, (3) policy formulation, (4) policy implementation, (5) policy evaluation, (6) policy change, and (7) policy terminations as a basis for his or her implication study of complexity science for policymaking study. In this case, there must be a correspondence between contributions (critical points of complexity science) of complexity theory and implications of each contribution for each component of the policymaking cycle. Most implication studies focus on this approach, but there is an emerging approach in some cases.

### Emerging Implication Eliciting Research Design

In this research project, the researcher raises a general question to determine what ideas a particular philosophy, theory, or model has for its field of study. For example, what guidelines or implications does critical realism have for general

policymaking? After studying, it becomes clear that critical realism has implications for the process of policymaking, analysis of public policies, and evaluation of public policies.

## The Steps of Implication Eliciting Study Methodology

The methodology is the process of conducting research (Creswell 2015), and the method is the tools used for different steps of methodology. In other words, the method is simply a research instrument. The methodology is the justification for using a particular research method. The term "methodology" is used for implication studies as different methods may be used for different phases of such studies. The methodology of implication research can justify using specific methods in the stages as a theoretical framework. Although it is essential to follow some research steps, the process is not carried out in the nonlinear irreversible form in practice. Still, there are backward and forward movements between steps to accomplish a more reliable and valid outcome. Implication eliciting studies pass through phases, but those steps are not linear in general, and there is a frequent trade-off.

### Determine the Suitability of Implication Eliciting Study

"Implication research methodology" is suitable for studies where you decide to elicit primary guidelines for your research area or field of study from contributions of a general or sometimes specific field, a school, a philosophy, a framework, a theory, a model, or an idea. Therefore, this methodology does not seek experimental research (exploring, explanation, and understanding) because its objective is eliciting implications. It, therefore, seems suitable where the researcher is looking for borrowed knowledge. The "implication eliciting methodology" is applicable for researchers capable of cognitive organizing and eliciting ideas from other fields to use in their specialty. These people have a good mastery of the origin field (philosophy, framework, theory, or model) because eliciting critical ideas from other areas to be adapted is too difficult for novice researchers. To achieve success in this methodology, the researcher should master qualitative research methodology, in particular quantitative research.

### Determining the Source of Eliciting Implications

Generally, there is an exporting and an importing source of ideas in "implication eliciting research." For instance, public administration and public policy is an importer of sociological concepts to its research domain. The public administration and public policymaking (importer) seek guidance from critical realism (exporter) to boost its knowledge.

### Defining a Process for Extracting Implications

As the purpose of "implication eliciting research" is to devise the implications of key ideas from philosophy, a framework, a theory, or a model for the applicant's field, it is necessary to identify and determine an ad hoc primary process for "implication research." The process may change during the research, but the researcher needs a procedural outlook. The process must originate naturally from the research problem and questions to validate the implications.

### Determining a Conceptual Framework for the Destination of Application of Implications

The first question that arises for the implication researcher is what topics the implications are focused on. In other words, what do you mean when it is said that the researcher wants to draw the implications of critical realism for the public administration and public policy?

In such a case, the researcher has two choices to choose from:

1. **Systematic approach**: The researcher articulates a conceptual framework for borrowing ideas from the lender and elicits appropriate implications for each of the conceptual research components. Going back to the example of critical realism's implications, the researcher selects the policymaking cycle (identification of a problem, agenda-setting,

policy formulation, policy implementation, policy evaluation, policy change, and policy termination) and asks critical realism about implications for each of the components.

2. **Emerging approach**: The approach allows the lender to shape the implications of a discussion topic without a predefined conceptual framework. In other words, the implications address the subject and its components on an emerging basis. Therefore, different implicative propositions may be elicited, not necessarily based on the predefined conceptual framework.

### Choosing a Theoretical Sampling of the Source of Taking Implications

The critical point in collecting data for "implication eliciting methodology" is focusing on data enabling you to shape quested implications. Although "implication eliciting researchers" and theorists may use different types of data (interview, text analysis, etc.), many researchers rely on written texts in the best possible manner to elicit implications. A characteristic of "implication eliciting research" is that the researcher embarks on collecting data more than once because he returns to his/her data source to collect richer and more data. Therefore, the process does not have a precise timeline, and the researcher continues to collect data until the implications are sufficiently comprehensive. The sampling of texts is theoretical. Therefore, he/she selects a text or interview to help theorize the intended implications. Thus, theoretical sampling is, knowingly or unknowingly, used in "implication eliciting researches."

### Eliciting the Contribution of the Source of Taking Implications

The key question in "implication eliciting research" is the implications of this philosophy, framework, theory, model, or old or novel ideal for public administration and public policy. In this line, the researcher may study firsthand resources and ultimately elicit a conceptual framework from critical realism ideas. The final point is that the elicited contributions may be uttered through propositions or expressions. The researcher must define the primary or secondary source of such contributions in one or several paragraphs to elicit his intended implication in its light.

### Validating the Contributions of the Source of Implication

The validity of contributions is linked to the scholar's scientific credibility, and the scientific community will judge the contribution over time. Undoubtedly, the number of citations made to the contribution in different works confirms the contribution's validity. A scholar's contribution indicates his/her credibility, and its essential credibility relies on the reasons behind that contribution. A practitioner or a researcher wishing to select a systematic approach for selecting contributions may follow another path.

### Fitting Contributions of the Source of Taking Implications and Conceptual Framework of the Destination of Application of an Implication

Now that the elicitations' contributions are clear, if the researcher has determined a conceptual framework from receiving source, correspondence should be made between them. The researcher may draw a table and illustrate the connections.

In this style, the systematic approach is suitable. And the framework of contributions is compared to the conceptual framework. Sometimes, an emerging approach is adopted. There is no predefined conceptual framework here. The researchers allow data to show their emerging implications. There may be a predefined conceptual framework in this case, but the elicited implications may not cover the overall conceptual framework.

### Eliciting Intended Implications

The researcher writes down the implications at this stage. The implications may be elicited in two states. The first time original implications and the previous implications expanded by the researcher. The former indicates an implication research, which is conducted for the first time on a given topic. All elicited implications are innovative, but there may have been rare cases of implication research on a topic. Having said all

this, the core of "implications eliciting research" is embedded in this phase because previous steps provide the ground for this step.

### Validation of Elicited Implications

The validity of elicited implications for essays sent to academic journals will be determined by peer review. On the one hand, the logic of implications and their citation power may be decisive in determining their validity. Therefore, the researcher can evaluate the level of agreement or disagreement of the experts in the field of study by compiling a questionnaire consisting of the contributions (critical points) and their elicited implications and the reasons for their opposition. The researcher can report the experts' contributions and explanations in the form of a table or narrative propositions and ask them to express their general opinion. Meanwhile, any researcher criticizes the implications based on his assumption based on Weick's (1989) tradition and tries to present plausible and justifiable implications.

### Reporting the Research Report

Research chapters of implication study can be listed in this manner:

1. Chapter I: Introduction
   - Introduction
   - Problem statement
   - Primary research methodology
2. Chapter II: Literature Review
   - Descriptive review of research literature
3. Chapter III: Research Methodology
   - The process of conducting research
4. Chapter IV: Analysis of Research Data
   - Contributions
   - Implications
5. Chapter V: Discussion and Conclusion
   - General findings of the research
   - Explanation of findings
   - limitations
   - Future researches

## Conclusion

We claim that many public administration and public policy studies gain insights from the philosophies, theories, models, and ideas of other disciplines and fields. These insights can be the source of expanding knowledge in various areas of public administration and public policy. Many of these insights have become rich books in the field of public administration (e.g., Ongaro 2020) and public policy (e.g., Morcol 2012). Although the methodology of obtaining implications by the authors of these works is not transparent, all of them have implication research characteristics. On the other hand, implication studies are the beginning of research on new topics (philosophies, theories, and ideas) that scholars and researchers seek to bring into management. Accordingly, works whose essence is implication research are the basis of empirical research in public administration and public policy.

# Implicit Leadership Theories

Birgit Schyns[1] and Ronald E. Riggio[2]
[1]Durham University, Durham, UK
[2]Claremont McKenna College, Claremont, CA, USA

## Synonyms

Leader Image; Leader Prototype

While leadership is often seen as what leaders do, more recent work in this area acknowledges that leadership is a process of interaction between different actors (i.e., leaders and followers) and the environment. This notion of a process of interaction leads straight to the question of what shapes this interaction. Why do leaders behave the way they do? Why do followers react the way they do?

One way of looking into this question is to turn to implicit leadership theories. Implicit leadership theories (ILTs) are everyday theories that individuals hold about leaders in general (or ideal leaders). They are mental representations of leaders and influence how an individual acts toward leaders or as leaders based on these cognitive representations. These cognitive representations are similar to stereotypes, in that they are stored in memory and will be activated when the person meets an individual whose characteristics and behavior matches their implicit representations of a "leader." (Kenney et al. 1996) Leaders act in ways that they believe are consistent with their cognitively constructed leadership role. At the same time, implicit leadership theories shape the expectations and reactions of followers toward leaders.

Implicit leadership theories develop early in life (Ayman-Nolley and Ayman 2005), and are relatively stable, although they may change and be modified with experiences. Parents, as the earliest "leadership" figures that most children encounter, likely play a big part in the formation of ILTs. Some recent research suggests that implicit leadership theories of a prototypical leader are affected by how an individual perceives himself or herself (i.e., the "ideal leader" has characteristics and qualities similar to those possessed by the individual, Keller 1999). However, we know little as to how implicit leadership theories might change over time, but we can assume that a young child's parent prototype leader and the accompanying implicit leadership theories are replaced by prototypes of famous historical leaders and shaped by work experience (we will return to this point later).

While ILTs can be different for different individuals, research has shown that there are some aspects of implicit leadership theories that are shared within a particular culture. The GLOBE study has mainly focused on finding similarities between cultures, while another research has investigated idiosyncrasies in implicit leadership theories across cultures. An important differentiation here might be that GLOBE concentrated on ideal images of leaders (i.e., what is characteristic of successful leaders in a culture) where other studies used a reference to general leader images (i.e., what is characteristic of a typical leader, Schyns and Schilling 2011). This differentiation is important to keep in mind when conducting work on implicit leadership theories as the images of ideal versus typical leaders only overlap for some people but less so for others.

While most research on ILTs focuses on a differentiation between leaders and non-leaders, in their seminal work on implicit leadership theories, Robert Lord and his colleagues argue that implicit leadership theories can vary depending on the sector or business. For example, if a person is told that a leader is the Chief Executive Officer of a large bank, the expectation as to what this person will be like is different than if the leader is the coach of a sports team, or a political leader, although some general leadership characteristics will be the same. We now turn to look at why implicit leadership theories are important in the context of the leadership process.

## Effects of Implicit Leadership Theories on Perceptions and Attributions

One question that researchers and practitioners often ask is how do certain individuals become leaders and how do others become followers?

Implicit leadership theories can help us understand this process. Scott DeRue and his coauthor Susan Ashford (2010) describe this as a claiming and granting process: Some people claim the leader role, while others (followers) grant that individual the leader role. Conversely, individuals may make the decision to follow a leader and are accepted by the leader as followers, using the same claiming and granting process. So, why are some people granted the leadership role, while others are not "granted" leadership? According to implicit leadership theory, individuals use their cognitive representations as a guide in this process. The leadership role will be granted, if there is a match between (followers') implicit leadership theories and the target person's qualities and behaviors but will not be granted if there is no match. At the same time, if persons feel that they do not possess the qualities and behaviors that match their own implicit leadership theories, they are less likely to be motivated to claim leadership.

Turning now to exciting relationships between leaders and followers, another issue that leadership researchers and practitioners are interested in is influences on ratings of actual leaders. Here implicit leadership theories are useful to understand why leadership ratings do not (only) reflect leader behavior but are also a reflection of our images of leaders.

Specifically, our implicit leadership theories can mislead us in a number of ways. For example, imagine that you are told that you will be meeting the governor of a distant state. According to ILT, you will have formed expectations about what this leader is like – he is male, tall and distinguished, and confident. Instead, you are introduced to a diminutive woman who is, in fact, the governor. Now imagine that you are asked to rate how effective you think she might be as a leader. Your ILT will likely shape and bias your evaluation of this leader. Because of the mismatch between your implicit leadership theories and the actual leader, you might be less likely to assume that the person you just met is an effective leader.

Implicit leadership theories are therefore problematic in terms of ratings of leaders when it comes to performance. This is particularly the case when leader assessments involve retrospective ratings of leaders – asking raters to assess the leader's performance over the past months or year (s). This requires relying on memory and can be colored by implicit leadership theories to fill in the gaps in recollections. That is, raters "remember" behavior that fits with their implicit leadership theories but has not actually been shown by the leader. In other words, what is reflected in those ratings is likely to be a combination of actual behavior shown and expected behavior based on implicit leadership theories.

This means that implicit leadership theories are also used to fill in gaps in knowledge. How does this process work? For example, Lord et al. (1984) suggest that when one particular leadership behavior is observed, a perceiver will often assume that another leadership behavior was also present. This has obvious and severe consequences for the way we measure leadership. Typically, leadership is assessed by asking followers to rate the frequency with which a leader shows a particular set of leadership behaviors. But implicit leadership theories suggest that if followers have positive regard for their leader, then they are likely to report that their leader actually performed positive leadership behaviors. In other words, because of their implicit theories, they simply assume that their leader would exhibit the desired behaviors. Thus, implicit leadership theories suggest that dimensions of ILTs are connected to one another in a network style. When one dimension of an ILT is activated, another dimension is also activated.

The problem of measurement in leadership does not stop at leadership behavior. Indeed, implicit leadership theories are also related to ratings of leader performance. An interesting series of studies has shown that our implicit leadership theories work in more ways to "deceive" us when we observe performance: Lord and Maher (1991) have shown that information given about a group's performance influences the amount of leadership that is attributed to the leader of that group, even when the actual behavior of leaders was not different in a high-performing versus a poorly performing group. We conclude, from the simple fact that a group does or does not perform

well, that leadership must have been present and must have had an effect.

This tendency to assume (good) leadership on the basis of good results seems to be prevalent in evaluating leadership on the basis of company success as well. For example, the very same leader can be judged very differently depending on the success of the company he/she works for. We appear to make retrospective assumptions and evaluate the same behavior as good or bad depending on the results or outcome (what is often termed the "Halo effect," Rosenzweig 2007). Similarly, Meindl (1990) introduced the concept of romance of leadership, arguing that there is a general tendency to attribute a great deal of the success or failure of teams or companies to leaders, which might prevent a deeper analysis of the actual complex interaction of factors that lead to success or failure. In other words, there is a tendency to over-attribute cause to the leader and pay less attention to the efforts of the followers or the characteristics of the situation that impacted group or company performance.

Similar to evaluations of a leader's effectiveness, a match between individuals' implicit leadership theories and their perceptions of their leader seems to influence how they rate their relationship with their leader (Epitropaki and Martin 2005). For example, followers with leaders who fit their ILT will tend to have higher levels of satisfaction with the leader and their relationship with him or her, and they may be more committed and dedicated to the team and organization and more motivated to work hard. Conversely, a poor match between a follower's ILT and the leader's qualities and characteristics can lead to lower levels of satisfaction, commitment, and motivation to perform.

Again and taken together, this mismatch between ILTs and actual leader characteristics can lead to a great deal of bias and prejudice. If an individual holds an implicit leadership theory that the best leaders are male, or of a certain ethnic or cultural background, it can affect how willing the individual is to grant leadership, or how the person reacts to a specific leader, based solely on how well the leader fits the individual's ILT. This has important implications for the ability of members of minority or marginalized groups to attain leadership positions and, perhaps, to how a leader is evaluated. Cultural differences in ILTs can also come into play in multinational organizations when a leader has a different cultural or ethnic background than the majority of followers.

There is little doubt that implicit leadership theories play a part in why there are relatively few women and minorities in high-level leadership positions in the United States and elsewhere. Of course, as times change and greater numbers of women and minorities attain positions of leadership and are successful in them, the ILTs of people may also change and lead to a broader implicit theory about what leaders should look like in terms of their sex and ethnicity.

The above cited research suggests that most ratings of leaders and leader behavior as well as their performance are inaccurate and lack objectivity because they are largely influenced by the rater's implicit leadership theories. In fact, a challenge for the future of implicit leadership theory research is developing accurate ways of measuring leadership effectiveness that do not rely so much on others' ratings of leader performance. Therefore, we will now turn our attention to the measurement of implicit leadership theories.

## The Measurement of Implicit Leadership Theories

Measurement of implicit leadership theories has been traditionally undertaken by using questionnaires and asking participants to rate how representative a certain trait is for a typical (or ideal) leader. While this approach has been useful in increasing our knowledge of implicit leadership theories and underlying processes in leadership, it has been criticized for not tapping into the "implicit" aspect of implicit leadership theories adequately. As a result, alternative means of measuring leadership have been proposed.

One way of looking into implicit leadership theories and gender biases is by not measuring implicit leadership theories and gender stereotypes at the same time. Research has used a design where groups of individual are asked to rate the

characteristics of "manager/leader," "male manager/leader," and "female manager/leader." Participants are usually divided into groups and asked to rate a large number of characteristics referring to either typical leaders, typical men, or typical women. Researchers then look for an overlap (or lack thereof) between gender and leader stereotypes (or implicit leadership theories). Results tend to indicate that the ratings of the unspecified manager are more similar to ratings of "male manager." This has been termed the think-manager-think-male bias (Schein 1973). Note that, in this case, the first group is the comparison group so that participants should be less likely to respond in a socially desirable way than if they were asked about all groups at the same time.

To get deeper into the implicit aspect of implicit leadership theories, Lord and colleagues have suggested using word fragment tests. Here, participants are presented with short words with some of the letters missing and are asked to fill in the missing letter or letters. The word fragments are structured so that they can be filled in in different ways, creating different words. The assumption is that what comes into the mind of the participants first when seeing the word fragment is nearer to his/her implicit leadership theories.

Though to date mostly used in research on stereotypes, implicit association tests could also potentially be used in implicit leadership theories research. In this type of assessment, what is assessed is the reaction time to two connected stimuli. To study implicit leadership theories, these stimuli could be composed of characteristics typical for leaders and non-leaders. Participants would then be given a number of such characteristics and asked to indicate by pressing a key if this is typical for a leader or a non-leader. Quicker reaction times could then be used to determine the contents of a person's implicit leadership theories.

An approach that taps less into the measurement of implicit leadership theories, but more into what we actually do with what we have assessed, is the pattern approach. Here, what is investigated is the extent to which people differ in how their implicit leadership theory dimensions cluster together. Roseanne Foti et al. (2012) have conducted seminal work in this area which can be easily translated to implicit leadership theories research. Here, respondents can be asked about their implicit leadership theories, but rather than using individual dimensions of implicit leadership theories, the participants are then divided into types based on their implicit leadership theories pattern. Thinking about the connectionist approach to implicit leadership theories, that is, that we remember behavior that is not there because it in our implicit leadership theories connected to another behavior that is actually shown, a pattern approach can be used to improve our knowledge on biases in leadership perception. That is, when some people hold implicit leadership theories consisting of a pattern of including, say, high values on the dimensions intelligence and dedication, they are more likely to rate their leader as intelligent when they have only been able to observe behavior related to dedication, as, in their minds, these two dimensions are connected.

There has been some research exploring another type of implicit theory, what Sy (2010) calls "implicit follower theory." This is interesting here because some of this research has used a different methodology than the classical approach used in implicit leadership theory research. Specifically, in this research implicit followership theories are primed by exposing them to pictures with words associated with good or bad followership. While this is slightly different from assessing implicit theories, it is a promising new approach to investigate the role of short-term induced implicit theories on subsequent behavior.

So, how can we improve ratings of leaders, knowing that implicit leadership theories influence those ratings? A first step would be to assess implicit leadership theories in a group of followers and control for them in ratings for leaders, before giving feedback to leaders. At the same time, knowing about implicit leadership theories of their followers might help leaders to more successfully engage in a claiming leadership process.

It also has been suggested that using "online" assessments, on a more frequent and ongoing basis, might minimize the bias induced by implicit leadership theories. That is, rather than using, say,

a yearly 360° feedback process, followers could be asked every week for a few weeks in a row how their leader behaved in that week. This reduces the reliance on memory processes because the period that is rated is shorter.

## Future Research

Most research into implicit leadership theories focuses on the dimensions and structure of implicit leadership theories, on the match between implicit leadership theories and actual leader perceptions, or on the effect implicit theories have on leader-follower relationships. It would be interesting, however, to look further into other effects of implicit leadership theories, such as the potential for team members' reduced effort when their implicit leadership theories do not match their perception of a leader. Another avenue for exploration is the negative effects implicit leadership theories may have on the relationships between leadership perceptions and outcomes.

As outlined above, the measurement of implicit leadership theories is potentially another area for future research as, at this moment, we are not tapping sufficiently into the more implicit, subconscious aspects of implicit leadership theories. One concern in terms of measurement relates to social desirability bias, although this may be less of a concern in the area of leadership, as compared to research on other types of stereotypes. It would be interesting to see how far implicit measurements can help improve the predictive capabilities of implicit leadership theories.

While Ayman-Nolley and Ayman have shown that already children have implicit leadership theories and Keller links them to parental images and ideal images of the self, we know very little about the origin and, linked to that, changeability of implicit leadership theories. Implicit leadership theories have been linked to experiences, but does that mean that there is an incremental change in implicit leadership theories over one's work life or are changes potentially short lived and individuals fall back on their "original" implicit leadership theories after a while? If we can prime implicit followership theories, does that mean we can create experiences that permanently change a person's implicit leadership theories? And what would those experiences be? Would they have to be directly linked to leader behavior (i.e., change the contents) or to the link between leadership and behavior (i.e., change the assumption that leadership is responsible for outcomes) or the link between dimensions of implicit leadership theories (in the sense of creating a different network of connections)? This type of future research would help addressing how to improve leadership perceptions by reducing biases based on implicit leadership theories.

Implicit leadership theories seem to have become the starting point for other implicit theory research. Examples include implicit followership theories that operate when describing typical followers. Again, implicit followership theories will impact follower and leader behavior and how they interact with each other. For example, if a leader thinks of followers in general as incompetent, he/she will be less likely to delegate to followers.

Another example are implicit voice theories (Detert and Edmondson 2011) which refer to assumptions about whether or not it is appropriate in a certain organizational context to speak up or not. Again, these happen between leaders and followers and influence their interactions with each other.

## Summary and Conclusions

Implicit leadership theories are cognitive structures or everyday stereotypes about leaders that are activated when we are confronted with a "leader." They influence perceptions and evaluations of leaders and are therefore possibly responsible for measurement error as well as incorrect feedback to leaders or issues in the selection of leaders when someone does not fit the implicit leadership theories of their (current or future employees).

The interesting issue regarding implicit theory and implicit leadership theories specifically is the very fact that they are implicit and yet still bias perceptions and shape interactions. Since they work similarly to stereotypes, we can assume that they are relatively stable (even when there is

evidence of counter-stereotypical information) and they are potentially difficult to change. However, this is a point where more research is needed to examine this assumption. Leadership research could benefit from taking into account implicit leadership theories more fully when asking followers to rate leaders, therefore improving the feedback given to leaders. At the same time, making leaders aware of implicit leadership theories, their followers could potentially help improve relationships between leaders and followers as well as the process of "granting" influence.

Implicit leadership theories are also relevant when drawing conclusions about the relationship between leadership and success or failure. A more thorough knowledge about how implicit leadership theories shape our assumptions can help facilitate better change processes which go beyond simply hiring and firing managers because they are believed to be solely, or primarily, responsible for performance outcomes.

# Improving Energy Sector Accountability in Trinidad

Debbie A. Mohammed
University of the West Indies/Arthur Lok Jack Graduate School of Business, St. Augustine, Trinidad and Tobago

## Synonyms

Responsibility mining sector; Upgrading

## Definition

Accountability is the obligation of power holders to take responsibility for their actions.

Transparency in terms of being without a hidden agenda and conditions.

## Introduction

"Accountability" has now become a "buzzword" among members of the international community and associated with it are words like "transparency" and "good governance." These words are

increasingly linked to the conduct and practices of corporations as well as governments, since they appear to have significant correlation to issues of profitability, equitable distribution of resources, national development, and resource sustainability. One of the areas where these words form part of corporate reality is in the sphere of the extractive industries sector. This chapter explores the manner in which the Trinidad and Tobago Extractive Industries Transparency Initiative (TTEITI) can contribute to improving accountability within the energy and quarrying sectors of Trinidad and Tobago. The issues implicated here are that:

1. As it currently stands, there exist questions in terms of accountability within the energy and quarrying or mineral sectors.
2. The TTEITI has a role to play in finding the solutions to these problems.

## Background and the Significance of the TTEITI

In 2002, the then prime minister of the UK, Tony Blair, launched the Extractive Industries Transparency Initiative (EITI), a global endeavor aimed at promoting elements of good governance – transparency and accountability – within the extractive industries, which include oil, gas, and mining. This goal is achieved by independently verifying that payments made by companies to governments of those countries in which they operate match revenues reportedly received by governments. The EITI "contributes to consolidating and improving governance in resource rich countries, fights corruption, reduces conflicts and encourages increased foreign direct investment" (Trinidad and Tobago Extractive Industries Transparency Initiative 2016).

On March 1, 2011, Trinidad and Tobago was admitted to membership with EITI candidate country status and as of January 23, 2015, is classified as an EITI compliant country, one of the 28 other compliant countries of the 51 EITI member countries. As a member of the EITI, the Government of the Republic of Trinidad and Tobago publishes annual reports, and if any discrepancies are found between the figures that it reports and those published by companies operating in the country, it inherently agrees to allow an independent investigation to be conducted for which the results will be made public. (Trinidad and Tobago Extractive Industries Transparency Initiative 2016). The TTEITI Steering Committee was established by the Trinidad and Tobago Cabinet in September 2011 with the objective of making Trinidad and Tobago a compliant country by August 2013, the date set by the EITI. The TTEITI Steering Committee comprises representatives from the government, civil society, and energy companies and recently included representatives of the quarrying sector.

The importance of an institution like the TTEITI cannot be overstated in an energy-driven economy such as Trinidad and Tobago. Given its contribution to the domestic economy, 36.2% of GDP (invesTT 2016), the energy sector is a major determinant of the pace and trajectory of this country's development. It is imperative, therefore, that all the stakeholders in the development of Trinidad and Tobago – government, corporate entities, civil society, and the average citizen – be aware of how the local energy sector is contributing to the improvement of the country's overall standard of living. Furthermore, all stakeholders must feel satisfied that energy companies conform to international standards of best practice, not only in terms of environmental and resource responsibility but also that national resources reach all in society, particularly impacted communities, the poor, and vulnerable.

When a practice of accountability, transparency, and governance across public and private sectors develops and is accepted as a norm by all parties, inclusive of citizens, this eventually and inevitably translates to improved understanding of the role and function of government and empowers the citizenry to monitor and hold representatives accountable. This strengthens the democratization process which positively impacts all stakeholders in a society. The added involvement of sensitized multi-stakeholders invariably contributes to more effective and targeted policy making and implementation since policy makers not only understand that they are accountable to the citizenry, but they recognize the need to allocate limited resources fairly, so that benefits

accrue to all, particularly the most vulnerable. In this way, policies relating to growth, development, and sustainability become more meaningful. Greater awareness by citizens of the monetization of the country's resources and how the revenues generated from these resources are utilized and are fundamental component for building transparency and for promoting more meaningful development-related policies for the future.

## What Is "Accountability"?

"Accountability" as a concept has become popular in a globalized economic system where the impacts of irresponsible behavior on the part of corporations can have tremendous financial implications not only on shareholders but on countries globally. Accountability, while initially used in the context of corporate entities, has been extended to include governments and public enterprises and can be defined as "the obligation of power holders to take responsibility for their actions." It underscores "the dynamics of rights and responsibilities that exist between people and the institutions that have an impact on their lives" (United Nations Development Programme 2013).

While accountability itself may be considered from different perspectives, the point of focus here will be on social accountability and corporate accountability. An exploration of these will help to create a more holistic understanding of the relationship between accountability and the Trinidad and Tobago energy sector. Moreover, as the issue of sustainable development is considered at the global level, understanding the general concepts surrounding accountability in the energy sector will allow for a clearer understanding on the part of citizens of their civic duty in terms of both their rights and responsibilities in policy implementation and execution, as well as the role that could and should be played by the TTEITI.

## Social Accountability

According to the World Bank, social accountability extends beyond conventional state mechanisms, such as voting, into other instruments that citizens can utilize to directly "hold the state to account" (World Bank 2006). Social accountability may be one of the more vital kinds of accountability as there is an importance placed on citizens' involvement in the affairs that directly affect them.

## Corporate Accountability

Corporate accountability may be considered as "the ability of those affected by a corporation to control that corporation's operations," including environmentally and socially related responsibilities (Friends of the Earth 2005). The difference between social and cooperate accountability is that the latter carries with it the weight of a legal obligation: not only are companies expected to act in a manner that places the well-being of the rest of the society at the forefront, but they are obligated to create and adhere to a legal framework which allows them to do so; nonadherence, therefore, can have legal ramifications. While this may sound straightforward in theory, in reality this is quite complicated, as companies are being asked to balance their raison d'etre – the drive to attain profit – against global and national sustainable development objectives.

## Accountability in the Trinidad and Tobago Energy and Mineral Sectors

The revenues gained from the energy sector account for about 34.9% of Trinidad and Tobago's GDP (Ministry of Energy and Energy Industries 2016). Most of this comes from the oil and gas sector. In more concrete terms, the EITI report published in 2016 shows that in 2013, the Trinidad and Tobago government received USD 3,305,270,000 (or TTD 21.4 billion) from its extractive industries (Kjerstin and Ponsford 2016). Indeed, reports published by the TTEITI for 2013 and 2014 showed minor discrepancies in reconciliation of revenues reportedly received by the government for these years and payments reportedly made by energy companies. These discrepancies were explained by the independent auditing firm undertaking the reconciliation as relating to issues of payment cycles of the national tax collection agency.

What currently presents as a cause of concern is the reporting of figures in the mining (quarrying) sector. In Trinidad and Tobago, "[m]ineral mining is conducted for sand and gravel, yellow limestone, porcellanite, clay, blue limestone, red sand, oil sand and asphalt. Sand and gravel, yellow limestone and porcellanite account for the majority (73%) of mineral production" (IPAN 2014). In April 2016, the Minister of Energy and Energy Industries of Trinidad and Tobago disclosed that between the years 2003 and 2015, only TTD 18.5 million was paid in royalties to the government. This figure is seen as being "inadequate given the scale of the mining sector" and indicates that there exists underreporting on production and royalty payments from that sector. Furthermore, the 2014 Green Paper on Minerals Policy indicates that between 2001 and 2013, less than ten percent of the royalties due to the state were actually collected (Ministry of Energy and Energy Affairs 2014). This has translated to a loss of TTD 120 million in revenue and does not take into account losses in revenue from production through illegal mining (quarrying) and other sources such as taxes, business levy, and green fund levy within the same period (The Government of the Republic of Trinidad and Tobago 2016). This has led to the conclusion that the mining sector contributes to 0.1% of the country's GDP (Ministry of Energy and Energy Affairs 2014).

Victor Hart, chairman of the TTEITI, considers the mining sector "a very opaque sector" of the Trinidad and Tobago economy and is of the opinion that getting the mining sector to adopt TTEITI regulations presents as a challenge for the institution (Cleavon 2015).

## The Role of the TTEITI in Addressing the Challenge of Corporate Accountability and Responsibility in the Mining Sector of Trinidad and Tobago

Transparency, mentioned at the start of this article, is a cornerstone of good governance, another practice for which the international community is increasingly campaigning. As many resource-rich countries, Trinidad and Tobago remains under the global microscope for issues that formed the impetus for the creation of the EITI: corruption, mismanagement of revenues, unsustainable production mechanisms, environmentally unfriendly practices, and rising levels of poverty. The fact that Trinidad and Tobago has opted to become a member of and adhere to the regulations of an institution like the EITI speaks to its desire to more responsibly manage the resources of its people and to tackle the vexing issues of corruption and its associated ills.

One of the main areas of focus of the government of Trinidad and Tobago in the sphere of natural resource management has been the issue of environmental protection and conservation. Issues of environmental sustainability are known to impact on the level of development advancements attempted by smaller, developing countries. The extractive industries in particular are seen as major contributors to pollution and environmental destruction, and attempts can only be made to address this when the relevant authorities are aware of the parties with whom they must engage. Companies involved in the oil and gas sectors in Trinidad and Tobago appear to be open and, from publicly available reports, seem to have been fulfilling their corporate duties with regard to transparency and accountability of revenues as well as their responsibilities toward the environment. This may be attributed to the fact that many are global firms that have already adopted these principles of corporate governance and accountability as part of their business practice. It should be noted, too, that this practice has been largely adopted by indigenous firms in the energy sector. The mining sector, however, as illustrated earlier, has not yet subscribed to the tenets of the TTEITI in this regard.

Part VII of the Minerals Act of 2000 outlines in some detail the expectations of mine operators in relation to the environment (Republic of Trinidad and Tobago 2000b). It does not, however, speak to issues of accountability and transparency. Evidently, this document was created before the TTEITI was ever a factor for consideration in resource extraction and management, but an updated Minerals Act can provide one avenue through which the TTEITI can monitor the activities – both financial and environmentally related – of those operating within the mining industry.

Similarly, the Environment Management Act of 2000 must play a part in the management of the extractive industries. It lists as one of the functions of the Environmental Management Authority (16, 1(g)) to "monitor compliance with the standards criteria and programmes relating to the environment" and (16, 1(i)) to "establish and co-ordinate institutional linkages locally, regionally and internationally" (Republic of Trinidad and Tobago 2000a).

These legal instruments must be implemented and enforced so as to assist the TTEITI in executing its functions and allow it to achieve the same measure of success in attaining internationally accepted standards of accountability, transparency, and good governance in the sphere of mining as it has done in the oil and gas sector. As an EITI compliant country, there is the added expectation that the mining sector should comply and maintain the international standards of conduct for companies in the extractive industries sector as prescribed by the EITI. The TTEITI primarily functions as a supervising and reporting institution and undoubtedly requires the assistance of the country's government and legal apparatus to assist it in executing its duties, especially with respect to companies which have not fully accepted the standards suggested by this umbrella body.

One of the issues that the TTEITI must contend with in the pursuit of accountability throughout the extractive sectors of Trinidad and Tobago is how to reconcile payments and revenues that are made *in kind* and which inevitably form part of the business transactions in any developing country. How do companies and the government account for these noncash payments? This is a major challenge for the TTEITI because it reflects the reality of business in the Trinidad and Tobago extractive industries. Another project which has been launched by the TTEIEI is the Beneficial Ownership Project, which seeks to identify persons who directly or indirectly own a company or controls at least 10% of company shares or total votes. Politically exposed persons, once benefitting from the company, are also deemed beneficial owners. The objective here is to track all parties who benefit from extractive company operations in Trinidad and Tobago to ensure greater transparency at all levels. One of the avenues that must be given more serious attention is the manner in which interagency cooperation functions in the country. There are various institutions that have already been established which, in theory, are equipped to deal with the management of the mining sector. However, their effectiveness is either lost or minimized because of poor communication among these institutions.

## Conclusion

The role of the TTEITI is critical for ensuring that Trinidad and Tobago continues to promote compliance with international EITI standards in *all* extractive sectors, and the TTEITI must therefore actively focus on bringing the mineral or quarrying sector under its ambit. The TTEITI has to date published three reports (2013–2015) and has undertaken an aggressive program of public advocacy and information dissemination to highlight the work of the TTTIEI and to sensitize citizens of the importance of transparency and accountability in these critical revenue-generating sectors. It is primarily through these activities of the TTEITI, continuously engaging with the government, private sector, civil society, and the general public, that Trinidad and Tobago can create a positive reputation locally and internationally for improving its social and corporate accountability in the extractive industries both energy and eventually quarrying. The challenge now is for the TTEITI to move beyond promoting financial accountability and transparency in the extractive industries, to track *how* financial gains derived from these industries are utilized and *who* benefits from these gains.

# Improving Water Service Delivery Through Public–Private Partnerships in Botswana: A Grounded Theory Approach

Thekiso Molokwane
Department of Political and Administrative Studies, University of Botswana, Gaborone, Botswana

## Synonyms

Botswana; Operations support contracts; Privatization; Public administration; Public infrastructure; Public policy; Service contracts

## Definitions

Public–Private Partnership (PPP) implies participation of a private sector entity undertaking a project on behalf of a government where the government is entitled to retain the asset after completion (Tshombe and Molokwane 2016b, p. 73). PPP also refers to a collaboration between the government and a private enterprise geared toward provision and management of public infrastructure and services through leveraging private technical expertise as well as private capital.

## Introduction

The public sector has traditionally been the main actor in the production and distribution of public goods and services. Basic infrastructure such as provision of water, sewerage, and electricity were long seen as typical cases of natural monopolies and public goods (Thoenen 2007, p. 1). The role of the public sector in development, however, changed substantially in many countries especially from the mid-1980s (Ngowi 2009, p. 34). The rapid and widespread private sector participation (PSP) in the provision and financing of

I

infrastructure became more apparent in the 1990s (Harris 2003, p. 1) with the role of the state now reduced to that of a facilitator for the private sector-led economic development and growth (Ngowi 2006, pp. 3, 4). Innately, this shift in paradigm resulted in, among others, the advent of Public-Private Partnerships (PPPs).

PPPs, long-term agreements between a public authority and the private sector to provide public services, have become a popular approach to provide infrastructure development (Moszoro and Kryzanowska 2011, p. 1). The concept of PPPs entails various forms of collaboration between public and private sector organizations in service delivery (Ngowi, 2009, p. 34; Tshombe and Molokwane, 2016b, p. 73). By implementing PPPs, public authorities seek to benefit from cooperation with specialized partners (Batran et al. 2005, p. 128). Under PPPs, resources, skills benefits, and risks are shared. The aim is improved delivery of publicly funded goods and services (Dutz and Harris, 2006, p. 1).

Internationally, countries such as Argentina, Bolivia, and the United Kingdom, adopted PPPs in the 1990s (Izaquire, 1998, p. 1). African countries such as Mali, Cote d' Ivoire, Burkina Faso, and Gabon also experimented with PPPs in the water sector (World Bank, 2009, p. 1). In the Southern African Development Community (SADC) region, Mozambique, South Africa, and Botswana are among countries that adopted PPPs (Falam, 2005, p. 20). About one quarter of the populations living in rural areas and small towns in Africa, are served through piped water (Water and Sanitation Program 2010, p. 3). According to the Public–Private Infrastructure Advisory Facility (2010, p. 1), in Asia, Vietnam received financial support for two pilot projects in 2002 whose impacts have been positive.

Water has always been and remains an important, but scarce, commodity in Botswana (Molokwane and Tshombe 2017, p. 161). Its use is primarily for arable and livestock farming, household consumption, and industrial development (Matlok 2008, p. 2). Botswana is a drought-prone country with limited water resources and potential sites for water resources development. This situation is exacerbated by the low precipitation, limited groundwater recharge, and very high evaporation rates from surface water resources (Kedikilwe 2008, p. 6), hence the need to look beyond the already known in addressing the water problem in Botswana.

In Botswana, water, like other natural resources, is public property whose use and rights are defined and regulated by the Water Act-Chap. 34:01 and its subsidiaries, the Water Works Act-Chap. 34:03 as well as the Water Apportionment Act (Moyo et al. 1993). Water is therefore controlled and allocated by the state. Following the 2008 Water Sector Reforms (WSR), the supply and distribution of water as well as the management of wastewater is solely carried out by the Water Utilities Corporation (WUC).

In the early 1990s, the Government of Botswana developed its first National Water Master Plan (NWMP), which was reviewed in 2006 owing to Government's view that there were too many authorities responsible for water management (Mudanga 2011). Prior to this, portable water was supplied by the Department of Water Affairs (DWA), District Councils, and the WUC. The DWA operated in 17 major villages and formulated policy of the whole water sector. The 16 District Councils that fall under the Ministry of Local Government (MLG) provided water in rural villages while the WUC operated in 6 urban centers. The District Councils and the WUC also operated wastewater systems (Kgomotso and Swatuk 2006, p. 3; Mudanga 2011).

The need for PPPs has been felt throughout the years in Botswana. Botswana's PPP Unit is located in the Ministry of Finance and Development Planning. Elsewhere, PPP units provide funding to line departments and subnational agencies developing PPPs (Dutz and Harris 2006, p. 2). To this end, this study assesses the applicability and impact of PPPs to the water sector, which is now currently operated under a monopoly set up.

## Delivery of Water Service in Botswana

The traditional role of the state has, over the years, been the provision of public goods and services (Hughes (1998, pp. 101–104). Until the 1980s,

the provision of infrastructure was seen as preeminently the domain of Governments (United Nations Economic Commission for Africa 2005, p. 98), However, the 1980s saw the introduction of the private sector in the provision of publicly funded goods and services. This new paradigm would find expression in policies of liberalization (Cook and Hulme 1998, pp. 221–31).

In order to bridge the gap between available resources, the cost of needed infrastructure and services as well as to ensure that infrastructure services are delivered as efficiently and cost effectively as possible, public authorities are now turning to PPPs (Partnerships Kosovo 2009, p. 3). The benefits of implementing PPPs include the delivery of greater value for money where assets are procured conventionally; expansion and maintenance of infrastructure and services through innovative and efficient ways used by the private sector (Republic of Botswana 2005, p. 158), this provides the Government with an opportunity to focus on its core functions that include among others maintenance of the rule of law, governance and provision of pure public goods and services. PPPs are currently being extended to new areas and are now taking new and significant forms (Renda and Schrefler 2006, pp. 4, 5; Corry et al. 2000, p. 1).

In Botswana, the management of water and wastewater services is centralized under the WUC. The centralization is being implemented through the WSR. Upon implementation, the reforms sparked many negative media reports (Mmegi 2011). The reports indicate that the take-over has had a huge bearing on consumers particularly the indigent people living in villages and rural areas. The take-over also brought about a sharp increase in connection fees where the fees went up from around P400 to P6000, a fee now higher than that of connecting electricity (Mmegi 2011). It has further been observed that the WUC is having trouble with collection of owed tariffs as its billing system is not compatible with that of the DWA and District/Town Councils (Sunday Standard 2012). Reports on unreliable water supply throughout the country have been extensive (Mmegi 2011).

Despite the WUC not providing new infrastructure in areas that are not already serviced, most of the rural areas that WUC took over do not have serviced land (Sunday Standard 2012). Provision of infrastructure remains the responsibility of the DWA and District/Town Councils. Although other public sector reforms in Botswana have in the past been evaluated, no attempts have been made either by scholars or practitioners to assess the possibility of applying PPPs to the water sector. Much of the focus in the procurement of infrastructure and services in the past two decades has been on outsourcing, which surpassed other forms of procurement (Liou 2001, p. 391). In recent years, PPPs have become a more preferred means of providing publicly funded infrastructure and services.

## Public–Private Partnerships in Botswana

The government of Botswana considers PPPs an alternative means of financing public infrastructure projects to accelerate and improve infrastructure development, and create a conducive environment for stronger public and private sector partnerships (Commonwealth Governance 2020; Republic of Botswana 2019, p. 7; Molokwane et al. 2019, p. 131; Republic of Botswana 2018, p. 7–8). Implementation of PPPs in Botswana has nonetheless been comparatively slow with a limited number of projects being undertaken through the PPP arrangement. Perhaps the country's first PPP project was the Partnership between the Botswana government and De Beers Mining Company (Botlhale 2016, p. 35) in the form of a company – Debswana. Subsequent projects that followed many years later implemented through PPP include Mongala and Mahube malls in Kanye Village. Mongala mall is a joint venture project between Time Projects and Southern District Council provided through the Build, Operate, and Transfer (BOT) PPP model. Another project is the Rail Park mall in the Capital City Gaborone a PPP project between Botswana Railways Properties, Botswana Insurance Fund Management (BIFM), Eris Property and Treddinick, which cost P350 million (Motshegwa and Molokwane 2019, p. 4; Sunday Standard, p. 2011). Others include the Ombudsman and Land Tribunal

Office (OLTO) as well as the SADC Headquarters building (Tshombe and Molokwane 2016a, p. 310).

Botswana has over the years experienced challenges in its effort to implement PPPs. Factors affecting implementation of PPPs in Botswana include lack of finance (Molokwane et al. 2019: 140), lack of supportive infrastructure, legislation deficiencies, project implementation issues, and technical capacity issues (Motshegwa and Molokwane, 2019: 5, 6). In terms of legal framework, the country relies on the Public–Private Partnerships Policy and Implementation Framework of 2009, as its legal instrument for implementing PPPs (Motshegwa and Molokwane, 2019, p. 4; Tshombe and Molokwane, 2016b:81; Tshombe and Molokwane, 2016a, p. 313). This is used in conjunction with other pieces of legislation such the Public Procurement & Asset Disposal Act (No. 10 of 2002) (Molokwane et al., 2019, p. 135) and the Public Procurement and Asset Disposal Regulations 2014 (PPADB Regulations) (African Legal Support Facility & Public-Private Partnerships in Infrastructure Resource Center 2017).

Additional challenges to the implementation of PPPs in Botswana include absence of standardized approaches and processes guidelines to deal with the structure of PPP projects and uniform framework to guide treatment of tendered and unsolicited proposals. Furthermore, there is no clear role of government agencies and departments such as PEEPA, MFDP, and Ministry of Works and Transport, etc. (Republic of Botswana 2009a, p. 2; Molokwane 2018, p. 706). This challenge calls for a reform in Botswana's PPP Legal Framework in general (Motshegwa and Molokwane 2019, p. 5). The reform should include, among others, an independent PPP legal framework; avoiding high costs of contract negotiation and building capacity to accept unsolicited proposals (Axis Consulting 2013, p. 10).

A number of positives nonetheless are discernible and have sustained the country's state of economic performance. These include institutional safeguards such as: a PPP policy and Implementation Framework of 2009; an Anti-Corruption agency, namely, the Directorate on Corruption and Economic Crime (DCEC); a Financial Intelligence Agency (FIA); a Public Procurement body, namely, the Public Procurement and Asset Disposal Board (PPADB); and a PPP Unit located at the Ministry of Finance and Economic Development. While all these policy and institutional safeguards are present, their effectiveness and independence have often been under scrutiny (Molokwane 2019, p. 165).

## Conceptual Framework

Eisenhardt (1989, p. 532) posits that development of theory is a central activity in organizational research. The author observes that, traditionally, authors have developed theory combining observations from previous literature, common sense an experience. Citing Perrow (1986) & Pfeffer (1982), the author also maintains that it has been difficult to tie actual data to the development of a new theory. Eisenhardt (1989, p. 532) concurs with Glaser and Strauss (1967) that it is the intimate connection with empirical reality that permits the development of a stable, relevant, and valid theory.

The theory and model dichotomy debate remains topical to date. While scholars have used the two terms interchangeably, some remain adamant that they differ. Goldfarb and Ratner (2008, p. 92) theorize that the terms "theory" and "model" are incapable of carrying the diverse characteristics economists ascribe them. The authors define a model as "a system of functions and conditions that yield formal results, such as classes of equilibria within a model." Liu (2004, p. 7) however maintains that there is need for a study on the relationship between models and theory. Goldfarb and Ratner (2008, pp. 92, 93) cite and concur with Klein and Romero (2007, 243–244) that the terms "models" and "theory have been used as interchangeable in the profession." They ejected this equating of the two terms, asserting that a "model is neither necessary nor sufficient for theory." Two authors posit further that a "theory" has a higher normative status than "model" and that moreover, a theory does not require a "model." Liu, (2004, p. 5) substantiates

that a theory may consist of many models – tens of thousands. Conclusively, there is no consensus on this debate.

It is from this conclusion that this study selected the Grounded Theory method in order to generate a model. Babbie (2013, p. 536) defines grounded theory as an inductive approach to the study of life that attempts to generate a theory from the constant comparing of unfolding observations. Essentially, grounded theory attempts to derive theories from an analysis of the patterns, themes, and common categories discovered in observational data. Borrowing from Glaser and Strauss, Calman (2013, p. 2) asserts that the aim of grounded theory is to generate or discover a theory. For De Vos (2005) & Neumann (2007, p. 31), the aim of grounded theory is to develop a substantive theory that is grounded in the data or faithful to the evidence rather than being a theory itself; grounded theory therefore focuses on generating theory based on the study of social situations.

According to Eisenhardt (1989, p. 534), Glaser and Straus (1987) detailed their comparative method for developing the grounded theory. This method, he asserts, relies on continuous comparison of data and theory beginning with data collection. It emphasizes both the emergence of theoretical categories solely from evidence and an incremental approach to case selection and data gathering. This study's choice of grounded theory method is rooted in the study's preliminary findings that revealed the absence of a definite, written partnership owing to the WSR at the WUC. Consequently, this study was compelled to generate either a theory or a model suitable for implementation at the WUC-LMC that would enable the corporation to have a clear relationship with the private companies illustrating the dynamics of such a relationship(s).

## Methodology

This study adopted a case study strategy permitting focus on a single case. This compelled the study to devote careful attention to a specific case (Yin 2004; Creswell 2009, p. 13). Based on the nature of the research problem, this study adopted a qualitative approach for both data collection and analysis. The qualitative tradition however is based on interpretivism and constructivism, both of which stem from the idealist outlook (Deshpande 1983, pp. 101–110; Sale, Lohfeld & Brazil 2002, pp. 44–53 cited in Slevitch 2011, p. 76). Further to this, qualitative research is exploratory and is frequently used to investigate a subject area in which there is limited information (Tshombe and Molokwane 2016a, p. 306) as such; it can be argued that qualitative data in business research provides a more "real" basis for analysis and interpretation (Collins and Hussey 2003, p. 163). To this end, the LMC was selected as the case to be studied.

This study also applied the grounded theory method and generated a PPP model for possible implementation at the LMC. While the grounded theorists seek to enter the field with no preconceptions about what they will find, Burawoy as cited in Babbie (2013, p. 338) suggests the opposite. He contends that researchers should try to lay out as coherently as possible what they expect to find in their site before theory. In addition to this, he sees the extended case method as a way to rebuild or improve theory instead of approving or rejecting it.

### Case Selection, Criteria, and Justification

The WUC-LMC was selected as the single case to be studied in this research. Purposive sampling technique was used to select respondents. Purposive sampling is used in situations where the researcher uses their judgment in selecting cases with a specific purpose in mind (Neuman 2007, p. 142). Three situations that apply to purposive sampling make this approach relevant to this study. First, purposive sampling is used to select unique cases that are especially informative, second, to select members of a difficult-to-reach, specialized population, and third, to identify particular types of cases for in-depth investigation. In purposive sampling, the purpose is less to generalize to a larger population than is to gain deeper understanding of types (Neuman 2007, p. 143).

One-to-one semi-structured interviews were conducted mainly with key informants. These

included senior and middle management as well as staff from lower levels. One of the roles of in-depth interviews is to manage the research process by supporting the interpretation of results from surveys and other quantitative methods (Prairie Research Associates 2013, p. 1). Focus group discussions (FGD) were also conducted. FGDs are undoubtedly valuable when in-depth information is needed about how people think about an issue, their reasoning about why things are as they are, why they hold the views they do (Bell 2010; 167; Silverman 2005, p. 237).

## Sample Size

Borrowing from Guest, Bunce and Johnson (2006), Mason (2010, p. 3) set 15 as the smallest acceptable number for qualitative interviews. Alder and Alder (2013, p. 8), however, observe that at the low end of "how many" questions, numerous well-respected and even classic studies have been produced using the single case study with some of the studies having relatively few people, such as between 6 and 12 respondents.

For this study, the sampling unit consisted solely of technical and management staff and excluded staff from the Department of Corporate Services. Views were also sought from the WUC customers. Five focus group discussions and six in-depth interviews were conducted. According to Tuckett (2004, p. 2), there are no hard and fast rules regarding sample size in qualitative research. To illustrate, studies in the field of old age and aging used experimental cell sample sizes from 10 to 100 with clustering around 50. Others suggest 12 to 20 (Mason 2010, p. 3; Zickmund 2010, p. 3).

## Applying the Key Principles of Grounded Theory Method to the Emergent Theory

There are three approaches to data analysis, namely, language-based analysis, descriptive or interpretative analysis, and theory building (Rintala 2004, p. 89). This study adopted the theory building analysis which facilitates development of a theory based on collected data. Transcripts were coded and sorted into excerpt files in line with themes in the interview guide. The excerpt files were then further coded in accordance with new themes emerging from the data when coding the interviews, caution was exercised not only to code the actual content of the responses but also captured the context in which the responses were made (Fig. 1).

### Coding in Grounded Theory

Grounded Theory coding is a form of content analysis used to find and conceptualize underlying issues among the "noise" of the data Allan (2003, p. 1). In this study, data analysis, which began with coding, was done manually. As espoused by the Glaserian approach of Grounded Theory, the interpretative, contextual, and emergent nature of theory development is reliant on an "open coding" approach which starts by scrutinizing the field note or interview "line by line" or "word by word" with the eventual aim of producing concepts that "fit the data" (Kelle 2007). It was during this process where the study was alive to words and phrases that highlighted issues of interest to the study.

### Categories

When analyzing qualitative data, this study paid particular attention to the issues of importance versus prominence. According to the Soul City Institute of Health & Communication (2003, p. 43), the frequency of responses does not mean the same as in quantitative data analysis, viz., something that is said only once is as important as that which has been repeated many times. The study further distinguished between prominent themes and less prominent themes by seeing whether the themes were repeated across different interviews. Themes can be interpreted and presented based on an analysis of the weight of the theme.

### Negative Case Analysis

During data analysis, several instances where data did not fit were found. Responses that tended to sway in a different direction from others demanded particular attention and data that could not easily be discarded would otherwise be useful in later interviews. Such data were temporarily shelved, some of which emerged in subsequent interviews and could be used to form new categories.

**Improving Water Service Delivery Through Public–Private Partnerships in Botswana: A Grounded Theory Approach, Fig. 1** Data collection and analysis phases (**Source:** Author)

### Constant Comparison

The use of Grounded Theory method entails a dynamic relationship between sampling, data collection, and analysis. This means that the methods of sampling, data collection, and data analysis should not be considered as separate steps in research, but as part of a continuous cycle of data collection, analysis, and sampling (Elliott and Lazenbatt 2005, p. 50). Data were collected over a period of 18 months, as such, data collected were periodically analyzed to seek emerging categories with additional categories sought through the process of theoretical sampling. Emerging categories were then compared constantly with those from other stages of data collection.

### Theoretical Sampling

The objective of theoretical sampling, therefore, is not to increase the number of respondents, but rather to try and find out if new categories will emerge from additional data. In this study, theoretical sampling was conducted in three stages. The first stage involved sampling of respondents at Lobatse office, to seek initial information. This was done until basic categories were established through the use of open coding. The second stage involved a search for new concepts and properties of the already existing categories. Theoretical sampling also involved seeking new categories as well. Allan (2003, p. 51) notes that Grounded Theory uses "theoretical sampling" to sample events that are indicative of categories, their properties and dimensions so that they can be developed and conceptually related.

### Theoretical Saturation

Constant comparison of data was used to decide that saturation or redundancy had been reached. Proclamation of saturation was grounded in the empirical confidence attained from repeatedly comparing data to additional data (Tuckett 2004, p. 8). It was at a point at which no new categories were emerging; and no new information coming forth that interviews and data analysis ended.

### Writing Memos

Memos are an "intellectual capital in the bank" (Clarke 2005, p. 85) that vary in subject, intensity, coherence, theoretical content, and usefulness to the finished product (Birks and Mills 2010, p. 10). This study utilizedthe technique of memo writing throughout the stages of report writing, which helped during the process of axial coding where the relationships between coded elements of the

data were searched for. The use of memos also guided in determining the point of saturation when collecting data (Tuckett 2004, p. 8).

## Research Findings and Discussion

The performance of the WUC indicated a decline in a period of 3 years. Similarly, the water situation deteriorated across the LMC in the period under study. Factors causing this decline were twofold. First were the operational and infrastructure factors. Second, were administrative and business processes that were found to be outdated given that the WUC assumed the sole responsibility for water supply and management of waste water since 2008. A detailed discussion follows.

The primarily cause of water shortage were frequent bursts and water leakages resulting from dilapidated pipes. In some parts of the LMC, the WUC inherited obsolete infrastructure from previous authorities (Molokwane and Tshombe 2017, p. 171). A water loss reduction was found to be the most viable solution to this problem. A practical example elsewhere is the Malaysian City of Sandakan in which physical losses were being reduced by almost 17.5 million liters per day (Mld) following a 30-month contract (Pilcher 2005). The key factor is to identify the number of leakages particularly per cluster and reduce real or physical losses as well as replacing the mains with the highest burst frequencies.

The inherited infrastructure also experienced diminishing capacity as it was solely intended for towns and had changed to supply water to villages as well. New connections in additional villages greatly reduced the capacity of the infrastructure hence this resulted in under performance. The pipeline from Gaborone to Lobatse was now compelled to operate at maximum capacity after this change. Nonetheless, the required 80% of water that was supposed to, at any given moment, be in storage tanks was often affected. The 80% was required so that fresh water can be easily supplied without sourcing from the treatment plant for the next 48 h should there be a breakdown. It can be concluded therefore that there is need to replace existing pipes with those of larger volumes of water.

Investing in infrastructure has long-term benefits particularly where the use of such infrastructure increases in future. In the United Kingdom, for instance, a study conducted by the Global Water Security (2010, p. 26) found out that the application of best practice in finding and repairing leaks, managing pressure and replacing mains, if applied by all water companies, suggested that leakage could be reduced by 30% from the level in 2009 (1000 million liters per day) by 2025. A critical factor at national level supporting investment in infrastructure is that Botswana has both financial and institutional capacity to invest.

Repairs and maintenance of boreholes and pump stations proved problematic and took time particularly where spare parts were to be sourced externally. A Republic of Botswana (2009b, p. 13) report documented water loss through pipe leakages and pipe bursts; unaccountable water usage was 24% in 2007. That the WUC contracts PrivateCos in the repair and maintenance of boreholes and pump stations was a clear sign that service contracts can be successful if implemented in the LMC. The missing factor is policy and institution and legal framework at level of the WUC LMC to ensure that the Center adopts a systematic way of contracting PrivateCos. At the national level, a PPP Policy and Implementation Framework introduced in 2009 supports the implementation of PPP; hence there is a need, at the local level, for organizations to tap into this policy to design policies and guidelines governing their relationships with PrivateCos.

While red tape is a common challenge within the government in developing countries, the WUC is a parastatal mandated to operate commercially. It was not expected to find red tape as cause for concern on performance as mentioned by some of the respondents. The recurring power cuts were most prominent in the year 2013. Consideration for alternative sources of power did not go beyond backup generators. With abundant solar energy, it is only logical that the WUC consider installing solar panels to operate some of its boreholes and pump stations in order to cut cost of procurement, and use of electricity and fuel remains costly. While the commitment to use solar power has always been there (Republic of

Botswana 2005, p. 11; UN System in Botswana 2007, p. 29), not much has been done to implement such.

The water billing system was criticized by customers charging that the amounts were too high. The explanation from the WUC however is that previous authorities did not bill customers consistently and accurately. Political expediency was also blamed for low tariff setting as councils were led by politicians while the government (DWA and Councils) was blamed for being too considerate when setting tariffs and collecting payments as water is a naturally public good. The delays in new connections are linked to business process that call for digging of trenches to be done only by the WUC as opposed to the previous arrangement where customers were allowed to dig their own trenches. This arrangement makes water connection faster. In some instances, however, PrivateCos are engaged to dig trenches.

Shortage of fuel at the Goodhope station for use in both vehicles and borehole engines was said to be another issue of concern. It was established that the shortage of fuel was solely due to noneffective planning and procurement processes. The WUC Goodhope satellite station sources fuel from privately owned fuel stations competing for the product with the general public and private businesses. Moreover, the private fuel service stations in the area have low storage capacities; hence experience frequent shortage of fuel. The shortage of fuel for daily operations as a result impacts negatively on the performance of WUC in the area. The study further established that preference of private sector participation is overwhelming. Gathering from the responses, service contracts are the most preferred models of PPPs. Clearly, there is need to develop policies regarding contracting of PrivateCos. That the WUC is still experimenting with ways to contracting PrivateCos is evidence of lack of a model or policies that could otherwise protect the interest of the WUC. Some respondents were skeptical of the WUC's openness to open bids to companies throughout the country, thus denying local complies priority within the LMC. Preferential treatment is practiced widely where the market appears to be competitive and suffocating local businesses. The policies or model will also stipulate clear processes to be followed when contracting.

Lack of formal agreements such as "service level agreements" between the WUC and private parties impact negatively the operations and ultimately the performance. The supply and maintenance of power generators, for instance, was carried out under a "supply and payment" arrangement. Payments to suppliers are often delayed putting a strain on the relationship between the WUC and its suppliers.

## Suggested Model for Botswana Water Sector

This research is the first in Botswana to be conducted on the PPPs in the water sector. The research makes a number of contributions for scholars, executive management of organizations, and policy makers. The research revealed the feasibility of implementing PPPPs within a monopoly sector. It has been proved that PPPs can actually be implemented without necessarily changing or reversing this recent WSR. Second, the research weighted alternative PPP options against service contracts interrogating the practicability and the lack thereof, of implementing other PPPs options within a monopoly set up.

**Source:** Author.

Figure 2 depicts a conventional PPP arrangement. Under this arrangement, partnership between the government and a private party is located somewhat in the middle of the two entities. Often times, the arrangement leans toward the outsourcing option of privatization. To this end, a model suitable for Botswana waster sector was developed. The model is discussed below.

## Operations Support Contract (OSC) Conceptual Framework

The model suggested (see Fig. 3) is limited only to specific activities such as: new connections; inspection and replacement of meters; borehole fittings; connecting villages; replacing network pipes, constructing a new network; and construction of reservoirs. This model may not be used on

**Improving Water Service Delivery Through Public–Private Partnerships in Botswana: A Grounded Theory Approach, Fig. 2** Conventional PPP contract

**Improving Water Service Delivery Through Public–Private Partnerships in Botswana: A Grounded Theory Approach, Fig. 3** Operations support contract **(Source:** Author)

larger projects such as construction of dams, which are long term and hence may require more suitable models such as the BOT.

In the OSC, the relationship between the public and private entities is basically like that of an employer and employee providing the contracting party with more control over the contracted party and addressing all aspects that may lead to conflict or dispute. The OSC takes more meaningful cognisance of this relationship and argues that while both parties are in partnership, one has contracted the other. The model places more emphasis on the public getting the desired outcome and paying the right price. At the end of the day, one party pays the other for the provision on infrastructure or service.

The monopolistic nature of Botswana's water sector cancels prospects of competition at national level and has resulted in operational inefficiency due to the large-scale management of a service in

the entire country. The result is poor service delivery. In countries with similar arrangements however, such as the Republic of South Africa (RSA) (Falam 2005, p. 21), the United States of America (USA), Europe particularly France, and the United Kingdom (Neal et al. 1996) (Izaquire 1998, p. 1) where the population is higher, water is provided by several companies, which are in partnership with either Municipalities or a number of state-owned companies. In view of the foregoing, this research suggests a unique form of PPP, the OSC. Similar to the OSC are the two main forms of Service Contracts type of PPPs, namely, the Management Support Contract (MSC) and the Operations and Management (O&M) (Thoenen 2007).

By providing for contracting of private companies to perform a discreet function within the water sector, the OSC does not have any adverse impacts on the monopolistic nature of the water sector in Botswana. While the OSC provides its own unique feature, some features present in the MSC and O&M can be seen in the OSC. The combination of such features also addresses the shortcoming found where either model would have been applied exclusively. The OSC therefore has traits stated below.

### Management Responsibilities

The study has also revealed that the current contracting arrangement of private companies by the WUC does not provide for private management of the WUC assets. Among others, the WUC treats water as a security asset and has very little confidence in allowing the private sector to manage this commodity. The same can be said of dams, which store water. Similarly, under the OSC, the private party has no management responsibilities over public assets.

This is based mainly however on the premise that the nature of contracts is short term. Transferring management responsibilities to a private company will invoke residual implications to the relationship between the two parties such as commercial risks. In a conversional service contract, commercial risks lie with the Government (Asian Development Bank 2009, p. 28) and this is one of the traits that make this PPP option appealing. The transfer of assets from the WUC to private company and vice versa will also raise higher legal risks. Such transfers may therefore be cumbersome on the part of the WUC.

### Asset Ownership Responsibilities

Ownership of assets under this form of service contract remains that of the public sector. The private party may, under agreed terms, provide project vehicles to utilize in the project where the public sector is short of the transport. The provision of transport by a private company naturally eases the transport burden on the side of the government however; where the private company-provided vehicles are obsolete, there is a risk of poor performance but such risks can be controlled by including a performance-based payment (PBP) clause in the contract coupled with a strong monitoring mechanism.

Regarding infrastructure assets, ownership responsibilities remain those of the public sector. Ameyaw and Chan (2013, p. 161) confirm that this is because most assets are buried underground and this presents difficulties for private investors to obtain detailed information on the state of physical assets.

### Project Financing

The findings of the study reveal that private companies are awarded orders to complete a certain activity such as new connections. Subsequent to completion of the activity, companies invoice the WUC who in turn, processes the payment. Given the financial difficulties that governments have gone through in the past decade due to repeated market recessions, the OSC model provides for shared financing of a project with the private party recovering their initial capital at the end of the project. The private party basically provides the initial half on the budget and starts the project. This aspect of financing ensures that a contracted company is committed to the project as no company would invest its own capital in a project that would fail. By financing the initial half of the projects, a company is likely to demonstrate seriousness in implementing the project and avoid unnecessary losses.

During the mid-term review of the project, the public sector finances the remaining part of the project. This enables governments to begin sooner projects such as reduction of water leaks, which require immediate attention. The government of Botswana finances projects from its NDP, hence including a new project within an already running NDP remains a long and tedious process that also requires time.

### Payment Method

The payment mechanism of the OSC is based on use fee basis. Clear agreements are outlined in a contract to stipulate how the OSC contract will be designed.

### Contract Period

At present, the contract period for private companies is either tied to the magnitude of work given or agreed by both parties prior to the commencement of the project. Companies provide quotations as well as the estimated time of project implementation. The contract period for a standard OSC should range between 1 and 3 years. Although some of the service contracts as seen in West Africa (Marin et al. 2009, p. 49; World Bank 2009, p. 1) lasted for 7 years, the OSC provides for 3 years as maximum, based on that the projects to be undertaken under this model are for comparatively minor projects.

An additional reason for a 3-year maximum period is that contracts rely largely on availability of projects hence any period longer than 3 years may not be economically prudent to the public sector. The public sector may, in addition, not derive VFM. The model further takes into consideration political risks of possible change of governments. Most governments are in office on average for 5 years. The 5-year term allows the incumbent government to implement the OSC within one term. It is anticipated that the OSC will have a direct impact on various aspects of the WUC's daily operations. The following areas have been identified as having room for improvement if the model is adopted by the WUC.

### FuelSupply and Related Contractual Obligations

The WUC purchases fuel under different arrangements. These include purchasing through prepayments as well as in credit. Implementing the OSC in the procurement of fuel will fit the current arrangement as the model does not provide for the idea of signing medium to long-term contracts with any private parties.

### Billing

Billing is an equally significant component of water services as it provides revenue that enables the WUC to carry out its core mandate of providing water. The findings of the study revealed that contrary to reports from private media, tariffs have not yet been standardized. It has further been revealed that the outcry related to billing was in fact caused by most of the customers previously serviced but the DWA and Councils did not receive their bills regularly and as such, they now see the constant billing as a burden. The WUC, however, is progressively moving toward standardization of tariffs.

The implementation of the OSC will enable billing and may guide the WUC to contract private parties to deliver bills to individual households. The current contract that the WUC has with Botswana post includes payment of bills at the establishments of the latter and use of mailbox. Several companies are already providing door to door delivery services. Such services can relieve customers particularly in the villages where access to bills is problematic.

## Conclusion

Having experimented with various methods of privatization, countries have come to realize that PPPs provide a viable alternative through which services and infrastructure can be provided so as to meet the public need. Some countries have found the PPP arrangement realistic and practical as the private party may assume substantial financial, technical, and operational risk in design, financing, building, and operation of a project

allowing substantive Governments to focus on its core mandate of governance instead of dividing its attention to other functions.

This study highlighted the preference of private sector participation in certain areas of the economy. On the research's key findings and discussions, a trend has been established regarding the declining delivery of service in the provision of water and a rising dissatisfaction among the WUC clients. The results have also shown that much of the scarcity of water is a problem on its own, the WUC is using outdated administrative and business process. Given the foregoing, this study designed a model titled Operations Support Contracts using the grounded theory method. The model is firmly rooted on the study findings and stipulates its benefits of vis-à-vis the O&M or MSC versions of similar models such the Service Contracts model of PPP.

# Improvisation in Public Administration

Shrabanti Maity
Department of Economics with Rural Development, Vidyasagar University, Midnapore, Paschim Midnapore, India

## Synonyms

Moral-principles; Value-system

## Definition of PDS

"Public distribution system is a government-sponsored chain of shops entrusted with the work of distributing basic food and non-food commodities to the needy sections of the society at very cheap prices" (The Economic Times 2018, retrieve from: https://economictimes.indiatimes.com).

## Introduction

The most important requirement of the living organism for survivorship is "food." In fact, the specific goal of the "right to development" is the "right to be food secure." Food security cannot be achieved only by consuming enough food but only by consuming balanced food. The definition of "food security" was first instigated in the "World Food Conference" in 1974. In that definition, the emphasis was given on food supply. Then onward several attempts have been made to furnish a well-accepted definition of "food security." The worldwide accepted definition was given by the "Food and Agricultural Organization (FAO)." The FAO defined food security as "Food security exists when all people, at all times, have physical and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life" (World Food Summit 1996, retrieved from www.fao.org). This widely accepted definition discloses four pillars of food security, viz., *availability*, *access*, *food utilization*, and *stability*. In the developing countries, the buffer stock and the public distribution system (PDS) were introduced to ensure all dimensions of food security.

India is a dichotomous mixed economy where the coexistence of very rich, rich, poor, and very poor people can be seen. To ensure food security to the mass of poor and very poor population, the Government of India introduced PDS. The first PDS in India was introduced in 1947 under the Ministry of Consumer Affairs, Food and Public Distribution with the objective to give food and nonfood items at the subsidized rate to the poor. In the PDS, major commodities include staple food grains (mainly rice and wheat), sugar, and kerosene through a network of "Fair Price Shops

(FPSs)," commonly known as "Ration Shop." This PDS experienced several changes from its inception. The present PDS in India is launched on 10 September 2013, under the "National Food Security Act, 2013." The objective of the NFSA (2013) was "to provide for food and nutritional security in human life cycle approach, by ensuring access to adequate quantity of quality food at affordable prices to people to live a life with dignity" (NFSA 2013, retrieve from https://dfpd.nic.in/nfsa-act.htm). The act under "Targeted Public Distribution System (TPDS)" covers two-thirds of the population. The act enables each eligible person to receive 5 Kgs food grains (rice/wheat/coarse) per month at a subsidized rate (Rs. 3/2/1 per Kg). Side by side, the existing "Antyodaya Anna Yojana (AAY)," ensuring 35 kgs of food grains per household per month, continues to benefit the poorest of the poor. Special attention was given to the nutritional requirements of the pregnant women and lactating mothers during pregnancy and 6 months after the childbirth under NFSA (2013). The children up to age 14 years are also entitled to nutritional meals fulfilling the nutritional standard under this act. Most importantly, in the absence of supply of entitled food grains or meal, the beneficiaries are eligible to receive "food security allowance."

The PDS and food security in India are not new in literature. In spite of the extensive coverage of the PDS and its important role in ensuring food security, its relevance and effectiveness in improving food security have been questioned frequently in policy discourse on food transfers in India. In some studies, anomalies like inclusion and exclusion errors (Swaminathan and Misra 2001; Khera 2008), large-scale leakages (Sen 2011; Khera 2011) and so on related to PDS are highlighted. On the other hand, the role played by the PDS in improving food security was highlighted in few other studies (e.g., Dreze and Sen 1989; Sen 2011; Himanshu 2013a, b; Dreze and Khera 2013; Kumar et al. 2014).

Thus it will be prudent to examine the effectiveness of the present TPDS, implemented under the NFSA (2013), for a marginalized area of India. This motivated the current study. With the above-stated intention, the present study is conducted in the Barpeta district, Assam. The study mainly concentrates in investigating two objectives: firstly, to scrutinize the present food security scenario of the Barpeta district, Assam, by constructing self-developed multidimensional food security index especially in the "char" areas in relation to nearby areas other than "char" and, secondly, to assess the impact of the TPDS on the food security of the marginalized area, Barpeta district, Assam.

The novelty of this study is twofold. Firstly, this study is the first to examine the food security scenario of the study area by constructing a self-developed multidimensional food security index. Secondly, this study assesses the impact of the present TPDS on the food security of the study area.

## Concept

The Barpeta district is located in the lower Assam region of the Brahmaputra valley with a total geographical area of 2282 $Km^2$ (Census 2011). It is bounded by the foothill region of Bhutan and Baksa district in the north, Nalbari district in the east, Kamrup and Goalpara district in the south, and Bongaigaon District in the west (Economic survey of Assam 2013–2014).

Although the economy of the Barpeta district is agrarian in nature, unfortunately 33.3% people are engaged in agricultural activities as the landless laborer. Not only that the percentage of marginal farmers (marginal farmers are those whose average land holding size is less than 7.5 Bigha) in the district is 86.9, but also the average size of the landholding for the district is only 0.6 Bigha (HDR Survey, Assam 2013). The "poverty ratio" of the Barpeta district is 39.0%, compared to the all Assam figure 37.0% (HDR Survey, Assam 2013). Moreover, the condition is further worsened by the frequent occurring of floods and massive soil erosion by the river Brahmaputra and its tributaries. There are many "char" ("In the valleys, there are areas surrounded by the courses of the river Brahmaputra and its tributaries, known as the *chars*. These *chars* are, in fact, mid-channel bars, which are an integral part of the fluvial process of the river Brahmaputra and its

tributaries in Assam. They are extremely unstable and can be wiped out by erosion during recurrent floods. The *chars* are subject to erosion on their upstream and deposition on the downstream, due to which *char* dwellers migrate downstream. This affects the geometry and location of the chars during floods almost every year" (Directory of Char Areas (2007–2008; Government of Assam and HDR Survey, Assam 2013)) areas in the district within the river range of Brahmaputra, Beki, and Chaulkhwa. People living in these areas are often exposed to various water-borne diseases and famine (Economic survey of Assam 2013–2014). Most of the centrally launched safety net programs even do not reach to the poor people in these areas effectively. Due to a low level of income, especially in rural areas, people are unable to purchase adequate food for maintaining minimum nutritional standards. Under such circumstances, the public distribution system is expected to ensure food security by providing the necessary and adequate food items at subsidized prices.

This paper is organized so as to investigate each of these research objectives in turn. Section "Materials" enlists the data sources for this study. The methodologies are outlined in the section "Methods." The research objectives are investigated in section "Results and Discussion." Section "Conclusion" concludes the study and suggests the induced policy measures.

## Materials

The materials utilized for the purpose of this study and the collection procedure is presented in this section.

### Data

This study is based on both primary and secondary data. Secondary data are collected from the Department of Food and Public Distribution, Government of India, Directorate of Economics and Statistics, Government of Assam and Food and Agricultural Organization (FAO), Economic Survey of India, and Economic Survey of Assam.

### Sample Design

This paper is based primarily on a novel data set that has especially been collected to examine the food security status of the study area. The primary data used for the empirical analysis are collected through primary field survey following multistage random sampling with stratified and purposive sampling technique, covering the period from November 2014 to April 2015.

Thus, the primary data are collected just after the implementation of the "NFSA, 2013." There are 11 Community Development (CD) Blocks in Barpeta district. At the first stage, four CD blocks, namely, Chenga, Gumafulbari, Mandia, and Rupshi, are selected purposively with the criteria that these blocks contain both char and non-char villages. In the next stage, eight villages, namely, Roumaripathar, Kholabanda, 1 No. Alopati, Gueleza, Muchalman Gaon, Palhazi, Mandia Bardalani, and Ghugubari, are selected purposively from four sampled blocks. From each village, specific numbers of randomly selected sampled households including both PDS members and nonmembers are interviewed in the final stage. The sample size (household numbers both PDS member and nonmember) in both cases are determined by Krejcie and Morgan (1970) formula (Table 1).

In aggregate, 204 households, containing 85 PDS members and 119 nonmembers, are consulted for this study.

## Methods

The present section discusses the methods to address the said research objectives.

### Food Security Index: Determinants and Measurement

There are four important interlinked embedded in the FAO (1996) definition of "food security," viz., *availability*, *access*, *utilization of food*, and *sustainability over time.* Accordingly, factors like age, education of the house head, input availability, technology absorption, farm size (or size of the land operational holding), land quality, input price, and credit have been identified as the

**Improvisation in Public Administration, Table 1** Village wise population and sample

| Block | Villages | Population | PDS member | PDS nonmember | Sample | | Sample size |
|---|---|---|---|---|---|---|---|
| | | | | | PDS member | PDS nonmember | |

*C* char, *NC* non-char

determinants of the availability component of the household food security. The *access aspect* of food security can be proxied by the indicators, such as household annual income, household size, total earning members, composition of the family, etc. Finally, gender and expenditure on food and health are considered as the determination of the utilization aspect (Napoli et al. 2011; Abafita and Kim 2013). As food security is an unobservable complex concept, thus to capture the multiple dimensions based on the selected set of indicators, the present study uses PCA approach. The selections of these indicators are executed in such a way so that *at least one indicator* should be on the list to reflect *three major dimensions of food security*, viz., *availability*, *access*, and *utilization*. As the study is mainly based on *cross-sectional* household-level data, thus it is not possible to address *the stability and sustainability dimensions of food security*. Thus no indicator is included to capture *the stability and sustainability dimensions of food security.* The justification for selection of each variable is briefly explained in Table 2.

By applying PCA on the selected indicators, several components are obtained. The first principal component explains maximum variation followed by the second and so on (Abafita and Kim 2013). The HFSI can then be constructed by using the factor scores from the first principal component as weights. Again, since the different indicators used for the construction of HFSI are measured in *different metrics/units*, the *standardization transformation of each indicator* is performed so that each indicator has a zero mean and unit variance. This technique transforms each indicator as the unit-free pure number, and accordingly, by using the abovementioned weights, HFSI is generated as follows:

$$HFSI_j = \sum F_i \left( \frac{X_{ji} - \overline{X}_i}{S_i} \right) \quad (1)$$

where:

$HFSI_j$ = the food security index of the *j*th household obtained using PCA
$F_i$ = the weight of the *i*th variable in the PCA model
$X_{ji}$ = the value of the *i*th variable for the *j*th household
$\overline{X}_i$ = the mean of the *i*th variable over all the sample households
$S_i$ = the standard deviation of the *i*th variable over all the sample households

The index constructed above measures the food security status of one household relative to the other on a linear scale. The index so obtained may be positive or negative, which makes the comparison difficult. Therefore, a standardized index (SI) was developed, the value of which

**Improvisation in Public Administration, Table 2** Variables for construction of multidimensional food security index

| Variables | Description | Justification |
|---|---|---|
| Cattle owned | It includes the numbers of cows, buffaloes, goat, sheep, etc. | A large body of evidence suggest that dietary diversity is an important indicator of food security, reflecting the nutritional quality of food consumed (Smith and Subandoro 2007). Milk and milk products are one item of dietary diversity score, and thus we include this variable as a proxy for dietary diversity |
| Monthly consumption expenditure (other than rice and wheat) | It is the amount of money which the households have to spend for procuring various food items other than rice and wheat | This variable is included as an indicator of access to food |
| Poultry owned | This variable implies the numbers of cock, hens, and duck | One of the items for calculation of dietary diversity score is meat, poultry, and offal, and thus this variable is included as proxy for dietary diversity as well as access to food |
| Rice consumed | It implies the total quantity of rice consumed by the household | This variable is included as a an indicator of access to food |
| Wheat consumed | It implies the total quantity of wheat consumed by the household | This variable is included as an indicator of access to food |
| Land operational holding | It is the land ownership in bigha which is used for cultivation | In the rural areas, a household's access to food depends on availability of sufficient land and other productive resources to grow its own food. Thus, this variable is used as a proxy for access to food |
| Education of the house head | The total years of schooling of the house head of the sampled household | Sometimes it may not be the case that a particular food item is not accessible to a household, but because of lack of knowledge of the importance of dietary diversity, the household does not consume it, for example, fruits, vegetables, etc. The educational level of the house head helps in addressing dietary diversity, balance diet aspect, as well as water, sanitation, and hygiene issues |
| Toilet facility | Constructed latrine, 1; unconstructed latrine or no toilet, 0 | We include toilet facility by a household as an indicator of the sanitation and hygiene. The type of toilet facility indicates the level of hygiene and sanitary situation of the household and is associated with the status of health of its members. The health of the members is in turn associated with the ability of the household's members to make best nutritional utilization of the food consumption (Abafita and Kim 2014). Thus, this indicator is included to capture utilization and absorption aspect of food security |
| Source of drinking water | Public tap, 1; otherwise, 0 | Access to improve sources of water is also a crucial input for better health status of the household members. Hence, this indicator is also included to capture utilization and absorption aspect of food security (Abafita and Kim 2014) |

Source: Author's own specification

can range from 0 to 100 (for details check, "Mathematical Appendix").

The calculated *SHFSIs* are divided into two categories, PDS participants and PDS nonparticipants. Again, the mean values of the *SHFSI* for both groups represent the village-level standardized food security index (*VSFSI*), respectively. By considering weighted (weights are the number of sampled PDS member (or nonmember) households in the respective village) mean of the *VSFSI* block, food security index is constructed for the same two groups. The benchmark thresholds for these indices are developed on the basis of the FAO (2011) and presented in Table 11 in appendices.

### Impact Assessment of PDS: Propensity Score Matching

The outcome of the PDS participation is evaluated in terms of the FSI. The *impact assessment of the PDS is executed by using the propensity score matching* technique. The probability of participation or being treated (i.e., propensity score) can be estimated by using any discrete choice model such as logit or probit as they yield similar results (Caliendo and Kopeinig 2008). The present study uses the probit model.

Once the propensity score is estimated, different algorithms, viz., the nearest neighbor matching, Kernel matching (KM), etc., can be used in order to identify matching partners (Rubin 1974). The explanatory variables used for the probit regression are presented in the appendices (Table 12). The impact on outcome indicator is expressed as:

$$\Delta_K = K(Y^1) - K(Y^0) \tag{2}$$

where:

$K$ is the self-developed multidimensional food security index.

## Results and Discussion

The empirical results addressing *the objectives* of the study are discussed in the subsequent section.

### Performance of Public Distribution System in Barpeta District of Assam

For effective functioning of the PDS as a support system, it is important that major bottlenecks are properly identified and removed. A baseline survey of Barpeta district (Census 2011) had found that almost half of the households (51.1%) were BPL households. But the importance of the PDS is evident from the fact that about 89% of the households get essential commodities through the PDS, including the BPL households. The major problem with the PDS, however, is the inadequate supply of the essential commodities.

A perusal of Table 3 reveals that during 2011–2014, the number of the FPSs remained more or less stable, but the numbers of beneficiaries being served by them fluctuated. The table also divulges that mainly three food items, namely, rice, wheat, and sugar, were distributed until 2012, but unfortunately, sugar was dropped from the PDS distribution list from 2013 onward. The table clearly points out that there were

**Improvisation in Public Administration, Table 3** Numbers of fair price shops and the average number of population per FPS

| Year | Total number of FPSs | Number of PDS beneficiaries | Average monthly allocation | | | Average distributed by FPSs quantity | | |
|---|---|---|---|---|---|---|---|---|
| | | | Rice | Wheat | Sugar | Rice | Wheat | Sugar |
| 2011 | 1649 | 244,115 | 4960.46 | 87 | 789.9 | 4379.181 | 87 | 786.9 |
| 2012 | 1651 | 243,667 | 6141.875 | 151 | 786.9 | 5128.463 | 151 | 786.9 |
| 2013 | 1650 | 243,456 | 2743.884 | 210 | 0 | 2743.884 | 210 | 0 |
| 2014 | 1651 | 147,607 | 4155.96 | 138 | 0 | 4155.96 | 138 | 0 |

Source: Food, civil supplies, and consumers' affairs Barpeta (2015)

differences between the average monthly allocation of rice and its distribution through the FPSs in the district. However, the same table confirms that there was no leakage in the allocation and distribution of wheat. The distribution of rice sheds light on the large-scale leakages of PDS rice in the district. As it is the staple food of Assam and its district, thus, any diversion of rice from the PDS causes an adverse impact on the food security situation in the district as well as in Assam.

The said objectives are investigated one by one in the next section.

## Principal Component Analysis and Multidimensional Food Security Index

The food security index is constructed by using PCA technique. The compatibility and the robustness of the variables for PCA are tested by calculating descriptive statistics (5% trimmed mean, skewness and kurtosis, etc.) and by conducting Kaiser-Meyer-Olkin (KMO) and Tobias and Carlson (1969) of the listed variables, respectively. All results (Tables 13 and 14 in appendices) confirm the listed variables are compatible with PCA. The PCA results reveal that the first factor explained 43.7% of the total variation in the data, while the second factor explained another 15.5% of the total variation. The Catell's (1966) scree plot graphs the eigenvalue against the component number, and after examining the scree plot (Fig. 1), only one factor is extracted for analysis. The last column of Table 13 in appendices presents the factor loadings of the PCA.

By using these factor loadings as weights of the standardized variables (obtained by standardization transformation of the listed variables), the household-level food security index is constructed. On the basis of the constructed HFSI, the overall conclusion regarding the food security situation of the study area is drawn. Following the abovementioned methodology, the village- and block-level food security index for the said two groups separately are developed. The result is presented in Table 4.

The table reveals that category wise no significant differences have been marked by the food security index (FSI) between the PDS beneficiaries and non-beneficiaries in the case of sampled villages as well as for blocks, as all of them are identifies as "Critical." But the numerical figures recognize the actual role of PDS. The numerical value of FSI ensures PDS beneficiaries are in better food security status compared to non-beneficiaries. The next section extends the discussion of the food security scenario of the *char* and *non-char* areas for the said two areas on the basis of our constructed *VSFSI.*

## Food Security Index of Char and Non-char Areas of Barpeta District

This section focuses the effectiveness of the PDS in the char and non-char areas of the district in terms of the FSI of both the groups. The Table 5 depicts that for all *char* and *non-char* villages, participants' VSFSI is greater than that of non-participants. Again, the performance of the PDS for improving household food security status is better in *non-char* area than that of *char* area. This may because of the fact that the PDS in the *char* area is unable to operate in its optimum capacity because of frequent migration and illegal immigration.

In conclusion, the above result discloses that the PDS beneficiaries are in better food security status than that of the non-beneficiaries and the PDS operation is more effective in the *non-char* area compare to *char* area.

**Improvisation in Public Administration, Table 4** Block and village wise food security index

| Block name | Village name | Participants' FSI | | Nonparticipants' FSI | | Participants' food security level | | Nonparticipants' food security level | |

## Econometric Result: Propensity Score Matching

The sample size for the study is 204 households consisting of 119 numbers of nonparticipant and 85 numbers of participant household (Table 6). Here, the percentage of the participants is 41.09% and that of the nonparticipants is 58.91%.

The propensity score can be estimated by using any one of the binary-dependent variable models, viz., probit or logit model. The present study uses the probit model. The lists of the independent variable for the probit regression and their expected relation with the dichotomous-dependent variable are presented in Table 12 in the appendices. The regression result is presented in Table 7. The signs of the estimated coefficients are as expected. The PDS participation decision is positively influenced by age of house head and mean year of schooling, and the estimated coefficients are statistically significant at the different level. On the other hand, numbers of children in the family and monthly per capita consumption expenditures influence the PDS participation negatively, and both results are statistically significant at 1% level. The influence of the variables female-headed and SC/ST turns out to be insignificant. The log likelihood of the fitted model is (−) 110.992, and the models are well specified with high likelihood ratio Chi-square of 51.60 and pseudo R-squared coefficients of 0.489. The Chi-square test for the model shows statistical significance at the 1% level, indicating that the variables included in the model statistically explain the propensity scores used in the matching steps.

**Improvisation in Public Administration, Table 8** Estimation of probit for the whole sample: P-score

| Variable | Observation | Mean | Std. Dev. | Min | Max |
|---|---|---|---|---|---|
| P-score | 204 | 0.412 | 0.235 | 0.047 | 1 |

Source: Author's own calculation based on primary data

As it can be observed from Table 8, it appears that the probit regression estimates good predictors of participation in PDS. The estimated propensity scores range from a minimum of 0.047 to a maximum of 1.00 for both participants and nonparticipants. This means that the region of common support in this study is [0.047–1.000]. The mean propensity score for both the groups is estimated at 0.412. Therefore, the probability of participation in the treatment group is about 41% of all respondents. In other words, in 41% of cases, the probit regression model has predicted correctly the participation of all observation.

## Checking for Common Support, Balancing

It is mandatory to check the common support region. This is the region where the propensity score has a positive density for both participants (treated) and nonparticipants (non-treated). Figure 2 gives the frequency distribution of the propensity scores calculated by using probit model.

The propensity score ranges from 0.047 to 1.000 for both the groups. It can be seen from the figure that the common support condition is satisfied. There is substantial overlap in the distribution of the propensity scores of both treated and control group, and a severe common support problem does not exist between them.

Given that substantial overlap assumption of common support in the distribution is satisfied,

**Improvisation in Public Administration, Table 11** Threshold ranges of DDS, FSC and FSI

| Multidimensional food security index | |
|---|---|
| Food security score ranges | Food security groups |
| <65 | Critical |
| 65–75 | Low |
| 75.1–85 | Sufficient |
| >85 | High |

Source: Food and Agricultural Organization (2011)

the average treatment effect is restricted to the overlapping area whereby the nonparticipants are comparable with the participants based on their observed characteristics. The present study executes matching without replacement by using nearest-neighbor matching; therefore, 34 observations of the control case were discarded for making the comparison. Hence, 85 control observations were used to compare

**Improvisation in Public Administration, Table 12** Explanation of variables in probit model

| Variables | Description | Relation with dependent variable |
|---|---|---|
| Dependent variable | Dichotomous variable for participation in the PDS (1, participants; 0, nonparticipant) | – |
| **Independent variables** | | |
| Age of the house head | Age of the head of the household in number of years | Expected to be positive as with age house head may get many benefits from the PDS |
| Mean year of schooling | The sum total of schooling in completed years of all the family members divided by the number of family members | This variable is considered as proxy for knowledge. Thus, with knowledge household aware about the PDS benefits and may be interested to get that benefit. The variable is expected to influence the PDS participation decision positively |
| Number of children in the family | Number of children under the age of 14 years in the household | Expected to be negative on the PDS participation decision. As for children if they are enrolled in school, they will get more benefit from Mead-day-meal Programme. Moreover a family with more numbers of children indicates its acute backwardness under Indian circumstances and thereby is less aware of the government welfare programs, and also PDS is all available in same quantity to all children |
| Female headed | Categorical variable for (yes, 1; otherwise, 0) | Expected to be negative. As that household is expected to be socially deprived and likely to have lesser chance to be enrolled in the PDS |
| SC/ST | Categorical variable for (yes, 1; otherwise, 0) | Expected to be negative because of lack of information and likely to have lesser chance to be enrolled in the PDS |
| Monthly per capita consumption expenditure | Monthly household per capita consumption expenditure in rupees | Expected to be negative, because if the family can afford food grains at market price, they bother to collect it from PDS. Moreover these families will be denied to provide PDS card by the authority as they may belong to APL category |
| Monthly per capita consumption expenditure-squared | Generated variable | Depending on the significance of this estimated coefficient, we can get the idea that the specification of the regression equation should be nonlinear |

Source: Author's own specification

with the 85 treatment observations based on their nearest propensity score.

Finally, in order to ensure that the mean propensity score for the treated and control group is not different, the test for balancing covariates needs to be conducted. This is because the common support can be defined and used for matching only when the balancing property is satisfied. The test result on covariate balancing with mean and Pseudo-$R^2$ are presented in Table 15 in appendices. The table reveals that matching removes most of the existing bias for almost all covariates between the two groups.

The sensitivity between the treated and the control group is the next important issue to be checked. The output shows that significant positive treatment effects on the treated of 6.82 for FSI at the household level. Under the assumption of no hidden bias ($\Gamma = 1$), the Mantel (1963) bounds, $Q_{MH}$ test statistic gives a similar result, indicating a significant treatment effect (Table 16 **in appendices**).

## Estimation of Treatment Effect Checking of Sensitivity Between the Treated and the Control Group

The analysis of the treatment effect is conducted by focusing on two parameters, namely, the average treatment effect on the treated (ATT) and the average treatment effect (ATE). The results are presented in Table 9.

According to the estimated result, the calculated value of ATT for HFSI has increased by the amount 6.82, and the result is significant at 10% levels. The ATE, in this case, is 1.26. Thus, PDS plays a positive role in improving food security status to the participants of the study area. This result is consistent with the result of Tables 4 and 5.

The results related to two alternative matching algorithms, namely, nearest neighbor and Kernel matching, are presented in Table 10. Using these two matching algorithms, it is possible to evade any shortcoming that may arise simply by applying one single method and also helps to check the robustness of the estimated impacts on the outcomes.

The table divulges that the PDS plays a significant role in ensuring food security among participants in terms of HFSI, considering both matching algorithms. In fact, not only nearest-neighbor matching, the Kernel matching algorithm also ensures positive difference between PDS participants and nonparticipants in terms of HFSI (6.82 and 3.27, respectively). Thus, both matching algorithms ensure that PDS participants are relatively more food secure than their nonparticipant counterparts. In both cases, the results are statistically significant at different levels.

Hence, the study concludes that the PDS is contributing positively to ensuring food security, which is the main interest of this study. The result is quite obvious. As the PDS beneficiaries are able to get high-quality food grains, specifically rice, at the subsidized rate, they can utilize their saved fund either for purchasing of other food items or for maintaining the better living standard. On the contrary, the PDS non-beneficiaries are forced to purchase rice from the open market at a higher price, and maybe they are paying a higher price for inferior-quality rice. This adversely affects the non-beneficiaries food security status. If it is possible to resume the supply of sugar through PDS, then that will definitely helps in enhancing the food security status of the beneficiaries.

## Conclusion

The PDS is a system of distributing essential commodities universally to the citizens of the country, specifically to the vulnerable section of the society under the control of government department and agencies at an affordable price to protect them from the acute high prices in the market. From the above analyses, it is clear that the PDS proves to be efficient for Assam. To investigate the role of PDS, a marginalized district of Assam, viz., Barpeta, is considered. Barpeta district is mainly selected because there are *char* and *non-char* areas located side by side, which makes this district an ideal study area to investigate the role of PDS in improving food security even in the backward and the marginalized area in Assam, India. The study concludes that PDS operation helps in improving the food security status of the beneficiaries in both *char* and *non-char* areas. However, the role of PDS is more prominent in the *non-char* area than in the *char* area. The reason for such result has already been discussed in the earlier section.

Even after such important role, the operation of the PDS in this locality is not free from shortcomings. In fact, the same conclusion is very much valid for Assam as well. The coverage of the PDS needs to be expanded. Again, the items provided to the households were too limited to only PDS rice and wheat, whereas pulses which are much an important item often referred to poor man's protein are not included. Even the resume of supply of sugar and edible oil will definitely improve the role of PDS in ensuring food security regionally as well as universally. The grassroots survey ensures that the quantities distributed to the households were irregular and inadequate and the situation is not different in entire Assam. The respondents from the area also reported that the shopkeepers charged a higher price for the items than the prescribed price. Moreover, different prices were charged by different FPSs for the same items, across different places in the entire region of Assam. By observing the positive and significant role of PDS in ensuring food security among the beneficiaries, it is *highly recommended* that all the *shortcomings of the PDS should be removed.*

## Appendices

### Mathematical Appendix

Therefore, a standardized index (SI) was developed, the value of which can range from 0 to 100 (for details, check "Mathematical Appendix-2") using the formula:

$$SHFSI_j = \frac{NSHFSI_j - \mathrm{Min}\left(NSHFSI_j\right)}{\mathrm{Max}\left(NSHFSI_j\right) - \mathrm{Min}\left(NSHFSI_j\right)} * 100 \quad (3)$$

where:

$SHFSI_j$ = standardized food security index of the *ith* household

$NSHFSI_j$ = non-standardized food security index of the *ith* household

Given that the propensity score is a balancing score, it will produce valid matches which can be used to estimate the impact of PDS participation on the outcome indicators. This is done by matching the two groups of respondents on the basis of the predicted propensity score [*P(X)*] as follows: $Y^1$ is the outcome indicator for the PDS program participants ($D = 1$), and $Y^0$ is the outcome indicator for the nonparticipants ($D = 0$); then the mean impact is given as follows:

$$^{\mathrm{ATT}}\Delta_{\mathrm{PSM}} = E_{P(X)}\left(Y^1|X, D = 1\right) - E_{P(X)}\left(Y^0|X, D = 0\right) \quad (4)$$

where:

ATT represents the average treatment effect on the treated group.

The PSM estimator is the mean difference in the outcomes over common support, weighted by the propensity score distribution of participants.

# Incivility in Organizations: Perspective from Ghana

Frank L. K. Ohemeng[1] and
Veronica Adu-Brobbey[2]
[1]University of Ottawa, Ottawa, ON, Canada
[2]University of Education, Kumasi Campus, Kumasi, Ghana

## Synonyms

Bad manners; Boorishness; Discourtesy; Disrespect; Impoliteness; Rudeness; Ungraciousness

## Definitions

Workplace incivility, as mistreatment in social interaction, is characterized by rudeness, discourtesy, or displaying a lack of regard for others in the workplace.

Acting with disregard for others in the workplace, in violation of workplace norms for respect.

Low-intensity deviant (rude, discourteous) behavior with ambiguous intent to harm the target in violation of workplace norms for mutual respect.

## Introduction

Behaviors in the workplace are various and have varying consequences for individual employees and for the organization itself, including undermining organizational performance, interpersonal relations, and the sense of cooperation among employees. They are usually, however, within the constructs of the norms of the organization: these norms, which constitute aspects of nonmaterial culture, pertain to behaviors, languages, principles, and postulations that are expected to allow the workplace to be a suitable environment for individual and organizational performance. Every member is expected to exhibit behavior, the appropriateness of which is determined by the accepted language and principles, which normally have been established by management in order to achieve organizational objectives or else are part of the general legal framework for the working environment.

Unfortunately, sometimes employees behave contrarily to those established norms. Such behaviors have been described as incivility. Incivility, which involves acting with disregard for others and violation of workplace norms of respect, affects employees and organizational performance significantly, causing many to describe that workplace environment as toxic. To adequately deal with such behaviors, management needs to know how employees feel about them.

While some scholars have examined the impact of incivility on both individual and organizational performance, they have mostly focused more on the developed world, where formality is the norm; studies in developing countries, where informality permeates organizational life, are few. We agree with those scholars who say that context defined as situational factors in the external environment which act as stimuli to how individuals in organizations may behave matters in the discussion of incivility at the workplace.

The paper analyzes the problem of incivility and its impact on performance in some selected public and private organizations in Ghana from the perspective of some workers. The analysis shows that incivility has the same impact in Ghana as in developed countries, although what may be seen as incivility, as well as its magnitude, may differ according to the societal culture of the country. Incivility seriously affects individual and organizational performance. It undermines building cordial and workable employee relationships, has a detrimental psychological impact on such employees, and disturbs the concentration of victims, hindering the flow of effective communication. It was also found that employees are highly demoralized by such behaviors, leading to a high turnover in these organizations.

## The Idea of Incivility at the Workplace

Incivility is described as a form of CWB and as comprising behaviors counter to the established

norms or culture of the organization and that have been found to negatively affect employee performance. Andersson and Pearson (1999) have defined workplace incivility as "acting with disregard for others in the workplace, in violation of workplace norms for respect" (455), while Pearson et al. (2005) define it as "low-intensity deviant (rude, discourteous) behavior with ambiguous intent to harm the target in violation of workplace norms for mutual respect" (178).

A number of issues can be gleaned from the above definitions. First, incivility constitutes behaviors that violate important organizational norms and threaten the well-being of the organization, its members, or both. Second, it is low in intensity; it is thus not like aggression, which includes intense behaviors, such as verbal threats. Rather, it is limited to less severe actions, such as snubbing someone, or turning away when someone is speaking, with the intent to harm the target. From this perspective, it is seen as more of a verbal assault, in the form of disrespect, condescension, degradation, and so forth, all meant to hurt the target. It is distinct from workplace violence and is a low-intensity antisocial behavior, less intense for the fact that it is of lower magnitude in terms of force and with a lower obvious negative charge than other forms of aggression (Vickers 2008). Third, incivility is a behavior where the intent to harm is ambiguous to the target. Because it is of low intensity, it is often unclear whether the instigator's intent is malicious. The intention might not be explicit, but will cause harm nevertheless.

## Types of Incivility

There is no consensus among scholars, as to what types of behavior constitute incivility at the workplace. Hence, incivility may "take on a wide variety of nuanced behavior and can provide much discomfort and anxiety for those targeted" (Vickers 2008: 1637). Incivility thus includes ignoring or making demeaning comments about a target. Johnson and Indvik (2001) identified 11 of the most common uncivil behaviors: (a) condescending and demeaning comments, (b) overruling decisions without offering a reason, (c) disrupting meetings, (d) giving public reprimands, (e) talking about someone behind his or her back, (f) giving others the silent treatment, (g) ignoring people, (h) not giving credit where credit is due, (i) sexually harassing employees, (j) giving dirty looks or negative eye contact, and (k) insulting and yelling at others. Pearson et al. (2001) have highlighted five types of behavior as uncivil: (a) receiving a nasty or demeaning note, (b) being treated like a child, (c) being berated for actions in which one played no part, (d) being excluded from a meeting, and (e) having one's credibility undermined in front of others. Incivility may be subtler, and it is often prompted by thoughtlessness rather than actual malice.

In a recent review of the literature on incivility, Schilpzand et al. (2016) categorized uncivil behavior into experienced, witnessed, and instigated. They conceptualized experienced as those who are targets of uncivil or unacceptable behaviors as the workplace. Witnessed on the other hand focused on those who have not directly experienced uncivil behavior themselves but have witnessed such behaviors being directed to other persons, in particular colleagues. Instigated refers to perpetrators or participants in uncivil behavior. Such instigators display three main characteristics in their uncivil behavior towards others. These are attitudes and emotions, cognition, and personality. It is generally assumed that instigators are mostly people in a position of power over another, either organizationally or socially, or through influence, and who behaves uncivilly in order to either assert or preserve his power. This, however, is not only the case as colleagues at the office and at the same level of position of power can also instigate uncivil behavior towards other colleagues.

## Impact of Incivility at the Workplace

Scholars have concluded that incivility has far-reaching negative effects on both individual and organizational performance. Cortina et al. (2001) found that as personal encounters with incivility become more frequent, public employees'

feelings of general psychological distress, such as depression and anxiety, increase. Pearson et al. (2005) similarly found that more than 50% of the targets of incivility lose time worrying about the incident and about further contact with the instigator. They noted that more than 25% of targets waste time trying to avoid the instigator, while more than one-third of those surveyed indicated that they intentionally reduced their work efforts, discontinued tasks and activities beyond their job descriptions, and ceased voluntary efforts. Others said that they stopped helping newcomers, and others stopped offering assistance to colleagues. All of this adversely affected the performance and profit of the organization.

Incivility affects not only those targeted, but also those who witness it. In a study of the effect of witnessing incivility at the workplace, Porath and Erez (2009) observed that such witnesses may suffer emotionally, which will in turn affect their productivity and creativity. Totterdell et al. (2012) also found that witnessing staff incivility can be emotionally drained, especially when they take the perspective of the target and when they have witnessed interactions directly (first-hand) rather than indirectly (hearsay). They argued that such witnesses are more vulnerable to emotional depletion, as they experience an affective reaction, and regulate their own emotional response to what they have seen or heard (112). Porath (2012) says that such stress affects productivity in the sense that it disrupts memory and hinders information processing, as well as impeding problem solving, which leads to more superficial and simplistic thinking. Furthermore, employees under stress do not learn as well and tend to withdraw from their jobs psychologically and physically.

Some scholars see incivility as a form of discrimination at the workplace. Cortina (2008) is of the view that in some situations women and people of color are targeted more than men and whites. In another study, they found that gender and race, but not age, influenced vulnerability to uncivil treatment on the job, which in turn predicted intent to leave that job. They further argued that there is a correlation between target gender and race inasmuch, as that in these cases women of color undergo the worst treatment. Miner et al. (2012) also found a negative effect of gendered incivility on life satisfaction. Similarly, Marco et al. (2018) concluded that "workplace incivility toward LG employees [*is*] an expression of a subtle form of discrimination." Such discrimination leads to high stress levels, which impacts on targets performance and can lead to high turnover intentions.

Incivility leads to intense aggressive behaviors on the part of the targets, which may lead them to seek revenge in what has been described by Andersson and Pearson (1999) as "tit for tat" at the workplace. Rosen et al. (2016) in a recent study found that experiencing rude or uncivil behavior increased mental fatigue, which reduced employees' self-control and led them to act in a similarly uncivil manner later in the day. They noted that these "incivility spirals" occurred unintentionally and predominantly in workplaces that were perceived as "political," which was defined as an environment where workers do what is best for them and not best for the organization. Such tit-for-tat – or "incivility begetting incivility" – can create a chaotic and toxic workplace, reducing productivity. It may lead to "toxic workers," or "a worker that engages in behavior that is harmful to an organization, including either its property or people" (Housman and Minor 2015: 1), one who may not only endanger the workplace, but also generate enormous regulatory and legal fees and liabilities for the organization.

Incivility may lead to a high rate of absenteeism and a high turnover. Absenteeism is simply the failure to report for work as scheduled. It is believed that employees who engage in any form of withdrawal do so to protect themselves from the effects of uncivil behavior. These targets may contribute less to the organization by withdrawing from task forces, committees, efforts to generate or inspire innovation, and other workplace activities including social activities. It is believed that by doing so they are able to replenish their resources and improve their overall well-being. This is, however, not always the case as some may find the behavior so unbearable and may either ask for transfer, change departments, or

quit the job altogether. Consequently, organizations may be losing important personnel, which may impact on their overall performance.

Incivility can also have spillover effects. Spillover is the effects of work and family on one another that generate similarities between the two domains. Ferguson (2012) defines it as issues that arise outside the workplace – for example, marital issues at home – as a result of experiencing incivility within it (574). To her, "the stress resulting from incivility reaches beyond the workplace or incivility incident to permeate the target's life outside of work hours" (574). Incivility can have an effect on one's romantic relationship. Liang (2015) notes that incivility, which leads to emotional exhaustion, generates a negative strain in the home. The results of their study confirmed the correlation between emotional exhaustion and employee marital dissatisfaction or between work conflict and conflict in the home. Lim and Lee (2011) too found a positive relationship between incivility and conflict at home. They noted that workplace incivility leads to increased depression, anxiety, and work-to-family conflict for the incivility target. Such conflicts in turn affect the target's performance at the workplace.

## Addressing Workplace Incivility

Addressing incivility at the workplace falls at the doorstep of management. To this end, management must take proactive measures in ensuring a civil environment at the workplace. This can take many forms. First, management must institute as well as develop a culture of unacceptance of such behavior. In short, management must not tolerate any form of uncivil behavior in the organization. This should come in the form of a policy directive, which all organizational members must sign on to. Another way is instituting compulsory training about civil behavior to organizational members in general and in particular those who have been victims of incivility. The latter is of particular importance since it has been established that "being a victim of aggression is a possible antecedent to perpetrating workplace aggression" (Torkelson et al. 2016: 119). Dismissing or terminating employees' appointments may be another way to deter employees from engaging in incivility. If instigators of incivility are allowed to remain in the organization, perhaps after repeated warnings, it may serve as a tacit approval of such behaviors by management. However, if management terminates appointment of such instigators, it will serve as check on the behaviors of others, as it will show that management will not tolerate any form of aggression or uncivilized behaviors in the organization. Another preventive measure is creating an environment where reporting such behaviors to management becomes easy to victims.

## Incivility in the Ghanaian Workplace

The workplace environment in Ghana can be divided into public and private sectors, or the formal and informal economies. For clarity, we will use the terms public and private sectors. The public sector consists of two distinct types: government services and state-owned enterprises. The government services comprise the civil services and agencies as defined in the 1992 constitution. The commercial enterprises consist of a number of institutions, although their number is low compared to the 1960s and 1970s, as a result of the privatization of a number of them as part of a structural adjustment program that began in the early 1980s.

The private sector, on the other hand, constitutes everything outside the public sector. It can, however, be divided in turn into the formal and informal sectors. The formal sector here consists of high, private, commercial entities and constitutes a small part of this sector. The informal sector is made up of proprietary micro- and small-scaled enterprises. It consists of producers, wholesalers, retailers, and consumers. There are also intermediary service providers along the value chain, such as suppliers of raw materials to manufacturers on a contractual basis. Informal sector workers are largely self-employed persons, such as farmers, traders, food processors, artisans, and craft-workers, to mention but a few.

The public and private (formal) sectors and the informal private sector are that the former is subjected to regulations, and require explicit contracts between employers and employees. The informal private sector, which is dominated by individuals and small enterprises that employ apprentices, laborers, and domestic helpers or workers, on the other hand, is not subjected to government regulations. This sector employs nearly 90% of the working population. The main feature of the informal private sector is the predominance of self-employment, the pervasive use of apprenticeships in lieu of paid work, and excessively low wages. It is also here that there is a high level of incivility, with widespread violations of rights of workers.

Since the late 1950s the public and formal private sectors have been governed by the *Industrial Relations Act*, although there are other legislations, such as the *Public Service Commission Act*, the *Civil Service Act*, and the *Public Enterprise Act*, which determine how these institutions operate within the larger political context. The first *Industrial Relations Act* of modern Ghana was promulgated in 1958. The Act had some important elements. For instance, it gave legal backing to the Trade Union Congress as the sole labor center (i.e., the mouthpiece of workers) and made collective bargaining compulsory for both public and private (formal) sectors. Under the Act the employer and the union were both prevented from interfering in the affairs of the other. All these clauses were meant to ensure a conducive working environment. An important aspect of the Act that may be considered as dealing with incivility was Part V, which focused on unfair labor practices, and made it an offence for anyone to discriminate against employees. Actions that constitute incivility, as defined in the paper, were not addressed in the Act.

In 1965 a new *Industrial Relations Act* (Act 299) was promulgated. It became the main legal framework of industrial relations until it was repealed in 2003. It reaffirmed compulsory binding of CB for all workers, and provided for, and enumerated, grievance handling, conciliation, and arbitration procedures between employers and employees. Unfortunately, although the Act created an enabling working environment free from any form of antagonism between employers and employees and among employees, it again failed to address issues related to employer and employee behaviors. It thus failed to specifically address issues relating to incivility.

From 1966 until the repeal of the 1965 Act and the promulgation of the new Industrial Relations Act, government various institutions to ensure a good working environment for Ghanaians. For instance, the National Liberation Council (1996–1969) government passed the *Labour Decree, 1967* (NLCD 157) to govern some aspects of labor relations in the country, including employment contracts, conditions of employment, the rights and obligations of the parties, conditions for termination of contract, provisions relating to severance pay, employment of females, children and young persons, protection of remuneration, forced and communal labor, reporting of deaths and injuries, improper taking of presents, and powers of the Labour officers. It also established a Commissioner of Labour to deal with issues from the decree.

In 1971, the Progress Party government (1969–1972), as a result of its conflict with the TUC, amended the *Industrial Relations Act 1965*, with the *Industrial Relations (Amendment) Act* (*Act 383*), as well as passed the *Factories, Offices and Shops Act, 1970*, (Act 328), with the aim of attaining internationally accepted standards for the safety, health, and welfare of persons employed in factories so as to reduce the risk of injury and protect the health of all persons employed in all premises covered by the Act. Similarly, the period between 1972 and 1981 did not see any attempt on the part of government in addressing incivility. In all government did not attempt to address issues related to incivility and other CWBs.

The brevity of successive governments precluded meaningfully attending to labor issues until the emergence of the Provision National Defence Council (PNDC) on December 31, 1981. In 1983 the PNDC embarked on a structural adjustment program, with serious consequences for how the working environment was governed. It passed, for instance, the PNDCL 66 to ensure

industrial safety, health, and welfare of factory workers and covered such issues as cleanliness, overcrowding, ventilation, lighting, protective clothing and appliances, and lifting of excessive weights. It included notification of accidents and dangerous occurrences, fires and explosions, training and supervision of inexperienced workers, facilities for sitting, and gassing and suffocation. It also passed the *Workmen's Compensation Law, 1987*, compensating employees injured on the job and the families of those killed. Again, not much was done about incivility.

In 1993 the PNDC was replaced by the National Democratic Congress, under the 1992 republican constitution. The *Constitution (Amendment) Act 1996* stipulates the rights of workers. Section 24 lists economic rights, including the rights to work in satisfactory, safe, and healthy conditions and to receive equal pay for equal work, while subsection (2) looked at matters like rest, leisure, reasonable limitation of working hours, and holidays with pay, as well as remuneration for public holidays. Although the constitution was clear about discrimination at the job place, the onus was still on the government to produce legislation dealing with the public service in general and the civil service. The government consequently passed both the *Public Service Commission Act* and the *Civil Service Act* in 1994. While these two Acts (and especially the latter) talked about ethical issues in the performance of public and civil servants, they were silent on incivility in general, except for the statement that the workplace should be an environment where all workers can work to the best of their ability.

In 2001 the NDC was replaced by the New Patriotic Party and in 2003, the government passed the *Labour Act (Act 651)*, repealing the *Industrial Relations Act (1965)*, as well as other decrees governing the working environment. Part III of the Act is of importance here, as it discusses legal provisions for the protection of employment, including the rights and duties of both the employer and the employee. In addition, it focuses on working under satisfactory, safe, and healthy conditions, etc., at the workplace. In this case, incivility can occur both in the actual work setting and outside it. A caveat is that employees must be involved in work-related activity. In addition to this, and for the first time, the Act introduced the subject of sexual harassment, calling it an offence at the workplace.

## The Impact of Incivility on Individual and Organizational Performance

Drawing on some interviews, and with reference to the factors identified in the literature review, in particular the types of incivility, we will examine its different forms and their impact on performance in Ghana. Respondents identified a number of issues: absenteeism, abuse, sexual harassment, interpersonal relationships, and uncivilized attitudes of co-workers, related to incivility. In what follows we will discuss these, with explanations and quotations from interviewees. Before we do so, however, it is important to emphasize that although respondents varied in their perceptions of incivility, they unanimously believe that incivility is an act contrary to the norms and work ethics of an organization and constitutes behavior against moral and societal norms. Most of them saw incivility as meaning a disrespectful or rude attitude and remarks from one employee to another at the workplace. They further agreed that incivility is a nonconformity behavior in the context of the social or moral standards of the organization. A few considered it to be simply an impolite attitude to others or making rude or impolite remarks about someone to another person. The responses identified the following acts as the most common uncivilized behaviors at the workplace: insulting, snubbing, shouting at others, making cheeky comments, gossiping, looking meanly at others, not greeting colleagues, banging doors on others, use of abusive language, and deliberately ignoring someone.

Almost all interviewees agreed that incivility negatively impacts work and performance. They suggested that incivility affects the culture, performance, and productivity of the organization. For instance, a respondent related an incident with his supervisor that gravely affected him. The interviewee noted:

> My supervisor gave me some work to do, but because of her handwriting, I couldn't read [it] clearly. I made some mistakes in carrying out the job. The supervisor, upon realizing the errors in the work I presented, called me, and told me, "W'abon" ("You're an idiot"). I was so hurt and offended that I did not respond to her greetings the following day. That remark was rude and discourteous. After all, we all make mistakes.

Incivility in the workplace undermines employees psychologically, destroys relationships and victims' concentration, and impedes communication. Employees are demoralized by rude and disrespectful comments by their superiors and others. It erodes their mood and their enthusiasm for work. A respondent described how a colleague insulted her so much that she became so disturbed she could not continue her work that day: "I was really pissed off by her behaviour, so much so that I couldn't continue working, and had to postpone the work to the following day," she said.

## Incivility and Absenteeism

Another important factor identified in the literature is the relationship between incivility and absenteeism. We found the correlation, in the sense of the effect on individuals and organizational performance, to be very strong, as a result of the emphasis on this by respondents. A number of interviewees indicated that after they had experienced incivility, their urge to report to work the following day was diminished dramatically. Some admitted that they had refused to turn up at all as a way of dealing with the stigma inflicted by the incivility. Others used the time to "cool off" and overcome the impulse to retaliate, especially where the instigator's status as a colleague made the latter possibility more likely. One interviewee remarked that staying at home allowed him to ponder the incident and to reflect on what he might have done to de-escalate the situation. Others expressed the view that they became irregular or unpunctual at work, while a few said that after the incivility, they took "French leave." Some noted that people who have had the experience tend to "leave work without permission" – which, although against the rules, is understandable in view of the associated trauma.

When asked about the effect of absenteeism on performance, respondents identified several. Some, for instance, noted that absenteeism causes delays, interrupts workflow, and, in some cases, produces shoddy work. This is particularly the case in construction and factory settings. One interviewee asserted that in their organization individuals in the same departments work in teams to achieve production goals. Work is scheduled at particular times to enhance the smooth and effective flow of operational activities in order to achieve set production and performance targets and meet customer needs. In the event of a worker absenting him or herself from work, the interviewee continued, the flow of events is disrupted. That person's part of the work goes undone, undermining the entire flow. This, in turn, results in missed deadlines. Another explained that in situations where those present team members can perform the task of the absent one, it puts undue pressure and hardship on those at their posts. Some interviewees were concerned that absenteeism slows down productivity, especially when the work to be performed by the absentee requires special skills. An interviewee who had experienced incivility from his supervisor claimed that he had absented himself for a couple of days as an act of deliberate retaliation, to sabotage performance and productivity. He did this, he said, because numerous complaints to management about the attitude of the supervisor in question had gone unheeded.

## Incivility and Interpersonal Relationships

One of the issues that interviewees felt important when it comes to incivility is the deterioration of interpersonal relationships. An interpersonal relationship has been defined as "an individual's subjective experience of repeated interaction or connection with another individual" (Reich and Hershcovis 2015: 224) and has a number of benefits to both individuals and organizations have also been amply examined in the literature.

Our respondents expressed serious concerns about the negative impact of incivility on personal relationships at the workplace. They were of the view that the Ghanaian culture's promotion of a communal spirit, as well as teaching that "each is his or her brother's or sister's keeper," and which normally applies also in the workplace, means they expect such places to be uncontaminated by incivility, because it is, simply, non-Ghanaian. They expressed concern that incivility, nevertheless, continues to destroy such personal relationships. One interviewee, for example, strongly condemned the attitude of supervisors in her organization. She noted "that the relationship between supervisors and subordinates is nothing to write home about, and this relationship is destroying the cordiality that existed in the organization." Most of the interviewees were sure that some supervisors do not respect their subordinates and thus "talk to them anyhow." Such behavior, these interviewees contended, affects employees psychologically to the extent that some of them exhibit such negative behaviors as slowing down work intentionally as a way of "paying back" such supervisors. They thus confirmed the assertion that when the worker feels that his boss sees him only as an instrument of production or merely a cog in a machine, he is likely to perform poorly.

Another shared an experience that affected her relationship with a colleague.

> I entered an office of a colleague for an important document to work with. The colleague was on the phone conversing for almost an hour about an unofficial duty, ignoring my presence in her office. I deduced she was in a conversation with a friend. I got upset, and left the office. I had to stay in my office waiting for her to finish her conversation before I could work. This lady stayed on the phone close to an hour and a half. Is that how we behave at the workplace?

The respondent went on to explain that since this incident her attitude towards her colleague had changed dramatically, as what the colleague did was not respectful towards her. According to her, she became so furious that she could not do anything, and had to postpone that day's work until the next, which meant the loss of productive time for the organization. She then rhetorically concluded that such behaviors do not promote or build cordial and workable employee relationships at the workplace and do not augur well for any organization's success.

## Sexual Harassment as Incivility

One of the most interesting factors in the discussion of incivility at the workplace is sexual harassment, defined as "unwanted sexually offensive behaviour that threatens one's psychological health and well-being" (Nydegger et al. 2006: 55). Sexual harassment may take any of three forms. First is gender harassment, which comprises a range of verbal and nonverbal behaviors generally not aimed at sexual cooperation but, rather, convey insulting, hostile, or degrading attitudes toward women. Second is unwanted sexual attention, which is about both verbal and nonverbal behavior: from repeated, nonreciprocal requests for dates, intrusive letters, and phone calls; touching, grabbing, and cornering; and gross sexual imposition or assault. Third is sexual coercion, which consists of bribes and threats, whether explicit or subtle, in the sense of offering some job-related benefits on the condition of sexual cooperation. This is about the making of "job conditions contingent on sexual behavior" (Lim and Cortina 2005).

One of the key issues seriously raised by our respondents was sexual harassment. In the Ghanaian case, it is more about the second and third types of sexual harassment and mostly manifests itself in the context of hierarchical authority and power. Three different perspectives on sexual harassment were unearthed from our interviews. First, some respondents described sexual harassment as "enticing somebody to have an intimate affair or relationship with an employee." Second, others said that it is about looking at or commenting on any part of the body, which the victim may interpret as offensive: for instance, looking at a female intensely or closely. The third perspective is about imposing one's interest on the same or opposite sex for sexual favors. The majority of respondents, however, did not perceive the simple holding of hands or putting hands around necks and waists as sexual harassment, although there

was almost unanimous agreement that kissing, touching of breasts and buttocks, holding someone very tight, and asking for sexual favors are inappropriate and, thus, constitute sexual.

Almost all the respondents agreed that sexual harassment mostly happens to female employees. They asserted that sexual pressures usually come from male bosses, who demand sexual favors from female subordinates. On this subject, a respondent who had experienced sexual harassment noted: I was in the office one day when my boss came from behind and kissed me. When I asked him why he did that, he only replied, "I do not care what happens." Another averred "my boss pushed me to the wall and asked me to have sex with him in his office. I declined vehemently, but had no avenue to report the incident."

A number of respondents were of the view that some superiors take advantage of the high rate of unemployment to demand sexual favors from subordinates, especially female national service personnel, who are in these organizations temporarily. Failure to give in to a superior's request may affect one's promotions, recognitions, and other benefits. Interviewees were unanimous when the question of the impact of SH was put to them: it affects victims psychologically to the point that many become timid and emotionally disturbed. Many lose concentration at the workplace and feel insecure. One victim indicated that "any time I'm alone with my boss (the perpetrator) in the office, I make numerous typographical mistakes when typing because I fear he will repeat what he did to me", while another confessed that she "shivers and drops whatever I might be holding whenever I meet the person who harassed me."

Sexual harassment can also lead to employee turnover, which then affects the productivity and performance of the organization. Some respondents confirmed that some of their colleagues resigned after their bosses sexually harassed them. One respondent, who has changed her job, noted that before she left she never felt happy going to work and indicated how the experienced affected her personality and performance, as a result of losing her confidence and enthusiasm to work. A worried worker does not produce the best results. An individual who is sexually harassed at his or her workplace may want to quickly find a new job to avoid recurrences. The implication is that the organization may lose qualified, skilled, and committed employees if such behavior is not curbed.

## Abusive Supervision as a Factor of Incivility

One issue that respondents raised was abusive supervision. Tepper (2000) defines the term as "subordinates' perceptions of the extent to which their supervisors engage in the sustained display of hostile verbal and nonverbal behaviors, excluding physical contact" (178). Tepper (2000) has identified a number of problems, or what he called "dysfunctional consequences," associated with abusive supervision. These include: the likelihood of subordinates to quit their jobs, lower job and life satisfaction, lower normative and affective commitment, and higher continuance commitment, conflict between work and family, and psychological distress (186). Abusive supervision seriously affects subordinates emotionally and psychologically. It breeds low self-esteem, timidity, and a negative attitude towards work, because the victim is undermined psychologically.

Our respondents perceived abusive supervision as the use of an office or position of authority to infringe on the rights of subordinates by treating them with contempt. This is consistent with the idea of "generalized hierarchical abuse," which is "the experience of having been mistreated by superiors in general, as opposed to one supervisor in particular" (Tepper 2007: 265). Interviewees see this as superiors misusing their authority to intimidate, or maltreat, or harm subordinates and gave instances of abusive supervision, as when superiors shout, insult, scold, or talk harshly or rudely to a subordinate because of the position they occupy or the authority they have. Others added bosses extending the working hours of subordinates without compensation; delaying the provision of resources for the work to be done; increasing the work load of other employees by adding their (the bosses') duties or other colleagues' duties while the actual job holders idle around; and

giving falsified reports on the capability of subordinates.

When the question of the effect on them was put to interviewees, both those who have experienced and those who have witnessed such abuse agreed that it has had an impact on their performance or on the performance of those they have witnessed being subjected to the abuse. A female respondent noted how she became very emotional, unstable, and afraid whenever her boss was around because of verbal abuse she gets from her. She complained that she lost concentration and became jittery, which affected her performance. She claimed that lost weight within weeks and thought of quitting the job, but rescinded that decision because she is a widow and taking care of three children. She therefore mustered courage, reported her to management, and asked for a change of supervisor, which was granted. A male respondent described how his boss abused him by making him work outside working hours without any form of compensation and decided no longer to perform any job he assigns him, as well as join him for extra work as he used to. He went on to state that "if this is what my boss is doing, what prevents me from doing the same when I become like him? I'll also find ways and means to benefit from all the work I am doing for him. I said ways and means: for example, I can say I am sick and not report to work, but find something else to do. If he is not recognizing my effort, I will also 'show' (retaliate in other forms against) him."

## Uncivilized Attitudes of Co-workers

We have already noted that incivility emanates not only from supervisors, but also from co-workers. We asked our respondents for their experience(s) of co-worker abuse. One interviewee said her relationship with a colleague had ended because of their verbal abuse of a third colleague. She noted: "the cordial relationship I had with her (the instigator) ceased, as I found her behaviour to be disrespectful. I found it difficult working with her in a cooperative manner." Another respondent talked about how he had had to postpone work he had been doing because of the attitude of a colleague. That person, he maintained, repeatedly refused to heed his request for materials that would have enabled him to complete his work. Employees are extremely demoralized by rude and disrespectful comments made by their colleagues.

## Conclusion

The past few years have seen reports of the rise of incivility at the workplace in both developed and developing countries. This study has explored the issue of incivility its impact at the workplace in Ghana, as a result of the continuous reports of uncivilized behavior in both the electronic and print media.

Examining the issue in some purposively selected organizations in the Kumasi Metropolitan Area, we identified the most common forms of incivility, such as sexual harassment, co-worker problems, absenteeism, the deterioration of interpersonal relationships, and abusive supervision at the workplace. These issues are indeed found in the developed world. It was discovered that such uncivilized behaviors significantly affect both individual and organizational performance. Overall, workplace incivility has the potential to "chill" an organization's human environment, further evidence for workplace incivility's deleterious effect on organizational climate.

It was nevertheless realized that apart from widespread agreement that such behaviors are unacceptable, there is no legal framework for dealing with the issue in either the formal or the informal sectors in the Ghanaian economy. This agreement is rather based on what societal cultural norms consider right and wrong. Consequently, we would have expected the *Industrial Relations Act (2003)* to have covered it. It does not. Hence, unlike in the developed world, the targets of such behaviors find it difficult to, for example, seek redress in the courts. Overall it can be said that incivility is extremely costly to organizations in Ghana, as it destroys creativity, performance, and team spirit, as well as having damaging repercussions for customers and citizens. We therefore expect government to start addressing these issues, which are on the rise.

## Definition

Discussing a shift in emergency management to ensure that all residents of an area are considered

during planning and included in response and recovery activities.

## Introduction

The concept of "inclusive emergency management" has been evolving in the United States and today is still a work in progress. It ranges in the way it is applied from region to region, state to state, and even at many different local levels. Much of the variance, it seems, is a result of the level of awareness by the lead governing authority, and even where in the organizational structure, the Office of Emergency Management sits within a jurisdiction. Ultimately there have emerged several factors that need to exist to enable the maximum benefit of the inclusive approach. These include, as mentioned, the political awareness to support it, the commitment of resources and funds, and ultimately the participation as active partners from stakeholders in the community.

## Background

Time and time again in disaster, a community's most vulnerable members bear a disproportionate burden and experience unequal adverse outcomes over a longer period of recovery time. This is true whether the disaster is natural, man-made, or technological. It is true just as true in earthquakes as in conditions of civil unrest.

In the United States, Superstorm Sandy in 2012 left many people with mobility limitations stranded on the upper levels of New York City high-rise buildings when either they decided not to evacuate when told to and ride out the storm or could not find the support to leave in time. The storm brought devastation to swaths of the NE, but it was people in public housing whose power was the last to be reconnected and services reestablished.

In 2004, Hurricane Katrina, also in the United States, those who died were overwhelmingly older adults. In a survey of individuals who did not evacuate New Orleans prior to the storm, 14% of respondents had a physical disability, 23% stayed behind to help someone with a physical disability, and 25% had a chronic illness.

In disasters we observe that people with disabilities and others with access and functional needs are especially vulnerable. In the United States, a person with a disability is defined by the Americans with Disabilities Act as:

> Someone who has a physical or mental impairment that substantially limits one or more major life activities, a person who has a history or record of such an impairment, or a person who is perceived by others as having such an impairment.

This definition of disability is traditionally narrowly interpreted and largely does not include many of the people who experience poor outcomes in disaster due, in whole or in part or in combination, to lack of access to preparedness or response information, funds, personal networks, age, and language, among other response and resilience strategies.

Social vulnerability research by Quarantelli, Cutter, and others finds that there are social and societal features that increase an individual's risk and vulnerability to disaster. The social vulnerability theories were further expanded and built upon to develop the access and functional needs framework and eventually the whole community approach to emergency management.

## Access and Functional Needs Framework in the United States

This current best practice in emergency management attempts to classify vulnerability not by an individual's demographic or social features but rather the functions one must complete in order to remain safe and stable during and after a disaster. Rather than simply asking who is vulnerable, a functions-based approach asks what makes someone vulnerable. For example, two different older adults may have heightened vulnerability – one because she has vision loss and the other because he is on dialysis. It is not simply being an older adult that makes them vulnerable; rather, their functional limitations related to receiving public

information (in one case) and requiring medical support (in the other case) make them vulnerable.

This access and functional needs framework identifies the following functional areas:

**Communications**: refers to the ability to access and understand disaster-related messages. This may be people with hearing or sight limitations or people who can only understand a language other than languages that governments and responders communicate in. If these people do not have access to media or social media, they may not be aware of the situation or what recommendations are being made by local responders.

**Medical needs**: includes people who are electrically dependent, are unstable, are terminal, or have contagious health conditions that require observation, active management, and ongoing treatment, including intravenous therapy, tube feeding, vital signs reading, dialysis, oxygen and suction, catheters, ostomies, and wound management.

**Maintaining independence**: encompasses supplying or replacing those supports – such as consumable medical supplies, durable medical equipment, service animals, or attendants or caregivers – that enable individuals to maintain their independence and perform activities of daily living and return to or maintain pre-disaster level of independence. It is preferable to provide a person with limited assistance if by doing so, the person does not have to be placed in a higher level of supervision and care.

**Support, services, and self-determination**: includes those who require support or supervision from others to assess situations, react appropriately, and take required self-protective actions, e.g., young children and individuals with dementia, psychiatric conditions, and/or cognitive/intellectual disabilities.

**Transportation**: refers to the ability to travel from one place to another safely – not only related to evacuation but also encompassing obtaining supplies required to safely shelter in place, reentry, and recovery. Many times this involves people without independent transportation resources or who rely on public transportation.

These functions characterize the actions or tasks that a person must take to mitigate against negative disaster impacts. This functions-based approach considers what an individual can do rather than a perceived vulnerability based on a diagnostic category or population characteristic.

This approach attempts to reduce generalization and stigmatization of population groups and provide emergency managers with clearer, more actionable information about who may need help and what type. Using a functions-based perspective clearly delineates areas where intervention can reduce disaster vulnerability and risk to the whole community. In addition, this change in approach supports an integrated planning process for the whole community, as opposed to setting aside a portion of the community as "special" or "vulnerable."

## Whole Community Framework in the United States

The Federal Emergency Management Agency's (FEMA) whole community framework emphasizes the value in understanding and meeting the needs of the whole community, including those with disabilities and others with access and functional needs, engaging and empowering all parts of the community, and strengthening what works well in communities.

A whole community perspective builds on the access and functional needs approach by identifying common functions that a jurisdiction should perform during emergencies to meet the needs of its whole population. For example, evacuation plans developed using a functions-based using whole community approach take into necessary accommodations for those without personal cars or access to public transit, individuals who use wheelchairs and other mobility devices, and other functional-based barriers to safe and swift transportation during an evacuation. In doing so, these plans meet the transportation and evacuation needs of all members of the community.

## Inclusive Emergency Management Framework

Combining a functions-based framework and a whole community focus has led US practitioners to identify an Inclusive Emergency Management Framework. Borrowing the long-standing mantra from the Disability Rights Movement, "nothing about us without us," points to the idea even within the field of emergency management that no policy should be decided or plan developed without the full and direct participation of members of the groups that the policy will impact. The result of this evolution in approach translates to incorporating individuals with disabilities and others with access and functional needs into all phases of emergency management.

Inclusive Emergency Management is a resource-intensive process but yields emergency management programs that are more equitable and effective at meeting the needs of the whole community. Jurisdictions across the United States have implemented various approached to inclusive emergency management.

In the early 1990s, the New York City Mayor's Office of Emergency Management (rebranded in 2015 to NYC Emergency Management) created a full-time Special Needs Advisor position responsible to oversee all aspect of disability, age, and medically managed issues as they pertained to the practice of emergency management. In addition to the Special Needs Advisor, the office initiated a multidisciplinary task force and sought public participation in planning efforts. Growing out of those earlier iterations, a similar role, often called the Access and Functional Needs Coordinator, is now often found within local, state, regional, and federal emergency management programs.

For example, the Orange County California Sherriff's Department Emergency Management Division has tasked a staff Disabilities and Access and Functional Needs Coordinator and convenes a regular working group. This group includes members from the whole community, including individuals with disabilities and representatives from organizations that provide services to and/or advocate on their behalf. This workgroup collaborates on policy drafting, program development, and emergency operations plan review. Their contribution is valued and incorporated into end products.

The City of Portland, Oregon, the Community Engagement Liaisons (CEL) program identifies civic-minded individuals from underserved and vulnerable neighborhoods or communities and provides them with training in collaboration and advocacy. Once trained the Community Engagement Liaisons apply their culturally specific knowledge to city programs and products to help planners determine if they are appropriate and equitable. They are also available to help city programs with culturally appropriate interpretation and facilitation services. This program has been recognized as a national best practice by Harvard's Kennedy School of Government Ash Center for Democratic Governance and Innovation.

Similar titled positions and workgroup approaches are found all across the United States today from New England to the South and over to the West in places such as New Jersey, Florida, Texas, and California. Not all are structured in the same way or receive funding from the same sources. Some have been codified in local administrative or executive code, while others are more ad hoc. In Los Angeles County, California, for example, the AFN Committee made up of government and nongovernment representatives is now a required stop along the approval process for all emergency plans before they can be adopted.

The most successful among the range that exist do more than host information sessions in the community but involve the community voice in planning, exercises, and revision processes.

## Seeking Equity: The Next Natural Progression

US emergency management has historically sought to deliver the greatest good for the greatest number. We observe in the aftermath of disaster after disaster that while beneficial, these broadly directed interventions and strategies marginalize and add additional harm to individuals in our

communities with the least resources and capacity. Public services, including emergency management, should seek to be delivered equitably to the whole community. Service and support delivery should be designed to reach the most vulnerable and, in doing so, will also be accessible by those with more means (whether it is social, financial, health, or other means).

As emergency management programs have sought to better understand and meet the needs of the whole community, including society's most vulnerable, they have increased accessibility and parity. They have more meaningfully engaged the whole community and are better able to clarify needs of their community members, calculate appropriate interventions, and identify associate assets in anticipation of disasters. Yet we are far from equity, as evidenced by the excess disaster-related morbidity and mortality for people of color, people living in poverty, people with disabilities, and others lacking the access or functional capacity to stay safe and healthy in disaster. Engaging the whole community and creating Access and Functional Needs Coordinator positions are reducing risk and enhancing resilience, but they have not achieved equity. Additional work, tools, and capacity are required to facilitate equity in emergency management.

## Introduction

As population density rises in urban areas worldwide, it is important to recognize the increasing

challenges of particularly vulnerable communities. By addressing the strengths as well as the challenges of marginalized groups, public administrators can become acutely aware of deeply rooted inequities and needs within subpopulations of vulnerable citizens (Ecker J, Aubry T, Sylvestre J 2019). One often overlooked subpopulation, which warrants administrator attention is the older adult population within the lesbian, gay, bisexual, transgender, queer/question (LGBTQ) community. While academic research, such as that conducted by Ecker et al. regarding the prevalence of homelessness within the LGBTQ adult population, has identified the risk factors faced by LGBTQ seniors, strategies for equitably addressing the needs of this vulnerable subsection of the elder community is under-researched in the field of public administration. There is, however, an extensive amount of research conducted by leading practitioners in the field, most reputably by the Services and Advocacy for LGBT Elders (SAGE). SAGE is a trusted resource within the professional community of advocates and service agencies addressing the needs of LGBTQ older adults in the United States. This entry will explore the topic of LGBTQ-friendly, affordable senior housing and why it is a critical component in the sphere of Public Administration. Topics discussed will include the foundations of why LGBTQ individuals require specialized care and/or housing, such as their unique needs, barriers they face when attempting to attain affordable housing, what inclusive housing looks like, the current state of LGBTQ-friendly senior housing in the United States, and identifying as well as addressing the root causes of these aforementioned unique needs and barriers as the issue moves forward and becomes a larger component in Public Administration and policy.

## Background, Challenges, and Relevance to Public Administration

The US Census Bureau data estimates that 1/5 of Americans will approach retirement age by 2030. Additionally, in 2035 approximately 78 million people will be aged 65+, outnumbering the projected number of people in the country under 18 (US Census Bureau, as cited in Sullivan 2019). This incoming "Silver Tsunami" portents multiple issues for the country's aging population and public administration resources alike. Current estimates place 29 states as having housing deficits, rendering the housing shortage at approximately 3.3 million units (Khater et al. 2020).

Correspondingly, the number of LGBTQ older adults will increase along with the rise of the Silver Tsunami. Currently estimated at about three million people, the US' LGBTQ senior population will reach seven million by 2030 (SAGE 2020b). This surge will compound the issues already faced by older adults in terms of affordable housing and will certainly exacerbate the limitations LGBTQ seniors experience in finding culturally competent, LGBTQ-friendly affordable housing. For example, older adults within the LGBTQ community face housing discrimination at a concerning rate as opposed to their heterosexual counterparts (The Equal Rights Center 2014, as cited in SAGE 2020). This population also experiences health disparities unique to the LGBTQ community that must be taken into account when discussing the needs of older LGBTQ adults, including depression, social isolation, and heightened risks of experiencing chronic conditions such as diabetes, heart disease, HIV/AIDS, Alzheimer's, and more.

Another unique challenge faced by the LGBTQ older adult population is their general lack of support networks. This can be attributed to numerous factors, such as an absence of children, little to no contact with family of origin, death of a long-term partner, or all the above. Each of these factors may have a detrimental impact on an individual and are intensified by the fact that LGBTQ older adults are more likely to experience poverty than their heterosexual peers. Nearly 33% of LGBTQ adults ages 65+ live at/below 200% of the federal poverty level. Once LGBTQ individuals reach the age of 80+, this percentage rises to 40% (Emlet, as cited in SAGE 2020).

The combination of LGBTQ seniors' unique health disparities and their high probability of experiencing discrimination and poverty culminate

into the possibility of facing homelessness. The population of homeless senior citizens is projected to increase from 44,000 in 2010 to 95,000 by 2050 (The Homeless Research Institute of the National Alliance to End Homelessness n.d., as cited in SAGE 2020). The Movement Advancement Project (MAP and SAGE n.d.) stated a similar opinion in a recent report, claiming that LGBTQ seniors' lower incomes and decades of discrimination often lead to unstable housing, leaving these seniors spending a disproportionate amount of time in emergency shelters.

Fiscal and societal elements often lay the foundation for an individual's health and physical well-being. In fact, an integral element in societal health is access to housing (LGBT Older People and Housing Challenges, SAGE 2020). Beyond the obvious instance of homelessness, a lack of affordable housing may cause other harmful, long-term effects on LGBTQ seniors. For individuals "trapped in a cycle of crisis and housing instability due to poverty, trauma, violence, mental illness, addiction, or other chronic health conditions, housing can entirely dictate their health and health trajectory" (Corporation for Supportive Housing 2014, p. 2). This correlation highlights one of many factors which justifies the inclusion of affordable LGBTQ-friendly senior housing as an area of concern for the field of public administration: a lack of housing may result in unparalleled strain on other public resources and individuals living in poverty or on fixed incomes.

## Unique Needs of LGBTQ Seniors

### Health

Factors such as stigma, discrimination, and violence increase the likelihood of health disparities in LGBTQ individuals. Adults in the LGBTQ community often feel immense pressure to hide their sexual or gender identity when considering moving to a retirement community. This apprehension, amplified by a lack of quality senior housing in general, highlights the glaring absence of adequate housing access for LGBTQ elders. Compounding this, health disparities for older LGBTQ adults can be incredibly nuanced and vary in different races and ethnicities. For example, it is professionally reported that older LGBTQ adults are more likely to experience depression and to smoke and drink regularly than heterosexual adults. Additionally, HIV is more likely to be a reported diagnosis by Hispanic and African American LGBTQ older adults than by White LGBTQ older adults. Asthma, diabetes, and visual impairment are more likely to be experienced by Hispanic LGBTQ older adults than those of other ethnicities, whereas African American LGBTQ older adults at heightened risk of experiencing complications from high blood pressure and/or obesity (American Heart Association 2018). These disparities are particularly relevant to the inclusive affordable housing urban issue: nearly 1/5 of the LGBTQ older population consists of people of color, which will only increase as the tide of the Silver Tsunami rises higher.

### HIV/AIDS

While not exclusively an LGBTQ issue, HIV/AIDS has disproportionality affected this population since its onset in the early 1980s (Fredriksen-Goldsen et al. 2013 as cited in, Hoffman 2016). The available research covering HIV positive seniors suggests that HIV diagnoses are on the rise in adults ages 50+, though the data covering this topic is limited. Studies have identified older gay and bisexual men, transgender elders (particularly those of color), and older lesbian women as the segments of the LGBTQ community most likely to be affected by HIV/AIDS. Older adults are less likely than younger individuals to be asked questions by their physician regarding sexual activity and use of drugs. This leads to underreporting of red flags, which would otherwise prompt a doctor to test the individual for HIV, despite the importance of identifying the presence of HIV/AIDS as early as possible (SAGE 2020). LGBTQ older adults' higher likelihood of living with HIV is a factor addressed by most existing LGBTQ-friendly affordable housing facilities. According to the 2nd Edition of the Understanding the Affordable Housing Development Primer, the key difference that makes LGBTQ-friendly affordable housing projects

unique is their propensity to foster a sense of community among special-needs elders (such as veterans and/or those living with HIV); ensuring linkage to care for the unique needs of these special populations; and enforcing income restrictions on a portion of units to make "monthly rents more affordable for lower income residents through the use of federal programs such as Project Based Section 8 Housing Choice Vouchers or HOPWA" (SAGE 2020b, p. 6). Numerous studies have examined the relationship between HIV transmission and homelessness or stable housing. One such study determined that overall, housing stability was linked to improved health via decreasing HIV risk behaviors and maintaining consistency with antiretroviral therapy, (Leaver, Bargh, Dunn, & Hwang, 2007, as cited in, Ecker J, Aubry T, Sylvestre J 2019). Because LGBTQ adults are at such a disproportionally high risk for experiencing homelessness, the prompt attention of public administrators is warranted to prevent snowballing administration concerns moving forward (Ecker et al. 2019).

## Barriers to Affordable Housing

### Poverty

The US Census Bureau estimates that 16.1% of American elders live in poverty, including hundreds of thousands of LGBTQ senior citizens. Additionally, 24% of lesbians and 15% of gay and bisexual men can be classified as living at or below the federal poverty level. For the LGBTQ's community's heterosexual peers, the poverty percentage is 19% and 13% of heterosexual women and men, respectively, a gap which will only grow as LGBTQ individuals grow older (Albelda, Badgett, Schneebaum, & Gates 2009, as cited in SAGE 2011). A similar study posits that older LGBTQ couples grapple with higher poverty rates than heterosexual peers, signifying that as the number of people age 65+ surges, as will the number of impoverished LGBTQ older adults.

Further research reveals that LGBTQ older adults of color face an increased risk for experiencing poverty. A recent study states that LGBTQ older adults who identify as African American, Hispanic, and Native American are more likely to face barriers accessing health care/medications than non-Hispanic white LGBTQ older adults (SAGE and MAP 2017). The impact that this vulnerability has on the health of minority individuals relates to Public Administration through increasing the strain experienced by public resources. By deferring appropriate healthcare due to lack of funds, this can ultimately lead to more serious medical problems that place even higher amounts of pressure on public health services and facilities (Reina 2019).

This issue can further be linked to Public Administration through LGBTQ older adults' overall fear and mistrust of healthcare professionals. This wariness often leads to LGBTQ seniors not going to their doctor or healthcare provider until it is absolutely compulsory, due to expected harassment and discrimination by healthcare providers and caregivers alike. There is subsequently a strong need to incorporate more comprehensive and culturally competent policies for LGBTQ seniors, especially in long-term, age-in-place settings such as affordable housing facilities. Implementing and/or providing access to culturally competent, LGBTQ senior-focused public policy or training curriculum within affordable housing facilities may instigate a shift in LGBTQ senior attitudes toward healthcare, ultimately resulting in less strain on public health services.

As the US population (and with it the LGBTQ population) grows older, the need for senior housing and resources rises along with it. However, LGBTQ seniors already face unique barriers finding accepting and affirming affordable housing, with a lack of federal protections against discriminations rendering it an even larger challenge. Discrimination and poverty are dovetailing barriers to care for LGBTQ seniors: older LGBTQ adults are often discriminated against and not permitted the same rights as those in heteronormative marriages or relationships such as security, benefits, and protections (The Equal Rights Center 2014). This prejudice has a significant impact on financial security, especially if the couple is retirement-age. One example of these long-term effects is demonstrated in same-sex couples

having historically been prevented from the right to marry. Despite the landmark 2015 ruling *Obergefell v. Hodges*, in which the Supreme Court struck down remaining statewide bans on same-sex marriage, a 2013 Pew Research Survey states that four in ten LGBTQ adults have been rejected by a close family member due to their sexual orientation. This can have ramifications on estate planning, such as unsupportive family members contesting a will or challenging the validity of a marriage (Maier 2020). Issues such as these may lead to many LGBTQ seniors losing access to property, assets, or even confronting poverty after the loss of a partner, despite having a state-sanctioned, legally binding marriage.

### Discrimination, Stigma, and Violence

Discrimination and victimization are strong factors that contribute toward the mental and physical well-being of older LGBTQ adults (Fredriksen-Goldsen et al. 2013). For example, a 2018 survey of LGBTQ seniors revealed that 21% of those surveyed have disclosed their sexual orientation or gender identity to their doctor for fear of being discriminated against or receiving inferior medical care. This lack of transparency can lead to medical complications and increased risks, especially since LGBTQ older adults have pervading and unique health disparities already in place (Seegert 2018).

LGBTQ people further experience discriminatory treatment in mainstream healthcare settings. The Equal Rights Center conducted a 2014 survey that revealed half of older LGBTQ partners applying for housing experience discrimination of some sort, with 89% predicting that they would be denied for their sexual orientation and/or gender identity. A similar report published by the National Center for Transgender Equality and the National Gay and Lesbian Task Force stated that transgender individuals were discriminated against with pervasive insensitivity. The study further revealed prevalent violence toward transgender patients in medical settings, including but not limited to emergency rooms, mental health clinics, drug treatment facilities, and substance abuse programs (Grant et al. 2011). Additionally, over 2/3 of relevant agencies lack staff training regarding LGBTQ-aging, along with an even greater deficiency in these agencies regarding LGBTQ-specific outreach and programming (Knochel et al. 2012).

A more recent 2015 survey reported 73% of LGBTQ Americans are strongly concerned about discrimination from agents, landlords, and neighbors (Eisenberg 2015, as cited in Graves 2018). These looming apprehensions felt by the LGBTQ communities may stem from the fact that in over half of the states in the United States, it is either legal to deny housing based on sexual orientation or gender identity or there is statewide law or policy that prevents discriminating on the basis of sexual orientation or gender identity.

These concerns are particularly relevant to public administrators, as healthcare disparities lead to administrative consequences and place an avoidable strain on resources and funds. By prioritizing the development of policies and practices that are inclusive, not only are the needs of vulnerable subsections of society better met, but the administrative system uses resources more efficiently (Artiga et al. 2020). Discrimination, particularly over the course of a lifetime, acts as a root cause for income and health disparities in target populations leading to otherwise avoidable healthcare and employment-related expenditures of up to $31 billion annually (Smialek 2014). These costs place a monumental amount of strain on public administration systems and represent key areas of vulnerable citizens being inequitably prioritized and underserved.

## Current LGBTQ-Friendly Senior Housing

Currently, there are 12 states in the country with resources and senior housing facilities specifically intended for LGBTQ older adults. These states, (California, Florida, Illinois, Massachusetts, Minnesota, North Carolina, New Mexico, New York, Ohio, Oregon, Pennsylvania, and Washington) each have one or more operational affordable, LGBTQ-friendly senior housing facilities. These facilities often include space(s) colocated onsite for specialized service needs of its tenants. These may include but are not limited

to case management services, primary health care clinics, social work agencies or services, access to transportation, and wellness and community programing (SAGE 2020b). Despite LGBTQ seniors being an underserved and understudied population, research, studies, and polls that have extensively explored this community's needs cite senior housing among their premier needs (Seegert 2018), justifying the concern as a relevant public administration urban issue.

## Moving Forward

Public administrators in urban municipalities would benefit from focusing on the underdeveloped area of inclusive housing. Not only is the LGBTQ senior population anticipated to expand to seven million by 2030, but this issue is further compounded by the current 3.3-million-unit housing shortage in the United States combined with the overall shortage of inclusive, affordable LGBTQ-friendly housing. The lack of these facilities in urban and metropolitan areas places immense pressure on public resources, as LGBTQ older adults have unique health disparities that need specialized attention. Additionally, these individuals are more inclined to reside below the poverty level, a factor which is particularly relevant to the sphere of public administration. These trends and similar disproportional representations of risk factors should remain at the forefront of discussions of urban issues in the United States.

## Conclusion

A lifetime of discrimination has taken a physical and fiscal toll on LGBTQ seniors. Advances in modern medicine, better nutrition, and progressive technology have enabled the "baby boomer" generation to survive longer than previous generations, which means older LGBTQ individuals are living longer despite their unique health disparities. However, LGBTQ adults are at higher risk than their cisgender/heterosexual (or non-LGBTQ) counterparts to experience homelessness and loss of familial support systems. Affordable, inclusive senior housing is therefore a critical component in the topic of public urban issues, as are the barriers faced when attempting to meet these urgent needs. Public administrators can benefit from recognizing this vulnerable population's needs, which increase annually alongside the level of population density. While academics in the field of Public Administration have begun to lay the foundation for an understanding of this community's needs, practitioners lead the way in navigating strategic efforts to address them. Though the current state of LGBTQ-friendly senior housing in the United States is lacking, a handful of aforementioned states are paving the way for inclusivity. Following their example, the United States at large as well as members of the Public Administration field face an ever-growing challenge to meet the needs of the older adult community while viewing the issue through an equitable and inclusive lens.

# Incremental Theory of Decision-Making

Gardenia Harris
Illinois State University, Normal, IL, USA

## Synonyms

Incremental model of decision making; Incrementalism; Successive limited comparison

## Definition

The incremental theory of decisionmaking posits that decisionmakers use previous activities, programs, and policies as the basis for their decisions and focus their efforts on incrementally increasing, decreasing, or modifying past activities, programs, and policies (Dye 2013). This method of decisionmaking contrasts sharply with the rational model of decisionmaking which involves conducting a thorough analysis of all possible options and their consequences and then evaluating their advantages and disadvantages (Lindblom 1959). Instead, they rely on "successive limited comparisons" to simplify decisionmaking (Lindblom 1959, 81). Successive limited comparisons consist of comparing a

limited number of options that are not too different from the current solution or practice (Kleindorfer et al. 1993; Beach 1997) and differ only marginally from each other (Pal 2011). According to incremental theory, decisions are not made all at once and committed to at the onset but progress in a step-by-step fashion (Beach 1997) and are refined through trial and error (Atkinson 2011). This approach allows decisionmakers to adjust solutions considering their effectiveness or stakeholders' responses (Beach 1997). Although originally developed to describe decisionmaking in the public policy arena, the incremental theory of decisionmaking concurrently evolved into a theory of organizational behavior that explains decisionmaking in complex organizations, such as bureaucracies (Atkinson 2011).

## Introduction

Economist Charles E. Lindblom (1959) introduced the incremental model of decisionmaking in his seminal article, *The Science of "Muddling Through"* (Beach 1997). Lindblom developed this theory of to explain how public policy is enacted in Western democracies. This groundbreaking paper observed that in the public policy arena, actual decisionmaking deviates radically from the normative rational model of decisionmaking. Decisionmakers applying the rational model of decisionmaking purport to analyze all relevant information, each possible option, and all potential consequences prior to making their decisions. Lindblom noted that public agencies rarely undertake such comprehensive analyses of problems and potential options, yet public still evolves in the absence of such analysis (Beach 1997). Lindblom (1959) proposed that instead of undertaking a comprehensive analysis, policymakers in Western democracies expedite policymaking and reduce political conflict by only seriously considering adopting program and policy options that are marginally different from those already in place (Dye 2013).

According to the incremental theory of decisionmaking, instead of analyzing information to develop new strategies to address flaws in the status quo, decisionmakers typically accept the legitimacy of established solutions and focus their efforts on modifying them (Dye 2013). For example, the two major US political parties, the Democrats and Republicans, agree on policy fundamentals and limit their policy debates to differing definitions of problems or developing and enacting policy alternatives that are only modestly different from the other political parties (Lindblom 1959).

The high level of uncertainty and unknown consequences that are inevitable by-products of enacting completely new or vastly different programs motivates policymakers to avoid enacting new or different programs. In addition, the significant psychological, political, and psychological commitment various stakeholder groups have toward existing programs further dissuades policymakers from undertaking radical change, for fear of displeasing certain constituent groups. Therefore, only policy alternatives which cause little psychological, physical, economic, organizational, or administrative dislocation are seriously considered (Dye 2013).

## Human Limitations

Pal (2011) maintains that humans developed the strategy of incrementalism to deal with their cognitive and resource limitations. Incremental theorists contend that constraints on resources such as cognitive ability, time, and funding prevent decisionmakers from identifying the full range of alternatives and their consequences. They maintain the rational evaluation of all but the simplest decisions is impossible for several reasons: (a) the difficulty of deciding on a "best" outcome or direction since different stakeholders have different goals and values leading to multiple conceptualizations about the desired outcome; (b) the potential outcomes of most decisions are so extensive, it is impossible to identify and evaluate them all; and (c) the absence of adequate information about the short-term and long-term consequences of decisions makes analysis impossible. Proponents of the incremental theory note

that even if all consequences could be identified and studied, the cost of doing so in terms of time, effort, and money would be prohibitive (Beach 1997).

In addition to the uncertainty they face (Atkinson 2011), decisionmakers are often expected to be decisive and to produce tangible results in a limited period (Pal 2011). Considering the multitude of factors that must be taken into account as well as the time pressures, decisionmakers confronted with complex problems must somehow simplify the decisionmaking process (Lindblom 1959). Decisionmakers can greatly reduce risk if they experiment with small changes and exercise the option to either advance or retreat based on how things are working (Beach 1997). Incrementalists argue that if something goes wrong, small changes can be more easily reversed (Pal 2011).

## Mutual Adjustment

Despite a lack of stakeholder agreement on goals, the solutions and polices that evolve tend to satisfy a wide variety of stakeholders' interests (Lindblom 1959). Even in the absence of explicit negotiation, some form of consensus regarding the basic components of a good solution usually arises (Allison and Saint-Martin 2011). Lindblom attributed this agreement to the process of "mutual adjustment" (Lindblom 1959, 85). Mutual adjustment is a form of quasi-coordination resulting from the mutual impact people and groups have on each other. During this process, options are modified to satisfy the anticipated needs and actions of others, without any explicit compromise (Atkinson 2011). Mutual adjustment is a dynamic process. At various times, the needs of individuals or groups that have been neglected at some point are brought to the forefront at another time (Lindblom 1959). Although this process seems piecemeal and fragmented, it often leads to solutions that represent a wider range of interests (Lindblom 1959) and solutions that more fully reflect collective preferences of interested parties than would explicit centralized negotiations (Atkinson 2011).

## Critique

Proponents of the incremental theory of decisionmaking tout its practicality and ability to bring about significant political and organizational change. They contend that Lindblom's belief in the limits of rationality is well founded. They further maintain research and experience simply do not support the concept of rational-comprehensive decisionmaking process (Pal 2011). For example, Dye (2013) asserts that a completely rational model of decisionmaking is inefficient because the effort and cost involved would be excessive. The fact that organizational actors must only decide on small modifications to the status quo is associated with expediency and reduces conflict, contributing to organizational and political stability (Dye 2013). Enacting small changes reduces the risk of major controversies and stalemates, limits the losses of individuals or groups with other policy preferences, and helps maintain a working majority (Allison and Saint-Martin 2011).

Critics of incrementalism challenge its stance on the impossibility of conducting comprehensive rational analyses. They argue that even though human intellectual capacity is limited and imperfect, the computer power developed since Lindblom's original analyses in the 1950s and 1960s has increased humans' ability to conduct comprehensive analyses on large amounts of data (Scott Jr 2010), making complex comprehensive analysis more feasible.

Other critics of the incremental theory of decisionmaking charge that because the status quo is used as a basis for decisionmaking, the theory is too conservative (Dye 2013). Netting and O'Connor (2003) categorize incrementalism as conservative because it is designed to yield decisions that are acceptable to the majority of organizational members, particularly those in power. They further argue that since the goal of incremental change is the reestablishment of equilibrium as quickly as possible, incremental decisionmaking has a conservative effect.

However, others do not agree regarding the inherent conservatism of the incremental decisionmaking approach. Atkinson (2011)

challenges discomfort with the status quo by arguing that attachment to the status quo is not necessarily irrational, and change for the sake of change is not always better or beneficial. Kleindorfer et al. (1993) suggest hasty solutions usually fail because organizations do not have an opportunity to adapt to them. In a similar vein, Allen and Coates (2009) emphasize the benefits of slowing adopting new practices to avoid making costly mistakes that could be costly. Beach (1997) argues that as a result of feedback, entirely new directions and perspectives that were never anticipated may evolve and then be considered (Beach 1997).

Lindblom also objected to its characterization as conservative, arguing that significant change can accrue using this model, if the small steps happen in quick succession and build on each other (Pal 2011). Others argue that incrementalism is not the source of the deficiencies in the policymaking process (Atkinson 2011). For example, Allison and Saint-Martin (2011) attribute the slowness of policy change characteristic of the US political system to the nature and structure of the US political system itself, with its multiple decision and veto points and checks and balances, rather than the incremental decisionmaking process.

Although proponents consider the potential to more easily reverse directions as a major strength of incrementalism, detractors disagree. They observe that all decisions engender procedures and practices to which some individuals and constituent groups become committed. For them, the concept of easy reversal of small incremental steps ignores the fact that people become committed to the outcomes of even small decisions. Reversing those decisions may not be easy because it requires dealing with people and groups already invested in them (Pal 2011).

Lindblom acknowledges the weakness of incremental decisionmaking in regard to fragmentation of decisions (Allen and Coates 2009). Others also note the "muddling through" approach is vulnerable to generating unintended consequences. Recent US military experiences in Iraq and Afghanistan demonstrate the pitfalls of not conducting a comprehensive analysis before acting (Scott Jr 2010). Scott Jr (2010) maintains the outcomes of those military interventions would have been more positive had policymakers undertaken a more rational and comprehensive analysis. In fact, he believes success was only achieved after such an analysis was undertaken. Other detractors worry organizations that "muddling" through decisionmaking can inadvertently move the organization away from its original goals (Scott Jr 2010).

Incremental decisionmaking may be inadequate in times of crisis. Dye (2013) suggests the rapid expansion in US government spending during the 2008 Great Recession demonstrates policymakers deem incremental measures insufficient during economic crises.

Finally, others question the global applicability of the theory and note Lindblom used the US political system as his reference point, leading to concerns his theory may not apply to other political systems that converge significantly from the US political system (Pal 2011).

## Implications

Proponents of incremental decisionmaking believe organizational and policy change is more effective and efficient when performed in small increments. One of the major implications of incremental decisionmaking is the use of small experiments or pilot projects which allow the incremental evaluation of ideas (Beach 1997). When decisionmakers test their ideas by making small changes, they can observe their effects and adjust based on the information and feedback they receive. This process should be repeated over and over in small steps (Beach 1997), until the desired outcome is achieved. Another implication is that options considered should be close to current practice to reduce risk and make it easier to predict the consequences of decisions (Pal 2011).

Decisionmakers should also be aware that incremental decisionmaking may not suffice in all situations and that at times, major policy shifts will be necessary. When major policy shifts are warranted, decisionmakers should look at decisionmaking in a new way, making conscious efforts to move away from normative options.

Furthermore, major policy shifts should be driven by universally accepted visions of the future that are aimed at solving problems without arousing the opposition of stakeholders (Beach 1997).

## Conclusion

The incremental theory of decisionmaking provided one of the first major attacks on the rational model of decisionmaking. Rather than focusing on an idealized view of decisionmaking, incremental theory emphasizes its practical aspects (Allison and Saint-Martin 2011; Pal 2011).

Although Lindblom acknowledged weaknesses of the incremental approach to decisionmaking including the potential to overlook policies unrelated to the current policy (Allen and Coates 2009), he thought incremental decisionmaking was the preferred decisionmaking strategy because when confronted with deficiencies in current policy, the most reasonable organizational response is to make minor adjustments and use trial and error to see if those adjustments are effective or not (Atkinson 2011). Therefore, for most policy problems, incrementalists see no practical alternative to the incremental method of decisionmaking (Atkinson 2011).

# Independent Regulatory Agencies in Coordination of Public-Private Partnerships and Other Economic Institutions

Ethelbert Chinedu Nwokorie
Faculty of Philosophy, Public Management Unit, University of Vaasa, Vaasa, Finland

## Synonyms

Concession; Coordination; Partnership; Public sector; Stakeholders

## Definition

Independent regulatory agency refers to a specialized government organ that supervises the entry of private sectors in traditionally state-managed sectors, fixes standards, and oversees activities of partners in order to ensure that terms of the contract are strictly followed and success achieved.

## Introduction

Public-private partnership (PPP) is a government-sponsored initiative where a government agency collaborates with the private sector to provide quality infrastructures and services to the people

through long-term concessions or short-term service contracts. The risks of providing facilities and services in PPPs are equitably shared between public and private sector organizations (Busch and Givens 2012; Mahalingam et al. 2011, pp. 341–372; Ciccone 2010, pp. 48–51; Forrer et al. 2010, p. 476). Through PPPs, governments harness private sector expertise to bring maximum efficiency and effectiveness in provision of public infrastructures and services that are traditionally provided by the public sector (Babatunde et al. 2012, pp. 212–225). PPPs provide a window for private sector participation in providing public infrastructures and services. Through PPPs, governments across the world are making progress in delivery of infrastructures and services to their citizens.

Economic regulation could be explained in terms of clear legislative and administrative control of all aspects of entry into economic activities including PPPs. Independent regulatory agency (IRA) refers to a specialized government organ that supervises the entry of private sectors in traditionally state-managed sectors, fixes standards, oversees activities of parties involved in order to ensure that terms and conditions of the contract are strictly followed and success achieved. They are creation of legislative acts, separately organized bodies headed by unelected officials. They are legally empowered to perform regulatory functions over government economic activities, including PPPs. They are institutionally designed to be independent to avoid political interferences. If regulation is done by government agencies, the government can directly/indirectly influence the regulators policies and decisions (Cambini and Franzi 2013, p. 180; Thatcher 2002, pp. 125–147). The public interest theory of economic regulation motivates government involvement in PPPs and other economic activities across the world. Public interest theory explains economic regulation as governments' reaction to public demand for correction of unfavorable market practices (Posner 1974, pp. 1–36). Absence of a regulatory agency to coordinate PPPs and build trust among partners from the early stages creates circumstances for future conflicts and failure of PPPs.

IRAs are important in strengthening collaborative management, establishing trust, and avoiding opportunistic behaviors by partners. However, poor structuring, legal framework, government interferences, etc., create circumstances that challenge PPP success. This raises discussions on the need for an IRA to harmonize the challenges and make PPPs succeed. This agency is important in PPP lifetime, beginning from the early stages. It facilitates proper delivery of PPP projects by ensuring that contract terms are maintained and interest of the public and private sectors and consumers protected, guarantee value for money, and increase efficiency, effectiveness, and accountability of PPPs (Farquharson et al. 2011, p. 133; Pongsiri 2002, pp. 487–495).

## PPP Coordination by Independent Regulatory Agencies

Coordination is a process of bringing harmony and equilibrium in an organization (Fayol 1949, p. 5). It is a major instrument in making different functions and structures to fit into an overall goal (Selznick 1957, p. 5). Coordination aims to prevent fragmentation in order to achieve a common objective. It aligns organizational functions, structures, and resources together in order to achieve organizational goals (Viinamäki 2004, p. 17). Murugan (2004, p. 384) characterizes coordination as a continuous dynamic process. It aims to ensure that different parts of an organization function without difficulties and achieve its purpose with minimum friction and maximum collaborative effectiveness (Agarwal 1982, p. 235). In this study, coordination is defined as a process through which conflicts and differences are harmonized in order to make PPPs succeed. The four principles of coordination by Mary Parker Follett emphasized (i) the need to start coordination in management from the early stage, (ii) continuity of coordination, (iii) being in direct contact with the parties, and (iv) reciprocal relationships among parties (Bose 2012, p. 48). These emphasize the importance of coordination from the beginning to completion of PPPs and the importance of coordination in maintaining constant communication

among parties for them to see reasons to make compromise. Coordination reduces possibilities for conflict and failure of PPPs. Good coordination strengthens interdependence of partners because there is nothing to coordinate if there is no interdependence (Malone and Crowston 2012, pp. 10–11; Brenninkmeijer 2010, p. 124). Governments across the globe establish IRAs to ensure proper coordination and success of PPPs. IRAs are staffed with PPP specialists to supplement government capacity in awarding and monitoring PPP contracts. They coordinate PPP activities and processes at every stage (Mahalingam et al. 2011; Pongsiri 2002).

IRAs perform such functions as quality control, policy formulation and coordination, technical advice, standardization, and PPP promotion (Istrate and Puentes 2011, p. 2). The World Bank (2007, pp. 20–21) defined IRA as any organization designed to promote and improve PPPs, with lasting mandate to manage quality of PPP programs, attract more PPPs, and ensure that PPPs meet defined criteria like quality, affordability, value for money, and risk transfer. IRAs are important in structuring and implementing PPPs. They are expected to have expertise in project management; contract financial, technical, and legal management; monitoring quality of service; contract compliance; project evaluation; performance monitoring; and partnership management (United Nations ESCAP 2011, p. 25; Burger 2009; Pongsiri 2002).

Sound knowledge of PPP project(s) preparation, procurement, and management equips IRAs to develop ways of engaging private sectors where and when necessary, protect private sector interests, and shield them from direct or indirect expropriation (Skietrys et al. 2008, p. 25; Pongsiri 2002). IRAs address PPP challenges and provide information linkage between parties in the partnership and the public where necessary (UNESCAP 2011). IRAs collaborate with the awarding government agency and private sector to take care of any disagreement that could lead to program failure (Lemma 2013, p. 5; Regan 2012). Sanghi et al. (2007, p. 2) explained that governments create IRAs to make PPP management effective and avoid failures. They bring quality control, policy formulation and coordination, technical assistance, standardization, and marketing promotion for success of PPPs where governments' procurement policy, strategy, and incentives are poor.

Coordination function starts from assessing the most viable type of PPP for a given project, weighing possibility of meeting identified objectives of the parties, and clearly defining the project implementation structure. This encourages partners to recognize the needs and interests of each other and provide effective ground for coordination from the beginning (Regan 2012; European Commission Directorate-General Regional Policy 2003, p. 5). Experienced IRAs design and make PPPs competitive to attract more bidders. This helps to bring transparency in the process and make negotiation easy and less time consuming (Cheung et al. 2012, pp. 647–666). Low bidder turnout in PPP process arises when contracts are poorly designed and unable to attract bidders to make the process competitive (Burger 2009, p. 13).

Managing PPPs requires special capacity to identify, develop, and evaluate alternative financing options, optimal risk transfer, contract negotiation, and management (United Nations ESCAP 2012). IRAs act on behalf of government agencies in negotiating optimal deals with private companies, carry out feasibility studies, prepare detailed project reports, manage the bidding and negotiation process, and monitor performance and progress of PPP projects (Kim et al. 2011, p. 10). They promote and improve PPPs, in response to government failures regarding poor procurement incentives, lack of coordination, high transaction costs, and lack of skills and information. They ensure that projects fulfill specific quality criteria (Regan 2012, p. 3; World Bank 2007). Greater involvement of IRA through the life cycle of PPP is necessary to guarantee that real benefits are delivered to the people (Mahalingam et al. 2011; Dutz et al. 2006).

Interestingly, few PPP projects have been successfully delivered in some countries without IRAs. For example, in Spain, a number of PPP projects in various sectors have been successfully delivered without IRA (EPEC 2014, p. 18). Despite the positive roles of an IRA, often times, the presence of IRAs has not guaranteed better PPP coordination and success. However, this

happens where the IRA lacks specialized knowledge and experience and without a coordination framework. Where coordination is done in a trial and error method, such leads to negative coordination, which represents mere agreement to avoid conflict in the absence of specific guidelines (Lægreid et al. 2013, p. 27). The Dar es Salaam Water and Sewerage Authority (DAWASA) and City Water Services PPP in Tanzania are a good example. DAWASA and the Tanzanian Minister of Water and Livestock Development were unable to successfully coordinate the PPP because they lacked the technical knowledge and experience. Another example is the failed London Underground PPP, where Transport for London and London Underground Limited were unable to successfully coordinate the PPP with Metronet due to lack of technical know-how, resulting to the early failure of the PPP (Hallikeri 2012). Also in 2002 in Denmark, the Farum local government PPP with FIH institute was unable to achieve the construction of the indoor sports arena and soccer stadium because of similar reasons. Other reasons include poor and uncompetitive bidding process, the absence of national legislation on PPPs, poor risk assessment, the absence of PPP experts to ascertain financial implications of the deal to Farum local government, and the absence a specialized IRA. Instead, Farum local government acted as the coordinator (Greve and Ejersbo 2002; Ole 2011). In all the failed cases, despite lack of technical knowledge and experience, the awarding government agencies coordinated the PPPs.

In 1996, Alandur Municipality in India lacked the capacity to execute a state-of-the-art sewerage system. She approached INFRACREATE, an agency that coordinates PPPs in water sector in the state of Tamil Nadu, for assistance. INFRACREATE designed and structured the project; prepared project memoranda; negotiated lending rates; developed the financial structure and conflict resolution mechanisms; prepared the bid documents, evaluation procedures, and a concession agreement that featured equitable risk sharing; and solicited for bids. Several companies submitted bids. In the year 2000, the project was awarded through an open transparent bidding process. However, INFRACREATE's involvement was discontinued at the implementation stage. Having established ground for a smooth takeoff, the project started on a fairly good note. As the implementation progressed, the exit of INFRACREATE began to have a negative effect on the entire project coordination beginning with delays in approvals and inspection to changes in project plan. Finally, lack of communication by parties involved led to a conflict that subjected the PPP to litigations (Mahalingam et al. 2011, pp. 341–372). This highlights the important role of an IRA in coordinating and implementing PPP contract terms from the beginning to the end.

These examples highlight the need for IRAs and strengthen World Bank's (2007) claim that IRAs promote and improve PPPs in response to government poor procurement incentives, lack of coordination, high transaction costs, and lack of skills and information. In Spain, PPPs in transport sectors, for example, were successfully delivered without IRAs because at the Spanish national level, there are sector-focused bodies such as Sociedad Estatal de Infraestructuras del Transporte Terrestre (SEITT) which is deeply involved in delivery of PPP projects in transport sector. Though SEITT is not an independent regulatory agency, it performed the same functions IRAs perform in PPPs. SEITT functions include supporting development of business case for concessions, analysis of concession tariff structures, supporting definition of policies for the development of concessions, preparation of terms and conditions for concession procurement, and viability assessment and financial structuring of concessions. These are the roles IRAs perform in PPPs. IRAs coordinate PPPs from proposal stage to completion and provide policy and technical guidelines for successful implementation (Shen et al. 2006, pp. 588–589). They also ensure that PPP contracts are technically well designed and successfully implement PPP success factors as contained in the contract. The design of PPP contracts by IRAs provides framework for coordination and contract implementation. The frameworks include the PPP success factors which are implemented by IRAs. Some of the success factors are discussed below.

## Sound Legal and Regulatory Framework

The legal and regulatory frameworks of PPPs provide mechanisms for monitoring and accountability, in order to hold the government or private sector responsible and accountable for the project breach and failure. The structure of PPP contracts provides clear implementable structure to stop activities that could affect the success of PPPs. It also provides opportunity to dialogue with stakeholders on relevant issues capable of attracting opposition and risks associated with private sector participation in government economic projects. For example, public resistance to private sector involvement and other unforeseen issues may affect project actualization. It also put down a clear, transparent and predictable rule for dispute resolution (OECD 2012; Triche 2012). In addition, a PPP contract spells out the mechanisms for guaranteeing quality of project or service to be provided (Qizilbash 2011). IRAs create public vision for PPPs by establishing short- and long-term public interest in the project, describe the strategy for project actualization, and ensure public acceptance and cooperation toward PPPs. It also ensures that the contract implementation follows established legal framework (Corrigan et al. 2005, p. 2).

## Appropriate Risk Allocation

The main element of every PPP is value for money, and this can only be achieved when risks are properly distributed among parties. To achieve value for money, government takes back risks it can properly manage (Loosemore and Ng 2007, p. 70). PPPs yield good results when the parties have likely knowledge of potential uncertainties that might arise during implementation. Such knowledge helps the parties to develop appropriate workable risk allocation mechanisms (Lossa and Martimort 2012, pp. 463–464). Parties in PPPs are expected to carry out project risk identification and categorization, where project risks are classified according to their levels. After risk classification and identification by the parties, bidders evaluate estimated cost of managing such risks before making their bids. If the public sector considers the bid price acceptable and also considers the project's net present value of payment streams lower than its public sector comparator, she can award the contract to a preferred bidder (Bing et al. 2005, p. 26). In this sense, the risks have been equitably shared by the parties. IRAs bring technical competence in risk identification, classification, and evaluation and also in assessing the capacity of the bidding companies to manage those risks.

## Project Feasibility Study

Feasibility evaluation stage of PPPs is critical to both public and private sectors for the success of PPPs; it guarantees if the project is feasible or not. Especially, as the private sector inherits public sector infrastructures in most PPPs (Ng et al. 2012, pp. 423–432). It is a technical working document with detailed project engineering design and construction standards. It contains information on every aspect of the project to enable full project appraisal. It provides information about the project value assessment, economic rationale, risk identification, quantification and allocation, stakeholder consultations, management programs, mitigation plans, project affordability, project structure, financial model, possible constraints, project scope, viability, and due diligence. It also provides information on stakeholders, institutional capacity, etc. (Ministry of Finance Government of Pakistan 2007, pp. 9–15). At the procurement stage, an IRA focuses on bidders' technical, financial, and business capacity before selecting a preferred bidder. An IRA identifies these and scrutinizes issues like experience of the bidding companies and their technical and financial capacities before selecting a preferred bidder.

## Competitive Bidding Process

A transparent, competitive procurement process helps to make negotiation easy and less time consuming and provide conditions for successful project implementation (Cheung et al. 2012, pp. 647–666). Low turnout of bidders where the

market is large enough to attract enough bidders could possibly arise from unattractive contract design (Burger 2009, p. 13). Noncompetitive selection process and unclear and unattractive contract designs lay foundation for future conflict and failure of PPPs (World Bank 2012, p. 31). Part of the traditional role of IRAs includes providing expert advice and technical support from PPP procurement to conclusion and approving or rejecting PPPs at any stage, in line with its regulatory role (Lemma 2013, p. 5). They bring professionalism, skill, expertise, and adherence to PPP contract terms. This eliminates conflict of interest that negatively affects PPP success. When a PPP is not well structured, bidders may present low bids, as a strategy to win the contract with a view to resolve uncertainties through post-bid negotiations (World Bank 2012, p. 31).

## Trust

Trust is important from the beginning of PPPs for its continuity. It requires regular commitment, interactions, and communication (European Network and Information Security Agency 2011). When trust is built, conflicts are minimized, the partnership is stabilized, and continuity is enhanced. PPPs involve different parties, stakeholders, and actors; this increases possibilities for unexpected behaviors among parties and actors. Trust is important in eliminating suspicion, facilitating cooperation, and understanding among partners in PPPs (Grotenbreg et al. 2014, p. 8). By ensuring that parties are transparently abiding by PPP contract terms, independent regulatory agencies establish the foundation for trust and cooperation among parties and stakeholders in a PPP project.

## Political Support

Political support is a determinant factor of PPP success, especially in developing countries. Political support for PPPs eliminates chances of political-/government-related risks during PPP implementation. Government-related risks make it difficult for private sectors to interpret political information while analyzing political risks associated with a PPP project (Smith and Gannon 2008, p. 180). Political support is among the benefits of IRAs to PPPs. They bring continuous political support to PPPs, and this makes IRAs work effectively with both government and private sector institutions, as government makes best use of IRA specialist input into PPP policies (EPEC 2014, p. 10). Political support is important in getting approvals for PPPs, as well as getting government to release funds to meet public sector financial obligations in PPPs, eliminate delays in obtaining permissions, limit government interferences, and cushion effects of government regulations and laws on PPPs (Jacobson and Choi 2008, p. 652; Shen et al. 2006, p. 590). Political support increases chances of successful realization of PPP projects.

## Educating/Involving Community Stakeholders

Educating community stakeholders on PPP projects in their localities generates community support, minimizes risk exposure, enhances success, and optimizes return on investment (Pagdadis et al. 2008). Educating and involving community stakeholders in PPP programs within their locality helps to diffuse fear of exploitation as a result of private sector involvement in service and infrastructure provision in their community. Community education and involvement in PPPs provides opportunity to educate the people on the PPP objective, identify their needs and concerns, and achieve a consensus on the PPP (United Nations Economic Commission for Europe 2008, pp. 59–60). This measure eliminates community resistance and generates public support and achieves success and value for money. This is one of the outstanding mechanisms which IRAs employ to diffuse tensions and engineer stakeholder cooperation in PPP programs.

## Communication and Compromise

In PPPs, communication and the willingness to compromise by the parties are necessary for

success. Communication between partners provides a platform for problem identification and conflict resolution. Regular communication among parties establishes ground for trust and increases commitment to joint interest, efficient decision-making, and implementation. It also creates willingness to compromise and collaborate to avoid unnecessary conflicts (Jacobson and Choi 2008; Corrigan et al. 2005, p. 25). The role of an IRA in achieving this aim is vital because it has the authority to regulate the activities of the two parties according to terms of the contract, draw their attention, and possibly sanction any of the parties whose activities are not in line with the terms of the contract.

## Conclusion

Coordination enhances mutual understanding and common values and helps channel tasks toward achieving agreed goals. Independent regulatory agencies have been widely accepted as important instrument for coordinating PPPs. Owing to the success of IRAs in coordinating PPPs across countries, many governments across the world have found the need to create IRAs in order to deliver quality infrastructures and services through PPPs (EPEC 2014, pp. 18–19). For example, Regan (2012), Mahalingam et al. (2011), Dutz et al. (2006), Sanghi et al. (2007), and Pongsiri (2002), all pointed out the special roles of IRAs in making PPPs succeed. They are relevant to success of PPPs due to governments' lack of capacity to effectively manage PPP programs. In the UK, IRAs are so important that local authorities are given the responsibility to create PPP IRAs to regulate PPP projects. In Leeds, for example, IRAs provide guidance, support, and advice on the appropriateness or otherwise of a PPP. They coordinate PPP projects and ensure best practice; consistency of approach across projects; advice on realistic timetable and budgets; and guidance on financial, legal, management, and technical issues in PPPs based on their expertise. They also advice and inform relevant decision-making bodies in government on PPP progress (EPEC 2011, pp. 13–14). In South Africa, South African treasury depends on IRA to ascertain if provinces can meet the costs of PPPs based on their future budgets. It plays a central role in the development of PPPs in South Africa. The role of South African IRA starts from completion of feasibility study to the signing of the contract. It continues by inspecting the quality, affordability, and expected fiscal cost of PPPs and also guides the PPP process by ensuring that the contract it developed is followed (Sanghi et al. 2007; Dutz et al. 2006). These functions make independent regulatory agencies indispensable instruments for coordination and successful implementation of PPPs from the beginning to the end.

## Synonyms

Data and information; Evidences; Public statistics

## Introduction

Indicator is a measure, in general, quantitative, used to measure, approximate, or translate aspects of social, economic, or environmental reality or used to quantify the effort of allocating resources or producing goods and services by public/private organizations (United Nations 1989). Labor income, infant mortality rate, gross domestic product, and rate of forest deforestation are, in this sense, indicators as they translate into tangible and operational figures, relevant, specific, and dynamic dimensions of the reality that surrounds us. Hospital beds per thousand inhabitants, average daily caloric consumption, number of beneficiaries of social protection programs, percentage of households with access to basic sanitation are also examples of indicators, allowing to objectively estimate the availability of public/private goods/services in a given location. Like photographs, social, economic, and environmental indicators are approximate images of reality,

that is, they are simplified representations of it, the better the more specific the aspects of interest in portraying and the more reliable and accurate the information used to calculate the measurements. Like seismographs, policy or project indicators inform the dynamics of the actions triggered by the promoting agents and their potential effects.

Expressed as rates, indices, percentages or absolute data, indicators make up the information framework that Lindblom (1993) highlights in his analysis of the decision-making process in public policies in democratic contexts. Indicators reduce uncertainties, assist in the debate with society, subsidize decisions that are inexorably political with technical information. These data subsidize government planning activities in different spheres of government; they make it possible for the public authorities and civil society to monitor the living conditions and well-being improvement; they allow the deepening of academic research on changes in society and to investigate the determinants of the different phenomena that occur in it (Haupt and Kane 2000).

Building an indicator involves a complex methodological operation that begins with an effort to clarify or objectify the concept or public action of interest. Living conditions, labor productivity, environmental sustainability are examples of complex constructs that can only be "measured" if systematic efforts are done to decode them into simpler concepts. Likewise, it is not easier and immediate to propose indicators to implement and evaluate public programs for improving educational performance, encouraging technological innovation or sustainable exploitation of forests. The objectification of the concept and proposition of an indicator is an interactive process of concept-measurement: as soon as the social phenomenon – or public action – is proxied through preliminary versions of an indicator, its analyses and use allow us to evaluate its validity and go further into a new specification of concept – or action – and propose other possible "approximate measures," "proxies" or indicators (Neufville 1975).

With a concept – or action – better specified, one start to search for the information needed to build the indicators. For this purpose, information made available by statistical agencies, research centers, universities and government agencies are commonly used. These institutions carry out sample surveys and demographic censuses on the living conditions of the population, surveys and panels of economic conjuncture with companies, and research on the use of natural resources and the state of the environment. Public registers, public service records, government purchases, and management systems are other sources of relevant information to build indicators. For each country, these data can be gathered by internet tools or can be extracted from microdata files at the statistical agencies and government websites (such as www.ibge.gov.br or www.dados.gov.br in Brazil). International indicators on many subjects can be accessed at United Nations Statistical Division (http://data.un.org/) or at one of UN specialized agency, according to the main area of interest such as labor, education, health, food, and development (which links are accessible by the previous site).

It should be said that the available information in official databases or statistical surveys may not be suitable – in terms of conceptual specificity, periodicity, population coverage – as desired to compute the indicator that better "fits" the concept someone is interested in. If it is not possible to produce new data because of the cost and time needed to it, the computable indicator may still be useful as long as one knows its limitations in terms of validity in representing the original concept. The same idea applies if the information lacks the desired reliability. The better the efforts to produce consistent indicators, one should never forget that they are proxies of reality, not reality itself.

Besides the name and the computation method/formula, indicator metadata – its documented record – should also specify a more extended definition of the measure, the data sources used, geography and frequency it may the presented, and comments on its taxonomy and properties (WHO 2015). There are several ways to classify indicators such as the broad thematic field – economy, society, and environment – public policy programmatic sector – education, social protection, fiscal, health, labor indicators, etc. – program

implementation stage – context, input, output, outcome indicators – or policy cycle phase – diagnosis, monitoring, and evaluation indicators. Literature in area presents also several properties on indicators, such as validity – how close is the measure to the addressed concept – reliability – how confident are data used to compute it – coverage – how representative it is of a segment or the whole population – sensitiveness – how sensitive it is to change over time or due to public interventions – and intelligibility – how comprehensive it is to the main users of the indicator (Jannuzzi 2017).

## Indicators, Welfare State, and International Agenda

The emergence and improvement of the field of applied studies of social, economic, and environmental indicators are intrinsically linked to the structuring of the social welfare state and to the consolidation of public sector planning activities throughout the twentieth century (Desrosieres 1998). As economic indicators were first demanded – to measure international trade, economic production, and unemployment levels due to 1929 crisis – social measures appeared more recently, having gained technical-scientific body in the mid-1960s, in the attempts to organize more comprehensive systems to monitor social changes and gauge the impact of social policies around the world (Atkinson et al. 2005). The production of environment indicators became more common in the nineties, as ecological questions entered on public agenda.

There are certainly previous contributions to the construction of a conceptual framework on social indicators, such as the studies by sociologist Emile Durkheim in the first decades of the last century or even earlier, as suggested by Neufville (1975). She argues that although "social indicator" became the dominant term in the 1960s, "statistics" as a practice for quantifying social phenomena for public decision-making dates back to the seventeenth century, with the work of Englishman William Petty. But it was in the middle of the "thirty golden years of capitalism" that the indicators gain prominence. In the post-war period and in the following decade, there was great interest in proposing more complex economic indicators, framed in systems of national accounts, to produce better and international comparable estimates of gross domestic product (GDP). But, in several countries, despite the increase in GDP, high levels of poverty remained and social inequalities were accentuated. Economic growth proved to not a sufficient condition to guarantee social development (Carley 1985). In the now-developed countries, social indicators were needed to monitor social change and to evaluate the growing scope of public policies and government expenditure. The management of welfare state policies – on health, housing, labor, social assistance, education, etc. – demanded newer statistics to produce indicators to policy making, monitoring, and evaluation.

In this context, an immense conceptual and methodological effort was made to develop instruments for measuring well-being and social change in statistical agencies in different countries, under the auspices of multilateral institutions such as the United Nations Statistics Division (UNSD), the Organization for Economic Cooperation and Development (OECD), and the various other agencies of the United Nations System. The publication of the books "Social Indicators," by Bauer (1966), and "Toward a Social Report" (USA 1969), made by American government's order, represented important milestones in this process, inaugurating what would later be called, at the time, in the mid-1960s of "Movement of Social Indicators" (Miles 1985).

The development of indicators technical field was also stimulated by United Nations' 10-year development agendas. As Koehler (2016) observes, these agendas established by the United Nations Assembly proposed quantitative targets for economic growth and, gradually, broadened the scope to include measures of social welfare for the world and developing countries. In the second "Development Decade" of the United Nations, in the 1970s, besides the goals toward economic growth, it was included commitments for advances on employment, education, health, and nutrition policies. In the 1980s, the United

Nations began to focus the fight against hunger and poverty as fundamental objectives of the international agenda, and since then this commitment has not been withdrawn. The UN World Conferences in the 1990s, the publication of Human Development Reports, and other social reports organized by civil society organizations summed up to create a second "Indicators Movement." Proposals of newer indicators – in such news areas as cultural diversity, human rights, and environment – emerged during those ten world conferences concerning education (1990), childhood (1990), environment (1992), human rights (1993), population (1994), social development (1995), women (1995), human settlements (1996), youth (1998), and racial discrimination (2001).

Such efforts on public policy commitments – and therefore, on indicators – contributed to establish the Millennium Development Goals (MDG) agenda, that emerged from the "Millennium Summit" in 2000, in which leaders from 191 countries participated. However, reflecting the hegemonic liberal perspective on State role at that time in the world, the development agenda was reduced to a more modest set of commitments, frustrating the encouraging expectations of social progress that had been built in the past decades. Even though, the international and political legitimation of the agenda and the compromise to monitor the eight development goals represented a new impetus for the field of indicators in the world. It was necessary to produce and make available consistent indicators, on a regular basis, to monitor the progress over the years. Less developed countries were mobilized to improve their statistical system and produce social reports as a way to measure their performance on the commitments such as reducing extreme poverty in 2015 to half of that observed in 1990, universalizing primary education, eliminating gender gaps in access to education, or reducing childhood mortality to two-third of the prevailing in 1990 (Koehler 2016).

At the end of the 2000s, Stiglitz-Sen-Fitoussi Commission brought relevant contributions to the area, proposing new measures of economic performance, social progress, and sustainable development (Stiglitz et al. 2014). It might be said that the commission reports marked the beginning of the third wave of the "Indicators Movement." But the most eloquent evidence of this new movement – or its peak – would be configured with the proposal of more than 230 indicators to monitor the Sustainable Development Goals (SDG) agenda, in mid-2015. The SDG agenda enlarged the minimalist development perspective of the previous one, a frequent criticism of non-governmental organizations to the MDGs (Mertens 2016). After decades of predominance of liberal ideas in public management, SDG agenda brought back the relevance of State and broader public policies.

SDG agenda conceives development as a process that should simultaneously ensure economic growth, social inclusion, and environmental sustainability, a triad-concept discussed and validated during the 2012 International Conference on Sustainable Development in Rio de Janeiro (RIO + 20). So, it is a broader proposal, including all countries, dedicated to promote public policies and induce the private sector to achieve more than 160 commitments, gathered in 17 major objectives. If it is true that the effort to monitor the MDG agenda has left an important legacy of a minimum set of around 60 comparable international indicators, the enlarged commitments scope brings a challenging work agenda to statistical system all over the world. A quick examination of the 200 established indicators – of a set five times larger, when the discussions on the agenda started in 2010 – reveals that there are still many information gaps to be solved in the statistical systems, even to developed countries, specially on environment indicators.

Most of the countries have been working on SDG set of indicators as it can be seen, in Brazilian case, at its SDG platform (https://odsbrasil.gov.br/) The international progress toward this third Indicators Movement can be seen at SDG website (https://unstats.un.org/sdgs/).

## Indicators and the Public Policy Cycle

Public policies are information-intensive bodies. Policies are complex systems proposed to attend

collective needs or solve public problems. In order to do it, policies involve the proposal of regulation laws, universal coverage programs linked to redistributive ones in many sectorial areas. They are operated by agents at different government levels, with distinct management skills, to deliver several kinds of products, services, and cash transfers to diverse target groups in many places in the country (Subirats and Dente 2014). Thus, in such complexity, program design and implementation require many indicators to fill diagnosis studies, build monitoring systems, and subsidize results evaluation. In fact, indicators are indispensable inputs in all phases of the policy cycle, from formulation to evaluation (Jann and Wegrich 2007).

In order to promote a particular public issue on the priority policy agenda, the first stage of the policy cycle, it is necessary to have indicators that dimension and characterize the phenomenon. Indicators play a fundamental role in the objectification and dimensioning of latent collective issues in society that, properly vocalized, can enter into government's priority agenda. In this sense, indicators instrumentalize the demands of political parties, unions, employers' associations, the press, and other institutions. By modeling problems such as hunger, poverty, poor school performance, difficulties in accessing health services, drug addiction, violence, and several other inequities, the indicators contribute to the discussion of the priorities of the government and corporate agenda in the country (Jannuzzi 2016). The better these issues are dimensioned and characterized through structured information, the more arguments are provided to pressure groups, government, and society to discuss priorities and public budgetary allocation.

In the formulation of the public policy, indicators are needed to describe various themes of social reality. After all, it is necessary to have a multifaceted diagnosis about the living conditions to subsequently guide the design of the programs to be implemented. Good diagnostic indicators are characterized by the ability to explain the social issue or to discriminate against typical situations in which this issue manifests itself in population groups or territories, in a given period of time.

In the implementation phase, a monitoring set of indicators are needed. This set should be parsimonious and be organized as an input-output-outcome logic to allow monitoring program operations and its possible effects (McDavid and Hawthorn 2006). This monitoring framework makes possible to track how human, financial and physical resources are being used, how fast the products and services are being delivered and, finally, if possible, how programs are changing people lives. For this purpose, monitoring indicators should be sensitive to program activities and its deliveries and, of course, be available in regular basis.

In the evaluation stage, several indicators should be used in order to analyze to what extent the programmatic actions contributed to the mitigation of the collective problems pointed out in the diagnosis. Is it the time to have indicators that account for effectiveness (has the program met its objectives?), efficiency (have the resources been well used?), and impact (what are other effects generated by the program on beneficiaries and on society?). Indicators for evaluating purposes need to be specific and sensitive to their various programmatic components, to show effects – lack of effects or even defects – when there is reason to suspect that they have been produced (Rossi et al. 2004).

## The Political Nature of the Indicators

In technocratic circles, indicators are seen as a powerful resource to legitimize public policy decisions, due to the apparent impartiality they would hold (Porter 1996). In this sense, they confer political authority on those who do not directly hold it by vote or delegation. But, if it is a fact that indicators bring evidence to support political decisions, they do not have the power to refer them without question. As Miles (1985) warned a few decades ago, indicators cannot be understood as neutral instruments, free from ideological or political values. Indicators illuminate aspects that its proponents want to highlight, in the perspective that they consider relevant. There are always different interpretations that can be made about a

single set of indicators or even, alternative indicators can be proposed to defend a certain position or another, with greater or lesser analytical strength.

Like any technical resource, indicators can be used constructively or irresponsibly. They can inform or misinform. Good use generates relevant knowledge for analyzing social change or government action. Misuse or abuse produces misinformation or factoid, under apparent technical varnish. They can contribute to improving policies and programs or be employed to delegitimize them.

Social indicators, economic statistics, and environmental data are public goods; they are not divisible goods, in which consumption by some limits the use by others. So, their use should be encouraged and subsidized. The more intense they are used by public institutions, private companies, and civil society, better the benefits for all in forming consensus on how to face collective demands and to improve well-being.

# Inequality in Income and Wealth in Russia

Daria Popova[1,2] and Alexey Rudberg[2]
[1]Institute for Social and Economic Research, University of Essex, Colchester, Essex, UK
[2]Institute for Social Policy, National Research University-Higher School of Economics, Moscow, Russia

## Synonyms

Economic inequality; Income and wealth disparities; Unequal distribution of income and wealth

Support of the Basic Research Program of the National Research University – Higher School of Economics is gratefully acknowledged by the authors.

## Definition

The extent to which income and wealth is distributed in an uneven manner among a population.

## Introduction

In the later decade Russia continued progress in terms of economic growth and lowering poverty. The per capita Gross National Income (GNI) in Russia was last recorded in 2015 at 23,770 dollars per year (in 2011 PPP), comparable to that of Latvia, Poland, Hungary, or Chile (IBRD/WB 2017). Yet Russia was much less successful in reducing inequality which skyrocketed after the market liberalization reforms in the early 1990s. Currently inequality in Russia has stabilized at the level which is significantly above the OECD average: the average Gini coefficient (The Gini index is the most widely used summary measure of inequality in income distribution based on a Lorenz curve. It measures the extent to which the distribution of income among individuals or households within an economy deviates from a perfectly equal distribution. A Gini index of 0 represents perfect equality and 1, perfect inequality.) for the OECD countries in 2014 was 0.318, while it was 0.416 in Russia (OECD 2017). Current macroeconomic environment with continuous recession, which started in 2014 and massive terms of trade shock due to collapse of oil prices, threatens to reverse Russia's substantial achievements in terms of raising incomes of the population and reducing poverty.

This chapter aims to provide a comprehensive analysis of income and wealth inequality in Russia and the impact of the current crisis. The focus throughout the chapter is on the national distribution of income and wealth. Income refers to money received from employment, investments, such as interest on savings accounts and dividends from shares of stock, rent, savings, pensions, social benefits. Wealth refers to the total amount of assets owned, including financial assets and property. Income and wealth are typically measured at the household level to account for intra-household redistribution of resources. In all societies, including Russia, there are many other types of inequality (e.g., in political power, social status, access to education, and basic citizenship rights), and some may be more consequential than income and wealth disparities in terms of their impact on well-being of the citizens. However, in market economies income and wealth serve as good predictors of well-being in other domains, such as social inclusion, education, health, etc.

## Trends in Income Inequality

Russia is one of the post-socialist countries that underwent the hardest economic recession in the 1990s (Fig. 1) alongside an abrupt increase in income and earnings inequality. It was expected that the transition from a planned economy to a market economy would lead to an increase in income inequality because of the collapse of ideological barriers that constrained wage and income disparities (Milanovic 1999). A long period of economic downturn, which in its final stage overlapped with the global financial crisis, ended in the default in 1998. After that a period of quick recovery and economic upturn followed, caused mainly by growth in the global commodity prices. In terms of overall growth, between 1999 and 2014, increases in Gross Domestic Product (GDP) averaged 4.65% a year. During this period the positive trend was only interrupted by the 2008–2009 crisis (when GDP declined by around 7.8%), after which growth quickly resumed and continued until 2014. The current recession started in the fourth quarter of 2014 and deepened in 2015, driven by the sharp fall in the terms of trade (as oil prices dropped) and economic sanctions. Fiscal support for incomes was more limited than in the aftermath of the 2008/09 global financial crisis, due to the tight budget situation as oil revenues fell. A further contraction in real GDP (by 1.9%) in 2016 and low real growth of 1.1% in 2017 is projected (IBRD/WB 2016).

Income inequality in Russia, on the other hand, has not bounced back after a period of sharp growth in the early 1990s and only stabilized towards the second decade of the twenty first century at a very high level. In 2014 the average

**Inequality in Income and Wealth in Russia, Fig. 1** Russia: Changes in GDP, real disposable income per capita and income inequality (Note: Income data is for December of the relevant year. Real incomes are calculated by adjusting nominal incomes using the Consumer Price Index (CPI). (Source: Authors' calculations based on Rosstat data (http://www.gks.ru/)))

Gini index for the OECD countries amounted to 0.313, while it was 0.416 in Russia (OECD 2017). As shown in Fig. 2, high level of income inequality is not an inevitable attribute to a certain stage of economic development and is weakly correlated with the size of national wealth (measured by GDP per capita in PPP terms). Several post-socialist countries with per capita GDP similar to Russia's (e.g., Hungary, Poland, Latvia) maintain a much lower level of income disparities. Russia falls into the group of countries with the highest level of inequality by OECD standards (Gini index of 0.400 and above). Besides Russia this group includes only developing countries (Mexico, Chile, Turkey).

Given the magnitude of income disparities observed in Russia, the dynamics of mean income is close to the dynamics of the fourth quintile of income distribution (Fig. 3). Real incomes of the fourth quintile and of the population on average have doubled between 1991 (the last pre-reform year) and 2013. Yet three bottom quintiles (or 60% of the Russian population) have seen a considerably smaller growth in their income. The third quintile has restored its pre-reform income level just in 2005, two years later than the fourth quintile, the second quintile – in 2008, while the bottom quintile's income has never reached the pre-reform level. In contrast, incomes of the top income quintile have tripled between 1991 and 2013. All in all, this shows that the economic growth in Russia has not been sufficiently inclusive. Between 2013 and 2015, however, it was the top quintile that experienced the highest reduction in disposable income. At the same time, Gini index for disposable income has declined from 0.419 to 0.412. Therefore the downward trend in income inequality in 2013–2015 can be attributed to the reduction in incomes of the better-off which were more likely to experience higher losses due to the depreciation of the national currency beginning in the second half of 2014.

Income inequality is closely related to earnings inequality because labor incomes – earnings and entrepreneurial income – are the most important income source for the population. They account for a half of GDP and for almost 80% of the population income. It is worth noting that the trend in earnings inequality in Russia differed from the trend in income inequality (Fig. 1).

**Inequality in Income and Wealth in Russia, Fig. 2** Russia: GDP per capita and Gini index in OECD countries and Russia, 2014 or latest year (Notes: Gini indices for OECD countries are calculated for household disposable income equivalized using the square root equivalence scale. Gini index for Russia is taken from the national statistics which uses per capita income estimates. (Source: Authors' calculations based on Federal State Statistics Service (Rosstat) data (via http://www.gks.ru/), OECD Income Distribution Database (2017) (via http://oe.cd/idd)))

**Inequality in Income and Wealth in Russia, Fig. 3** Russia: Dynamics of real mean income by quintile groups (1991 = 100%). (Source: Authors' calculations based on Rosstat data, http://www.gks.ru/)

Between 1991 and 2001 the Gini index for earnings has grown from 0.317 to 0.508, but later on, wage inequality showed a steady reduction. Starting from 2009 Gini coefficients for earnings and for disposable income were approximately at the same level. Much of the decrease in wage

inequality since 2002 was pushed by a compression at the bottom of the wage distribution (Calvo et al. 2015). This was caused by structural changes – a significant shift of labor toward better pay jobs, in particular the reallocation of workers from agriculture and manufacturing to the service sector where wages are higher. The government interventions have also played an important role. Those included several increases in the minimum wage (especially, in 2001 and 2009) and in the salaries of public sector employees in education, health, culture, and social care sectors (starting from 2012).

Most likely, the persistence of income inequality together with the reductions in earnings inequality can be explained by the *unreported earnings* that are imputed and included as an element of total population income in National Accounts. (This refers to something other than 'hidden' or illegal economies (such as related to tax fraud or evasion, or illegal activities). The non-observed economy also comprises activities not related with criminality or tax evasion, but that still remain unobserved because the traditional survey tools are not perfect (non-response, underreporting, short income reference period, etc.) and business registers are not always complete and up-to-date.) Prior to 2014, the share of unreported earnings was estimated at 40% of official (declared) earnings or 25% of the population income. In 2014 due to changes in the data collection method, the share of unreported earnings was at 15% of the population income. Rosstat uses income data from National Accounts to adjust the original inequality estimates derived from Household Budget Survey (HBS). This is done mainly because of the problem of unit nonresponse in HBS. According to various estimates, the HBS sample does not cover from 5 to 10% of the Russian population, including the poorest, and – especially – the richest households. The welfare aggregate derived from HBS is statistically manipulated to match macrolevel estimates of income using a lognormality assumption. Due to this adjustment the mean income and inequality indices in National Accounts are considerably higher than those derived directly from HBS. In addition, while computing inequality indices, Rosstat does not do any adjustments for the economies of scale in household consumption (In order to make correct comparisons of the standard of living of households of different size and composition, the household income needs to be bought to some common denominator. The most simple method of adjustment is to convert the household income to a per capita basis. This method, however, ignores the impact of household economies of scale due to living together (e.g., sharing a house), as well as differences in needs of people with different demographic characteristics (e.g., age, sex, marital status, and employment status). Therefore, the household income is typically adjusted using an equivalence scale, i.e., a measure of the cost of living of a household of a given size and demographic composition relative to the cost of living of a reference household (usually a single adult).) or for the inter-regional differences in the cost of living. While this does not have impact on poverty estimates (since the national poverty thresholds are differentiated according to an individual's sex, age, and region of residence), ignoring these aspects while computing inequality leads to an additional bias in inequality estimates produced by Rosstat. At the same time, inequality indices derived from independent household surveys cannot be considered fully reliable either, due to high nonresponse rates, low sample sizes, and a gradual shift of the sampling frame towards poorer households.

## Trends in Wealth Inequality

The existing composition of household wealth in Russia, where the share of nonfinancial assets significantly exceeds the share of net financial assets, runs contrary to the wealth composition in other European countries. The root causes to this are twofold: on the one hand, there are historical reasons for the prevalence of nonfinancial assets in accumulated wealth; at the same time, Russia's turbulent transition period to a market economy in the 1990s and the exchange rate fluctuations in the late 1990s and early 2000s undermined public confidence in existing financial institutions and domestic currency, further driving wealth to nonfinancial assets.

Prior to late 1980s, the Soviet government did not officially allow the private ownership of real estate. However, since 1958 it was possible for families to acquire and "semi-own" real estate – the organization of housing cooperatives allowed families to purchase apartments in existing or future housing projects, which could be in the future, under certain conditions, sold, traded, or passed down to offspring. These housing cooperatives were generally organized by workers associations, so only employed individuals had access to these opportunities. Following the 1991, the government launched the process of voluntary privatization of all household dwellings, which had been acquired either via housing cooperatives or provided as part of the social housing program. This allowed households to complete the transfer of ownership of their main dwellings from public to private. This privatization process officially created the main nonfinancial component of household wealth in the Russian Federation. By the end of 2014, 79% of all eligible dwellings have been privatized.

In terms of financial assets, the USSR Savings Bank (later Sberbank) provided the population with the opportunity to deposit any existing savings, guaranteeing safekeeping and providing a moderate interest. By 1992, over 40 million people had existing savings in the country's main bank. However, the hyperinflation of the early 1990s and the 1998 financial crisis virtually wiped out any savings the Russian population had accumulated over the years, and the rapid devaluation of the Russian ruble drove households to convert their savings to other currencies (mainly the USD) and keep them far away from the still developing banking system. There was a similar distrust of the stock exchanges that had been created in the early 1990s. The economic boom of the mid 2000s, which saw household earnings increase, created a situation where public distrust of financial institutions was still present, but it was no longer feasible to continue to keep savings on hand. This further drove wealth accumulation to nonfinancial assets, where the middle-class would purchase additional housing as a form of safekeeping their newly acquired wealth.

The privatization process of the early 1990s also included the transfer of government-owned enterprises to private ownership. The result was that the existing managers of then state-owned enterprises managed to acquire complete ownership of the majority of government assets, forming a new class of highly wealthy individuals. Undoubtedly the accumulation of wealth of the entire country into the hands of the elite few over a short period of time has made Russia one of the world leaders in terms of wealth inequality. Yet the correct assessment of the degree of wealth inequality in the Russian Federation is a nontrivial task due to a lack of complete tax register data. Therefore the existing estimates of wealth and wealth distribution are rather approximations that rely on national household balance sheets (This refers to the household balance sheets published by national statistics offices or central banks, which generally use National Accounts and microdata from income and wealth surveys to estimate the total value of net financial assets of households.), household survey data, and other statistics that are readily available to researchers. Several international financial and research institutions publish annual global wealth reports with per-country specific estimates, but their estimates of mean wealth and the scale of inequality in Russia lack consistency.

The 2016 Allianz SE Global Wealth Report (Brandmeir et al. 2016), which only examines the financial component of wealth, estimates the net and gross financial assets per capita in the Russian Federation at 3086 and 5592 USD, respectively (fixed exchange rate at the end of 2015). The distribution of total net financial assets has a Gini coefficient of 0.68. This identifies the Russian Federation as a country with a higher than average level of inequality, with Slovakia having the lowest level of net financial assets inequality with a Gini of 0.44 and the USA having the highest level of inequality with a Gini coefficient of 0.81. The 2016 Credit Suisse Global Wealth Report (Shorrocks et al. 2016) estimates total wealth, including the value of nonfinancial assets and puts the mean wealth per adult (20 years and older) at 10,344 USD (fixed exchange rate in 2016), with mean net and gross financial assets

at 161 and 4233 USD, respectively, and mean nonfinancial assets at 10,183 USD. The Gini coefficient of the total wealth distribution is estimated to be 0.923 in 2016. In comparison, in 2016 Slovakia had a Gini coefficient of 0.49 and the USA had a Gini coefficient of 0.862. Throughout the years, the Russian Federation has been the leader of wealth inequality according to Credit Suisse, having the highest Gini coefficient for wealth in 2013 and the second highest in 2014. The 2016 Capgemini New World Wealth Report (Capgemini 2016) identifies the Russian Federation as the country with the highest level of wealth inequality, with 26% of the country's wealth being held by individuals whose wealth exceeds one billion USD. Sixty-two percent of the country's wealth is in the hands of USD millionaires according to the report. According to a study by Guriev and Rachinsky (2006), while average wealth and wealth inequality in Russia have certainly been increasing, the lack of reliable data limits the reliability of any estimates of the magnitude in the changes.

Among the above-mentioned studies, the Credit Suisse reports provide the most detailed account of the methodology employed in the estimation approach to country wealth analysis and can serve as an illustration of the general approach to wealth estimation today and highlight potential caveats. In broad terms, calculation of total wealth requires estimation of the value of both net financial assets and nonfinancial assets. An analysis of wealth inequality requires some measure of the distribution of wealth among individuals. Credit Suisse relies on the Household Balance Sheets provided by the UniCredit financial institution to estimate the value of financial assets in the Russian Federation. The total debt holdings and value of nonfinancial assets are derived from regression estimates of developed countries that collect wealth data directly. This regression technique is not always reliable, especially in the analysis of the value of nonfinancial assets. For the Russian Federation, where an overwhelming share of total wealth is held in nonfinancial assets, this unreliability of estimates has a significant effect on the estimate of total wealth. In fact, the 2014 Credit Suisse report (Stierli et al. 2014) doubled the value of nonfinancial assets post hoc for all previous years in response to criticism of undervaluing total wealth in Russia.

In estimating the distribution of wealth, Credit Suisse relies on the distribution of income. After having identified the relationship between the income and wealth distributions within countries that provide direct data on both, the initial wealth distribution is then derived from the existing income distribution in a country. This estimated wealth distribution is further adjusted by the data available in the Forbes list of the richest 400 people, to account for high wealth individuals that are more than likely to be excluded from income distributions based on household budget surveys, and by result, from the initially derived wealth distribution. It is important to note that this approach to wealth analysis, developed by Davies et al. (2011), was initially intended to estimate global wealth and the global wealth inequality. As long as the estimates of wealth in the richest countries and countries with a high population are adequate, poor quality of data in a single country will not significantly affect the results. However, per-country analysis is very much dependent on the quality of data available.

As stated above, Credit Suisse employs UniCredit data to estimate the value of financial assets and regression estimates to calculate total debt. Allianz SE estimates the value of financial assets to be more than double than that of UniCredit, which should not be seen as an endorsement of their estimation technique, but as a highlight of the unreliability of estimates, even those that are based on the most up-to-date data. Given that Credit Suisse estimates the wealth distribution from the distribution of income, the validity of their results depends in part on the quality of the income distribution data. Credit Suisse uses the UNU-WIDER World Income Inequality Database (WIID) (UNU-WIDER 2017) for country-specific income distributions. Up until 2008, the only available estimate of the income distribution in the Russian Federation was from the National Survey of Living Conditions and Access to Social Services (NOBUS), carried out by the World Bank and Rosstat in 2003 using a sample of 55,000 households. Given the

significant changes to the income and poverty levels that have occurred in the Russian Federation since 2003, the validity of the Credit Suisse estimates, which are based on out-of-date household survey data, is highly questionable. By basing the initial wealth distribution on these income distributions, the authors ignore any positive adjustments that have occurred in the income distribution since that time, attributing the majority of wealth increase to a further consolidation of wealth among the rich elite, which results in a constantly growing Gini coefficient. The sensitivity of wealth estimates to the current exchange rate which in Russia's case has been fluctuating since the end of 2014 and in theory should not directly affect wealth inequality, in practice only furthers wealth consolidation. In early 2017, the WIID was updated to provide income distribution data up to 2013 (based on the annual RLMS-HSE surveys, covering approximately 7000 households), and these updated distributions can hopefully be employed in future estimation of wealth and wealth inequality in the Russian Federation.

## The Distributional Impact of Government Policies

Since the mid-2000s, the Russian welfare state has been expanding, due to high commodity prices which greatly increased the budgetary capacities of the state, and also due to the 'populist' strategies adopted by the Russian authorities, in order to secure the political support of the population (Cerami 2009; Cook 2010). The measures undertaken by the government included a series of increases in earnings of the public sector workers, the minimum wage and the average and minimum pension benefits. There were few attempts to improve the redistributive capacity of the tax-benefit system beyond the increases in pensions, with the exception of measures targeted at promotion of fertility (Ovcharova et al. 2007).

The contemporary Russian welfare system represents a hybrid of a state socialist and neoliberal welfare regimes (Lustig et al. in print). Childcare, education, and healthcare remain to a large extent public and free at the point of use, but there are user fees for services beyond the basic coverage, and informal payments are still quite widespread in healthcare. The system of social transfers continues to be dominated by pensions and categorical benefits which are mainly targeted at pensioners, despite attempts to reduce the number of eligible people by introducing means-testing procedures. A large share of the population is covered by one or another type of government transfers, but the amounts of the majority of cash benefits do not reach the minimum subsistence level.

The estimates of progressivity and the distributional impact of the main elements of the tax-benefit system in Russia are shown in Fig. 4. Progressivity refers to the degree to which tax burdens and benefit entitlements rise or fall with household income. The summary measure of progressivity is the Kakwani index. (The Kakwani index uses the Gini framework to measure how progressive a social transfer or tax is. It is equal to the difference between the Gini index for incomes before the social transfer and the Gini concentration index for the social transfer. In case of taxes, Kakwani index is equal to the Gini concentration index for the tax minus the Gini index for pre-tax incomes. Theoretically, the Kakwani index can vary between −1 and 1; the larger the index is, the more progressive is the social transfer or the tax.) The distributional impact of a tax or a transfer is measured as the marginal reduction in inequality due to the tax or the transfer, i.e., the absolute or relative change in Gini index due to a removal of the transfer or the tax from household income. Therefore, a positive value indicates that a tax or a transfer contributes to a decline in inequality. Overall, the inequality reduction due to the tax-benefit system in Russia in 2014 amounted to 0.18 Gini points or 38% (Popova et al. 2017). This is the total value by which market income inequality is reduced due to direct and indirect taxes and transfers and transfers in-kind, such as public education and healthcare.

Most of the inequality reduction in Russia comes through direct transfers, which reduce the market income Gini by 0.145 points or 31%.

**Inequality in Income and Wealth in Russia, Fig. 4** Russia: Progressivity and impact of main components of tax-benefit system on inequality in 2014 (Notes: Distributional impact is defined as the difference between Gini for *market income* and Gini for *final income* (i.e., market income minus direct and indirect taxes and SIC, plus direct and indirect transfers, plus imputed value of public services), expressed as a percentage of *market income* Gini. Contributory pensions are included in direct transfers but also shown separately to highlight their impact. (Source: Popova et al. 2017))

Contributory pensions (which are included in direct transfers but also shown separately) are highly progressive (with Kakwani index of 0.8) and basically play the prevailing role in inequality reduction. Given the flat rate personal income tax (PIT) and regressive personal property taxes, direct taxes in Russia are mildly progressive. Social insurance contributions (SIC) are also somewhat progressive, despite the regressive tax schedule, as contributions are paid only by formal sector workers who tend to earn more than informal sector workers who do not pay, on average social security contributions. Direct taxes and SIC contribute to a slight decline in inequality. Indirect taxes – VAT and excise – are slightly regressive, as in many other countries, and hence contribute to an increase in inequality. The overall impact of the tax system on inequality in Russia is negligible. In-kind transfers, i.e., education and health services, are progressive and reduce the market income Gini by 0.034 points.

The distribution by decile shows that there is almost linear progressivity in the Russian tax-benefit system (Fig. 5). The bottom six deciles are net beneficiaries from the system if in-kind health and education services are included, and the bottom four deciles are net beneficiaries if only cash transfers and taxes are considered. The top four deciles are net payers to the system. The flat tax system limits the redistribution through the fiscal system: the richer seventh to tenth deciles pay a similar share of income (around 30%) in PIT and social security contributions. Government transfers (mostly pensions) dominate incomes for the lower income deciles.

In relative terms, Russia achieves a very moderate reduction in inequality through net direct taxes, compared to the majority of European Union (EU) countries (Fig. 6). In Russia, the system of direct taxes and transfers reduced market income Gini by 31.2% in 2014, while on average in EU-28 the reduction in market income inequality was equal to 41.8%. This assessment assumes that pensions are government transfers rather than deferred income. The structure of taxes and benefits can differ, but where there is a large reduction in inequality due to fiscal policy, there generally is a broad mix of redistributional benefits and taxes. Apart from pensions, none of the components of the system of direct transfers and taxes appears to have a large impact on inequality in Russia.

As shown in Fig. 7, depending on the treatment of contributory pensions, the fiscal system of Russia can look more redistributive than that of

**Inequality in Income and Wealth in Russia, Fig. 5** Russia: Distributional impact of different components of the tax-benefit system in 2014 by pre-fiscal deciles, in percent of disposable income (Notes: Distributional impact is defined as the difference between Gini for *market income* and Gini for *post-fiscal income* (i.e., market income minus direct and indirect taxes and SIC, plus direct and indirect transfers), expressed as a percentage of *market income* Gini. The contribution of various components of income is estimated by recalculating the *consumable income* inequality after subtracting each of the income components. (Source: Popova et al. 2017)

**Inequality in Income and Wealth in Russia, Fig. 6** Distributional impact of direct taxes and transfers in the European Union and Russia, 2014 (Notes: Distributional impact is defined as the difference between Gini for *market income* and Gini for *disposable income* (i.e., market income plus direct transfers minus direct taxes and SIC), expressed as a percentage of *market income* Gini. The contribution of various components of income is estimated by recalculating the *disposable income* inequality after subtracting each of the income components. (Sources: For Russia – Popova et al. (2017); for EU countries – EUROMOD Webstatistics for version G4.0 (2017) (via https://www.euromod.ac.uk/using-euromod/statistics)))

**Inequality in Income and Wealth in Russia, Fig. 7** Distributional impact of different components of the tax-benefit system in Brasil, United States and Russia, circa 2010, in percent of market income (Notes: Distributional impact is defined as the difference between Gini for *market incomes* and Gini for *disposable income* (i.e., market income plus direct transfers minus direct taxes and SIC), Gini for *post-fiscal income* (i.e., disposable income plus indirect subsidies minus indirect taxes), and Gini for *final income* (i.e., post-fiscal income plus imputed value of public services), expressed as a percentage of *market income* Gini. Contributory pensions are either treated as deferred income (while pension SIC are treated as savings) or as direct transfers (while pension SIC are treated as a tax)). (Sources: For Russia – Lustig et al. (in print); for Brazil and United States – Higgins et al. (2016))

the United States or less redistributive as that of Brazil. In the former case, contributory pensions are included in direct transfers; in the latter case, they are treated as part of market income.

Finally, the extremely unequal distribution of income and wealth in Russia calls for the introduction of tax measures targeted at the richest groups of the population, such as personal property and luxury taxes, which are practically nonexistent in Russia. Recently some attempts to move in this direction have been made by the government, albeit on a very modest scale. The amendments to the existing legislation introduced in 2014, include the higher tax rates on luxury cars and real estate. Privately owned real estate is often the only major source of wealth for poor and middle-class households in Russia, due to their low confidence in the banking sector. Rich individuals prefer to own several high-value apartments in the nation's capital as a way to diversify their wealth portfolios. In light of this, the government has decided to adjust over a period of five years the tax base of real estate to more accurately reflect the market value of existing properties. By 2017, more than half of Russia's 85 regions have switched to calculating the tax liabilities according to the new tax base. However, until 2019 the real estate tax liabilities are discounted by a linear adjustment coefficient. It is expected that by 2019 all individuals will begin to pay the full tax rate on privately owned real estate. (The tax rate has been set at 0.1–2% for privately owned real estate and is differentiated according to the estimated cost of the property.) The distributional consequences of this reform are yet to be estimated.

## Conclusion

This chapter has summarized the main trends in income and wealth inequality in Russia over the years since the beginning of the market transition in early 1990s up to the current economic crisis which started in the second half of 2014. In addition, we have assessed trends in the underlying factors of income inequality – the changes in the distribution of earnings and the impact of taxes and social spending programs.

Russia experienced sustained significant growth and poverty reduction during the past decade. At the same time, income inequality

which had increased significantly after the market transition in the early 1990s, stabilized in the 2000s at a very high level by international standards (Gini index of 0.420). The conjunctural economic growth in Russia, which was not supported by an equal growth in labor productivity, inhibited the government attempts to reduce inequality by means of income redistribution, in spite of a substantial reduction in wage inequality. Income inequality in Russia has declined in 2014–2015 due to higher losses experienced by the top quintile after the depreciation of the national currency in the half of 2014.

As far as wealth inequality is concerned, the Russian Federation has been claimed to be among the world leaders of wealth inequality according to the Credit Suisse Wealth Report, having the highest Gini coefficient for wealth in 2013 and the second highest in 2014. The Gini coefficient of the total wealth distribution is estimated at 0.923 in 2016. While there is no doubt about the high level of wealth inequality in Russia, in practice it is difficult to estimate the magnitude of this inequality reliably due to poor quality of data, as well as outdated microdata that had been used to produce the above-mentioned estimates. Nevertheless, efforts to improve direct data availability and transparency are welcome, as they will allow a more detailed analysis of the wealth trends in Russia.

Overall, Russia achieves a modest reduction in inequality through fiscal policy. The fiscal system of Russia has a significantly smaller impact on income inequality compared to the majority of European Union economies but achieves a comparable reduction in inequality as that in the United States. This assumes that contributory pensions are considered government transfers (rather than deferred income) and social insurance contributions are considered taxes. Most redistribution due to fiscal policy in Russia occurs through pensions. Major limits on the redistributive effect of fiscal policy include the large share of tax revenues that come from (regressive) indirect taxes, the neutral impact of personal income taxes, and the low share of spending on social transfers, in particular social assistance targeted to low-income groups.

# Inequality in Organizations

Dean Rockwell
Boston College, Boston, MA, USA

## Synonyms

Discrimination; Diversity; Retention; Selection

## Definition

Inequality in organizations refers to the degree that people are treated differently within organizations and the mechanisms that account for this differential treatment.

## Introduction

Inequality is an inherent part of the social world. Individuals are not born with the same characteristics and form social groups that are differentiated along different dimensions. Philosophers have long grappled with on how to distribute resources in society in a way that serves as many individuals as possible. This article focuses specifically on how inequality manifests *within organizations*, describing processes that create and maintain inequality as well as interventions that seek to mitigate it. The focus will be on gender, racial, and social class inequality and end with a short discussion of wage inequality. Inequality in organizations can be understood from both a social-psychological perspective (focusing on individuals within organizations) and a sociological perspective (focusing on organizational mechanisms). This short essay will cover (1) how organizational selection and retention can create inequality, (2) how organizational processes perpetuate inequality, (3) how organizations have tried to mitigate it, and (4) future societal challenges.

## Organizational Selection

Inequality carries a negative connotation in many academic circles. Without this negative connotation, inequality simply refers to a difference in size, degree, or circumstances. In this sense, all organizations contain inequality, because they contain variation. Inequality can carry a negative connotation when an organization discriminates against an individual on the basis of gender, skin color, or upbringing (among other factors outside of their control) rather than evaluating them on skills or merit.

People with certain demographic characteristics (race, gender) are more likely to be selected over others in organizations in part because of cognitive limits of the individuals doing the hiring. Individuals make sense of the world is by using cognitive shortcuts such as stereotypes to categorize information. If black people are given the stereotype of "lazy" and women of "too emotional," these candidates will appear worse in a hiring process than their white male peers who might be stereotyped as "competent" or "strong leaders." Racial- and gender-based selection in organizations comes about when categories are activated during the selection process. For example, when resumes are sent to employers with common white names and common black names, the white names are more likely to get callbacks from the employer (Bertrand and Mullainathan 2004). These findings also hold for speech patterns, where discrimination was found after interactions on the telephone (Massey and Lundy 2001).

Inequality in selection can also happen when companies encourage employees to refer people in their networks and who "fit" culturally into the organization. This can result in hiring that is biased toward the existing majority in the organization. In a study of prestigious professional service firms, it was found that candidates from economically privileged backgrounds were

preferred over other candidates because of how employers thought about talent and what "the right stuff" consisted of (Rivera 2012). Factors such as where candidates went to elite private high schools, what sports they did, and their extracurricular interests impacted the cognitive evaluation of the candidates (Rivera 2012). Cultural similarity also produced affective boosts which could overshadow the evaluation of skills (Rivera 2012).

Inequality manifests not only during the initial contact with candidates but also during the negotiation of salary. Studies have shown that women do not negotiate as well as men. Men are more likely to initiate salary negotiations, and even when women do negotiate, they ask for about 30% less money than men (Babcock and Laschever 2009). One explanation for this disparity is that women are perceived as less competent than men. This may impact their own confidence in negotiating as well as enhancing the self-confidence of men they are negotiating with. Men have been found to be overconfident relative to their abilities and women underconfident (Kay and Shipman 2014). Part of the explanation for this is that women are penalized for being overconfident in the workplace as they may be called bossy (or worse). Feminists have critiqued negotiations themselves as overly competitive, individualistic, and transactional (Bowles and McGinn 2008).

## Organizational Retention

After individuals have been hired into an organization, they often need to fit in with the organizational culture if they want to retain their jobs. Most organizations contain different subgroups, and boundaries are regularly being negotiated to determine who fits and who does not. Individuals are judged on surface-level attributes as well as internal attributes. Similarity/attraction theory posits that we select members into our groups who are similar to us. Individuals who are not judged as similar will experience greater stress, lower job satisfaction, lower performance, and higher turnover. Those in organizations who do not fit in are often filtered out of the organization. This is especially problematic when powerful subgroups of the organization define themselves according to gender, race, or socioeconomic status.

Another way that inequality is perpetuated within organizations is through collective myths that rationalize it. Social dominance theory describes two legitimizing myths or "consensually held values, attitudes, beliefs, stereotypes and cultural ideologies" that shape our relations (Pratto et al. 2006). The first type of myth is the hierarchy-enhancing legitimizing myth, which communicates that it is appropriate, natural, and moral to perpetual inequality. The other myth is the counter to this; it is the hierarchy-attenuating legitimizing myth, which is often inclusive and egalitarian. At the individual level, researchers have studied the construct of "social dominance orientation," which refers to whether the individual identifies more with hierarchy-enhancing legitimizing myths or hierarchy-attenuating legitimizing myths. This orientation predicts how much an individual will discriminate in job allocation decisions (Michinov et al. 2005) and resource allocation decisions (Pratto et al. 1994). Similarity/attraction and hierarchy-enhancing myths stack the deck against marginalized groups when it comes to organizational retention.

## Organizational Processes

In addition to social-psychological processes that affect hiring and promotion, the structure of organizations can perpetuate inequality. Organizations are different than individuals when it comes to discrimination as they have a much wider reach, can span multiple generations, and can make individuals feel exempt from personal responsibility given the legitimacy of the organization (Pratto et al. 2006). Certain organizations are more hierarchical (profit-maximizing financial institutions, transnational corporations, criminal justice systems), while others are less hierarchical (social services for marginalized populations, religious organizations devoted to the poor) (Sidanius and Pratto 2001). Organizations with steep hierarchies

are more likely to perpetuate inequality (Acker 2006). Other organizations that are not explicitly hierarchical also encounter challenges with respect to inequality, and even organizations with explicitly egalitarian goals develop inequalities over time (Acker 2006; Ferree and Martin 1995).

Although discrimination is perpetuated by individuals, it persists in organizations due to several mechanisms. One is isomorphism or the tendency for organizations in a given field to copy one another in order to secure legitimacy (Meyer and Rowan 1977). If hiring practices (that happen to be discriminatory) are widely accepted in a field, it is likely that most of the organizations in the field will adopt these practices. Isomorphism does not necessarily create inequality but results in the spread of practices and policies, making it more difficult for an organization to stand against the crowd. Organizations are likely to perpetuate discrimination if the practices in the wider field are discriminatory. Isomorphism and the need to secure legitimacy help to explain why organizations would feel pressure to adopt these practices.

Once practices are adopted by an organization, it is difficult for an organization to change. The organization makes financial investments, and people learn a particular way of doing things. Organizational routines and processes might result from the founder of the organization and the wider environment at the time of founding. Even if this wider environment changes, the organization may be slow to adjust, given inertia. Standardization and evaluation are also mechanisms that can produce inequality because they determine what kinds of actions within an organization are legitimate (Lamont et al. 2014). Bureaucracies operate by impersonal "neutral" rules, yet these rules often include built-in inequalities (Weber 1978). Organizations create routines that help to perpetuate inequalities long after particularly discriminatory individuals leave the organization. Routines are stable patterns of action that are developed to coordinate activities. Routines can perpetuate inequality because they are completed in a largely unconscious way and rarely change. They are difficult to critique and shape according to individual differences. They lie outside of the individual, and thus it is the individuals who need to conform to the organizational routine. More recently, routines have been conceptualized as capable of change – individuals in organization make tweaks and adjustments to routines as situations change (Feldman and Pentland 2003). Routines may be more flexible than initially conceptualized, which could mitigate the perpetuation of inequality.

## Organizational Efforts to Reduce Inequality

The literature on inequality in organizations has documented the efficacy of change initiatives meant to reduce inequality. One way to mitigate inequality in hiring would be to remove applicant information that signifies sex, race, or social class. One way of testing whether this works was a study on the impact that using blind auditions in symphony orchestra hiring had on sex-biased hiring (Goldin and Rouse 1997). In 1970, women accounted for less than 5% of the players in symphony orchestras. Orchestras adopted blind auditions in the 1970s and 1980s, and by the mid-1990s, women made up 25% of players (Goldin and Rouse 1997). The study found that the blind audition increased (by 50%) the probability that a woman would be advanced out of preliminary rounds. It also found that the blind auditions increased the likelihood that female contestants would be the winner in the final round (Goldin and Rouse 1997). Although this may not be feasible in many contexts, other steps could be taken (such as removing the name from the top of the resume).

Psychological interventions have also demonstrated efficacy in helping to offset inequalities in organizations. Researchers have found compelling evidence that using value affirmations (to improve African American student grades) not only benefit the individuals but also their peers who were not given the intervention (Powers et al. 2015). Organizational behavior researchers have conducted these kinds of interventions (affirming the abilities of individuals) with new hires and found that it dramatically

reduced stress and burnout (Cable et al. 2015). In the negotiation literature, when women are informed of how gender stereotypes favor men in negotiations, they negotiate to a payoff that exceeds men (Kray et al. 2001).

Organizations can also take action to reduce inequality within the organization. While the socialization process that takes place within organizations filters out those who do not fit in, hiring a cohort of individuals can protect against this tendency. Research also shows that more cooperative structures (rather than competitive) benefit women and minorities due to increased intergroup contact and opportunities for networking. Finally, organizations can deliberately put women and minorities in management roles which have been shown to provide more future access to managerial roles (Kurtulus and Tomaskovic-Devey 2012).

At the societal level, changes in law push organizations to make their own internal changes. The wider environment surrounding organizations render certain actions as legitimate and others as illegitimate. Laws such as the Equal Opportunities Act trigger organizational change, yet how this law is interpreted and enacted varies by organization. Studies of the impact of diversity initiatives reveal that those managers who are given more leeway to interpret the initiative fare better than those who are micromanaged from above (Dobbin et al. 2015). Thus, special recruitment and training programs had a positive effect on diversity, while job tests, performance evaluations, and grievance procedures had a negative effect (Dobbin et al. 2015). This work shows that some practices meant to reduce discrimination have in fact enhanced it, and how the law is enacted within organizations determines its functioning.

## Future Challenges

While this chapter has looked at causes and solutions for inequality based on gender, race, and social class, it is prudent to understand how larger societal trends impact inequality. Organizations respond to the larger environment and thus context matters for understanding the actions of organizations. In the United States, there is considerable discussion about the rapid growth of inequality since the early 1980s. America does less than almost any other rich democracy to limit economic inequality (Jencks 2002). It is difficult to unionize and the minimum wage is low. These disparities in income affect educational attainment (more affluent people get more education while those who are poor do not) as well as life expectancy (Americans in the top 5% of the income distribution live about 9 years longer than those in the bottom 10%) (Jencks 2002). From an intersectional perspective, income, race, gender, and social class are all intertwined, making these societal trends deeply troubling for inequality scholars.

The changing nature of work also has major implications for inequality. At the societal level, having large organizations reduces wage inequality because they constrain how high (or low) pay goes within their boundaries (Davis and Cobb 2010). Countries with smaller firms (Colombia) are generally more unequal than countries with larger firms (Sweden) (Davis and Cobb 2010). The decline of large corporations and the growth of small, distributed companies have big implications for pay and benefits. The financialization of the economy has vastly increased wealth for those who work in the finance sector relative to other workers (Davis and Kim 2015). While many decry the exorbitant salary of CEOs, the top five hedge fund managers make as much as all the S&P CEO's combined (Davis and Cobb 2010). The system currently in place benefits those with the most wealth. Societal trends such as the financialization of the economy and the decline of large organizations pose new questions for researchers of inequality and organizations.

## Conclusion

Organizations are one area of social life where we see inequality based on gender, race, and social class perpetuated. While organizations enable human beings to act with greater power and

scope, they are also systems that can magnify individual biases and perpetuate societal inequity. As scholars begin to understand the mechanisms underlying individual and organizational decisions, informed practitioners can experiment with ways to mitigate or reverse the effects of these actions. While organizations may not want to discourage the allocation of resources based on merit, managers will need to be attuned to how inequality can arise and be maintained. Organizations also have the ability to act collectively with other organizations in order to shape the law. Making changes at the system level can impact change at the organizational level. Inequality worldwide shows no sign of abatement, and thus the organizational challenges are urgent ones.

# Influence of Organizational Culture and Commitment on Attitudes Toward Change

Aaron Kweku Amanor
Department of Psychology, University of Ghana, Accra, Ghana

## Synonyms

Attitude; Change; Commitment; Culture; Organization; Supervisor; Telecommunication

## Definition

Attitude toward change refers to an employee's overall positive or negative evaluative judgment of a change initiative.

## Introduction

In the last few years, organizations had come under intense pressure to initiate change in a bid to cope with technological advancement (Ahmad and Cheng 2018). Although some organizations implement change in order to survive, they often face serious problems through change implementation process which results in failure to achieve intended change objectives (Hassan et al. 2020). According to Beer and Nohria (2000), two-thirds of all change initiatives fail. One major cause of the failure of organizational change is related to employee attitudes toward change (Choi 2011). Extant literature further contends that many change efforts had not been successful because change agent often failed to recognize the influential role of organizational employees in determining the outcomes of organizational change (Ahmad and Cheng 2018).

In Ghana, the service sector has seen remarkable growth over the years, contributing 48.6% of gross domestic product. Furthermore, the telecommunication sector accounts for more than 12.1% of this growth (Ghana Statistical Service 2006). The growth in part is attributable to the changes that occurred in the telecommunication sector as a result of the liberalization of that sector in the early part of the 1980s. There are six mobile network operators, namely, MTN with market share of 45.63%, Vodafone with 21.97%, Tigo with 14.28%, Airtel with 12.35%, Glo with 5.17%, and Expresso with 0.59% (National Communication Authority 2014). These companies have adopted varied strategies and change initiatives in order to improve their performance.

Change management literature suggests that there is a rising acknowledgement of the influence of organizational culture and commitment on change implementation success (Vakola and Nikolaou 2005). The organizational culture includes standards and norms that prescribe how employees should behave in the organization (Martins and Martins 2003). According to Goffee and Jones (1998), people have to exhibit the behaviors of sociability or solidarity for the benefit of the organization in order for the organization to succeed. Organizational commitment is considered as a strong belief by an employee, in the missions and objectives of an organization, a wish to continue a relationship with the organization and a readiness to devote substantial effort to improve performance of the organization (Michael et al. 2009). Organizational change is also explained as a deliberately planned change in an organization's formal structure, system, process, or product-market domain intended to improve the attainment of one or more organizational objectives (Lines 2005). The challenge for most researchers is how to determine the influence of culture and commitment on organizational change that is currently occurring across the globe and Ghana in particular.

In light of the new mobile number portability option granted to subscribers in Ghana, which requires that mobile telephone customers keep their telephone number when switching from one mobile network provider to another (Buehler and Haucap 2004), intense competition has risen within the industry, with most organizations implementing various forms of changes in order to survive and remain competitive. In spite of the importance of organizational change, studies

estimate that at least 70% of the change initiatives fail (Choi 2011). These change programs have failed due to the underestimation of the central role that supervisors play in the change process. Additionally, the studies on organizational culture, commitment, and attitude toward change were carried out in developed countries that have characteristic of cultural individualism with well-developed industrial structures as against developing countries that possess cultural collectivism (Hofstede 2011). Hence, findings in the developed countries may not be applicable in developing countries such as Ghana, hence the need to understand how organizational culture and commitment either support or hinder the process of organizational change in the Ghanaian context.

This entry is particularly important as it provides a better understanding of the relationship between organizational culture, organizational commitment, and attitudes toward organizational change, particularly in the Ghanaian telecommunication industry. The major contribution of this entry is the organization's ability to understand its culture and implications on supervisors' attitude toward organizational change. It would help the organizations introduce new shared values and behavioral norms that might facilitate or support organizational change. This entry also provides insights for organizations on how to properly manage change to reduce the risk of failure when implementing change.

## Theoretical and Empirical Review

### Group Dynamic Approach, Organizational Culture, and Attitude Toward Organizational Change

Group dynamics, as propounded by Lewin (1947), refers to the forces working in groups which shape the behavior of individual within the group. It is concerned with the attributes and nature of the group that makes the group behave the way it does when forces are imposed on it and how the forces could be changed so as to produce the desired kind of behavior (Burnes 2004). According to the theory, organizational change is attributed to a group process rather than an individual process. It is hopeless to deliberately focus on changing the behavior of an individual since that individual is not isolate from the group and rather influenced by the group to conform (Lewin 1947). It can thus be inferred from this theory that in an organization, individual employee's behaviors and attitudes toward change are shaped by the behavior of the group in which they find themselves in; hence, it is not unlikely to say that group norms and behaviors influence individual behaviors, which in turn influences their attitudes toward organizational change. In relation to this study, group norms and behaviors here can be liken to the culture of an organization that form the core identity of organizations and help shape the employees' behaviors (Malekifar et al. 2014). This set of values, norms, and beliefs can form the group behavior of the organization, which can shape employees' individual attitudes toward organizational change.

Organizational culture impacts all aspects of organizational life and therefore has a significant effect on employee attitude and behavior. Rashid et al. (2004) carried out a study to examine the influence of organizational culture on attitudes toward organizational change in Malaysia using questionnaires. The study revealed that organizational culture has a significant impact on change process being undertaken in the organization. It was established that the organization must first identify the culture prevailing in the organization and then adopt the right approach to implement the planned change. This requires that managers should identify the best organizational culture that is receptive to change. Evidence suggests that developmental culture plays a significant role in shaping employee behavior and responses to change (Ahmad et al. 2020). Developmental culture focuses on flexibility, adaptability, and readiness and resource acquisition which are very receptive to organizational change (Moynihan and Pandey 2007). In such cultures, employees are motivated and empowered to be a part of the change, participate in the decision-making process, and take an active role in facilitating change (Ahmad et al. 2020).

Haffar et al. (2014) examined the relationship between organizational culture and individual

readiness for change in Syria. Result shows that organizational culture strongly influences individual readiness for change. The study further revealed that a conducive and supportive organizational culture facilitates an improved acceptability of organizational change. In a similar studies conducted by Cameron and Quinn (2006), it was found that employees who see their organizational setting as having attributes and resemblance of a conducive and supportive organizational culture are likely to embrace organizational change and therefore demonstrate positive attitudes toward organizational change. A similar study by Pinto et al. (2011) on organizational culture and cross-cultural adjustment among foreign national reveals that organizational culture had a significant influence on work adjustment. The study reveals that home sociability thrives on closeness and intimacy to create a relationship bond between people, while solidarity develops when individuals conceive the advantage of pursuing a common goal and interest which does not require relationship bond between people nor proximity of people. Based on the works reviewed above, the study hypothesizes that:

H1: Organizational culture will be positively related to supervisors' attitudes toward organizational change.

### Organizational Support Theory, Organizational Commitment, and Attitude Toward Organizational Change

Organizational support theory (OST) was developed around the ideas that organization's concerns are important reasons for employees' commitments to organizations. It explains relationships between employee and their organizations based on social exchange (Rhoades et al. 2001). The theory's central construct is based on perceived organizational support (POS) (Baran et al. 2012) and outlines three outcomes of perceived organizational support (Rhoades and Eisenberger 2002). Firstly, it argues that perceived organizational support produces a felt responsibility by employees to assist the organization achieve its goal. Secondly, perceived organizational support drives the fulfillment of employees need which leads to employees accepting organizational membership. Finally, perceived organizational support reinforces employee perception and belief that increase performance would be rewarded by the organization. In the context of the present study, organizational commitment can be considered very instrumental in influencing employees' attitude toward organizational change. That is, if employees perceive their organization as being supportive of their well-being, the employees' commitment levels may increase and subsequently result in a positive attitude toward organizational change. On the other hand, if workers perceive unfavorable treatment from the organizations, it will have a negative effect on their commitment, which might result in negative attitude toward change.

Studies revealed that organizational commitment plays a significant role in determining employee's acceptance of change (Yousef 2000). Vakola and Nikolaou (2005) explore the connection between employees' attitudes toward organizational change, organizational commitment, and occupational stress among organizations in Greece. The finding confirmed that employees with high organizational commitment were more inclined to accept changes in the organization. Similarly, Parish et al. (2008) in their online survey examined the role of employee commitment in organizational change initiatives in a large not-for-profit organization in the United States of America. The study demonstrated that commitment impacts employee perceptions about change implementation success and also influences attitudes regarding organizational change.

Furthermore, Nafei (2014) investigated the link between organizational commitment and employees' attitude toward organizational change in Saudi Arabia. The study found that organizational commitment is a significant element that influences organizational change. It influences the decision and willingness of employees to accept change. Thus, respondents with high level of organizational commitment were inclined to put in extra efforts toward change project. This finding was similar to studies conducted by Peccei

et al. (2011) in Italy. Based on the works reviewed above, the study hypothesizes that:

H2: Organizational commitment will be positively related to supervisors' attitudes toward organizational change.

## Methods

### Research Setting

I-Zone Limited, a telecommunication distributer for MTN Ghana, was considered for the study. In 2020, the I-Zone Limited decided to change and replace the manual operating process with an integrated software platform for all departments. This change aims to promote productivity and efficiency at work and also allow employees to work remotely due to the COVID-19 pandemic. Other restructuring includes implementing new rules and procedures which made the entire employees perform their job in a different way. The restructuring also altered the company's internal structure, redefining the working relationships, merger of some departments, and changes to work practices. These recent changes in the company make the company very suitable for this entry to measure supervisors' attitude toward change in general.

### Research Design and Sampling Techniques

To meet the objectives of the study, the researcher employed the quantitative approach and the cross-sectional survey design in data collection and analysis, using a standardized questionnaire. A two-stage sampling process was adopted in this study. The first stage involved selecting the organization in the telecommunication sector, while the second stage involved selecting the individual participants to form the sample of the study. This was then followed by a simple random sampling technique to select the individual supervisors from the company for the study.

### Sample Size

Based on the sample size determination by Miller and Brewer (2003), sample size approximated to 180 supervisors was selected for the study. Questionnaires were accordingly administered to the respondents. Out of the 180 questionnaires administered, 170 of the questionnaires were successfully retrieved and used for data analysis. The remaining 10 questionnaires could not be retrieved. Thus, a response rate of 94.44% was obtained.

### Data Collection Instrument

#### Measure of Organizational Culture

Organizational culture scale developed by Goffee and Jones (1998) was adapted to measure organizational culture (behavior of solidarity and sociability). The instrument consists of 23 items. Individual responses to the questions were measured on a five-point interval scale. The responses ranged from 1 (strongly disagree), 2 (slightly disagree), 3 (neither agree nor disagree), 4 (slightly agree), to 5 (strongly agree). The Cronbach's alpha reliability coefficient was 0.72.

#### Measure of Organizational Commitment

The Organizational Commitment Questionnaire (OCQ), which was developed by Mowday et al. (1979), was used in measuring organizational commitment. This instrument consists of 15 structured statements. Individual responses to the questions were measured on a seven-point interval scale. The responses ranged from 1 (strongly disagree), 2 (slightly disagree), 3 (neither agree nor disagree), 4 (slightly agree), to 5 (strongly agree). The Cronbach's alpha coefficient was 0.82.

#### Measure of Attitude Toward Organizational Change

The supervisor's attitudes toward organizational change were measured using the attitudes toward organizational change questionnaire developed by Vakola et al. (2004). The scale consists of 29 items (15 positives and 14 negative items). Responses measured on a 5-point scale range from 1 (strongly disagree), 2 (slightly disagree), 3 (neither agree nor disagree), 4 (slightly agree), to 5 (strongly agree). High scores on the scale represented positive attitudes, while low scores on the scale represented negative attitudes toward

organizational change. The Cronbach's alpha reliability coefficient was 0.89.

### Ethical Consideration

The main purpose of the ethical principle guiding research is for the welfare and protection of individuals and groups. Consequently, ethical principles like confidentiality, freedom to quit, informed consent, and promise of no harm to respondents were considered in the study. Permission was sought from the Human Resource Department of I-Zone Limited, the organization used in this research. Detailed instructions regarding the purpose of the study and voluntary participation in the research were clearly spelt out. In addition, respondents were informed that there was no adverse effect should they participate or decline to participate in the research. To ensure confidentiality and anonymity of responses, respondents were instructed not to write their names on the questionnaires to disclose their identity. Furthermore, all the respondents were given an envelope into which they sealed their completed questionnaire before submitting it. Finally, respondents were also made to understand that the research was strictly for academic purposes and their responses will be handled with utmost confidentiality and privacy.

### Analysis of Data

The study used multiple regression with the control variables in the equations to test the hypotheses. Due to the relatively small sample size ($n = 170$), it was undesirable to use structural equation modeling because of low parameter-to-respondent ratios (Hair et al. 2010).

## Results

### Descriptive Statistics and Correlation

Descriptive statistics, standard deviation, and correlations among the variables are presented in the table below:

From Table 1, it is observed that a positive significant relationship exists between organizational culture and attitude toward organizational change ($r = 0.460$, $p < 0.01$) at 1% level of significance. Also, a positive significant relationship is observed between organizational commitment and attitude toward organizational change ($r = 0.596$, $p < 0.01$) at 1% level of significance. This means that there is linear relationship between organizational culture and attitudes toward change as well as between organizational commitment and attitudes toward change. With regard to multicollinearity, the correlation coefficient ($r = 0.40$) between the independent variable, organizational culture, and organizational commitment is below the threshold of 0.70 which indicates a low multicollinearity between the independent variables.

### Hypotheses Testing

#### Analysis on Influence of Organization Culture on Attitudes Toward Change

Multiple linear regression analysis was used to determine how organizational culture predicts supervisors' attitudes toward organizational change. Gender, age, education, and length of service were used as control variables, in order to assess the exact extent to which organizational culture predicts attitude toward organizational change, devoid of the perceived influence of the demographic variables. The results of this analysis are presented in Table 2:

From Table 2, the $R^2$ of 0.23 indicates that about 23% of the variation in attitudes toward organizational change is accounted for by organizational culture and the demographic variables of respondents. The results show that the regression model is well fit ($F = 9.74$, $p = 0.000 < 0.05$). Notably, organizational culture is observed to have a positive and significant influence on attitude toward organizational change ($\beta = 0.497$, $t = 6.87$, $p = 0.000 < 0.05$). This means that a unit increase in positive organizational culture can lead to an increase in the levels of supervisors' attitudes toward organizational change by 0.497 unit. Thus, hypothesis one which states that organizational culture will be positively related to supervisors' attitudes toward organizational change was confirmed.

**Influence of Organizational Culture and Commitment on Attitudes Toward Change, Table 1** Estimates of means, standard deviations (SD), and correlation of variables

| Variables | Mean | SD | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|---|---|
| Gender | 1.51 | 0.501 | 1 | | | | | | |
| Age | 2.08 | 0.625 | −0.258** | 1 | | | | | |
| Education | 1.95 | 0.740 | −0.405** | 0.278** | 1 | | | | |
| Length of service | 2.20 | 0.927 | −0.031 | 0.362** | 0.119 | 1 | | | |
| Culture | 89.52 | 15.85 | −0.128 | 0.062 | −0.134 | −0.177* | 1 | | |
| Commitment | 78.59 | 12.14 | 0.096 | −0.154* | −0.265** | −0.167* | 0.400** | 1 | |
| Attitudes | 110.57 | 17.76 | 0.013 | −0.028 | −0.013 | −0.082 | 0.460** | 0.596** | 1 |

Note: (**) = 0.01, (*) = 0.05, $n = 170$

**Influence of Organizational Culture and Commitment on Attitudes Toward Change, Table 2** Summary of multiple linear regression analysis

| | Unstandardized coefficients | | Standardized coefficient | | |
|---|---|---|---|---|---|
| Model | *B* | Std. error | *Beta* | *t* | Sig. |
| Constant | 53.11 | 11.68 | | 4.55 | 0.000 |
| Gender | 3.71 | 2.75 | 0.105 | 1.35 | 0.178 |
| Age | −2.01 | 2.22 | −0.071 | −0.904 | 0.367 |
| Education | 2.72 | 1.88 | 0.113 | 1.45 | 0.149 |
| Length of service | 0.401 | 1.44 | 0.021 | 0.278 | 0.782 |
| Culture | 0.557 | 0.081 | 0.497 | 6.87 | 0.000 |

Dependent: attitude toward organizational change, $R^2 = 0.23$, $F = 9.74$

**Influence of Organizational Culture and Commitment on Attitudes Toward Change, Table 3** Summary of multiple linear regression analysis

| Model | Unstandardized coefficients | Standardized coefficient | | | |
|---|---|---|---|---|---|
| | *B* | Std. error | *Beta* | *t* | Sig. |
| 1 constant | 26.43 | 11.17 | | 2.37 | 0.019 |
| Gender | 0.874 | 2.43 | 0.025 | 0.360 | 0.719 |
| Age | 1.01 | 1.97 | 0.035 | 0.509 | 0.611 |
| Education | 3.79 | 1.69 | 0.158 | 2.24 | 0.026 |
| Length of service | −0.112 | 1.29 | −0.006 | −0.088 | 0.930 |
| Commitment | 0.936 | 0.094 | 0.640 | 9.92 | 0.000 |

Dependent: attitude toward organizational change, $R^2 = 0.38$, $F = 20.06$

### Analysis on the Influence of Organization Commitment on Attitudes Toward Change

Similarly, multiple linear regression analysis was used to determine how organizational commitment predicts attitudes toward organizational change. Gender, age, education, and length of service were used as control variables. The results of these analyses are presented in Table 3:

From Table 3, the $R^2$ of 0.38 indicates that about 38% of the variation in attitude toward organizational change is accounted for by organizational commitment and the demographic variables of respondents. The analysis shows that the regression model is well fit ($F = 20.06$, $p = 0.000 < 0.05$). The result of the regression analysis also shows that organizational

commitment predicts attitudes toward organizational change ($\beta = 0.640$, $t = 9.92$, $p = 0.000 < 0.05$). More importantly, the results confirm a positive and significant relationship between organizational commitment and attitudes toward organizational change. This means that a unit increase in organizational commitment can lead to an increase in supervisors' attitudes toward organizational change by 0.640 unit. Thus, hypothesis two which states that organizational commitment will be positively related to supervisors' attitudes toward organizational change was also confirmed.

## Discussion

Over the years, researchers of organizational change have argued that employee reaction to organizational change is one of the main determinants of change success (Rashid et al. 2004). Nevertheless, the roles attitudes play during change have predominantly focused on change agents, managers of organization, and recipients of change, neglecting the role supervisor's attitudes play during periods of change. Recognizing the significant role that supervisors play in response to change efforts, this entry investigates the influence of organizational culture and commitment on supervisors' attitudes toward organizational change in a Ghanaian telecommunication firm.

The results from the analysis of the influence of organizational culture on attitudes toward organizational change confirmed that organizational culture influenced supervisor's attitudes toward organizational change positively and significantly. The study demonstrates that organizational culture high in solidarity and sociability with aspects that ensure that people work hard, make things happen, and hit set targets significantly influences organizational change. Organizational culture is also assumed to have a positive main effect on supervisors' attitude toward change. In line with findings obtained from previous studies (Ahmad et al. 2020), the data from this study provide good support for organizational culture as a valid framework to predict supervisor's attitudes to support change, in that organizational culture was significantly related to attitude toward change. Such a finding implies that supervisors with positive organizational culture high in solidarity and sociability are expected to demonstrate positive attitudes to support organizational change efforts. Thus, the nature of organizational culture should motivate and empower supervisors to be a part of the change, participate in the decision-making process, and take an active role in facilitating change (Ahmad et al. 2020). The study results further highlight the supportive role organizational culture plays during organizational change. This finding is consistent with the study of Rashid et al. (2004) which revealed that organizational culture is related with attitudes toward organizational change and also in agreement with the study by Haffar et al. (2014), Pinto et al. (2011), and Cameron and Quinn (2006), which argues that employees who see their organizational setting as having attributes and resemblance of a conducive and supportive organizational culture are likely to embrace organizational change and therefore demonstrate positive attitudes toward organizational change.

In addition, the current findings about organizational culture influencing supervisors' attitudes toward change are also theoretically explained by the group dynamic theory which advances that the norms (culture) of a group influence the attitudes and behaviors of individual, since that individual is not isolated from the group and therefore influenced by the group to conform (Bargal et al. 1992). Group norms as revealed by the group dynamic theory can be likened to the culture of the organization. As indicated earlier, culture constitutes a set of values, beliefs, and behavior patterns that symbolizes the main identity of the organization and helps shape individual's behaviors (Malekifar et al. 2014). This set of values, norms, and beliefs constitutes the culture of the organization, which shapes the supervisors' attitudes within the organization to conform. This could account for the significant influence of organizational culture on respondent attitudes toward change.

The finding on the analysis of the influence of organizational commitment on attitudes toward

organizational change shows a positive influence of commitment on attitudes toward change. This shows that supervisors with strong belief in the objectives of the organization demonstrate positive attitudes toward change. The findings agree with the study by Vakola and Nikolaou (2005) and Peccei et al. (2011) which showed that employees with high organizational commitment were more inclined to accept changes in the organization. Thus, employees who are highly committed and believe that the organizational change would be beneficial to them would be willing to accept the change. Similarly, Parish et al. (2008) demonstrated that organizational commitment influences employee perceptions about change implementation success and that employee attitudes regarding organizational change are influenced by commitment. In addition to the above, the finding of Nafei (2014) similarly found that organizational commitment is a significant element that influences organizational change, influencing the decision and willingness of employees to accept change. The study showed that respondents with high level of organizational commitment were inclined to put in extra efforts toward change project, and consequently they were prone to develop positive attitudes toward organizational change.

Even though research with respect to the predictive capability of organizational commitment on supervisors' attitude toward organizational change appears to have a basis in literature, the finding of the present entry is also in agreement with the notion by Rhoades and Eisenberger (2002), advanced in their organizational support theory. They assume that in order to assess the benefits of increased work effort, employees form a global belief concerning the extent to which the organization cares about their well-being (Rhoades and Eisenberger 2002). This perceived organizational support increases employees' felt responsibility to support the organization achieve its set goals and arouse employees' commitment toward the organization. Thus, when supervisors perceive their organization as being supportive of their well-being, it arouses their commitment toward the organization and subsequently results in a felt responsibility to demonstrate positive attitudes to support organizational change.

This current finding is thus justified on the interrelationships that have been found both in this study and in related literature among organizational culture, organizational commitment, and attitude toward organizational change. The culture that exists in the organization is supportive socially and economically, to a large extent, and as indicated in literature, it is enough to engender commitment from supervisors and subsequently influence their positive attitudes toward change in the organization.

## Practical Implication

This entry has practical implications, particularly for managers and agents responsible for designing and implementing organizational change efforts. Although changes can be easily forced on recipients through supervisors by management of an organization (Ahmad et al. 2020), the change will be much more effective if supervisors can convince the affected employees to embrace and support the new change. Consequently, it is important to understand the factors that facilitate or inhibit supervisors' attitude toward change. As organizational culture and commitment were all found to be strong predictors of supervisors' attitude toward change, it is important for change managers to provide conducive organization culture to make their supervisors ready for change and also create a working environment that promotes commitment among the supervisors.

Also, the organization should institute measures to keep supervisor's positive attitudes toward change. Furthermore, it is recommended that the organization should not only encourage positive organizational culture, but importantly the organization should facilitate formal and informal relationship among supervisors aim at enhancing their commitment.

## Limitations and Conclusion

This entry has some limitations. First, data for the study was gathered from one single organization. Conducting a research with one organization

might lead to findings that are dependent on specific organizational characteristics. Second, the design of the study was cross-sectional which collected information at one point in time. This design restricts the researcher's ability to deal with the development of organizational change and its effect on supervisors' attitudes over a period of time. Also, the generalizability of the research report could have been enhanced by involving more organizations, but time and logistic constraints did not allow for that.

Based on the findings, the entry concluded that when sociability and solidarity dimensions of culture are healthy, the culture makes the organization tremendously effective, and supervisors who work for the organization feel immensely fulfilled with a high level of commitment and therefore develop positive attitudes toward organizational change.

[2]Instituto de Economía, Facultad de Ciencias Económicas y de Administración, Universidad de la República, Montevideo, Uruguay

## Synonyms

Central nodes; Core organizations; Inter-organizational cooperation; Inter-organizational alliances; Strategic actors

## Definition

A collaborative policy network is a group or system of interconnected organizations that interact and collaborate to jointly deliver a good or service that cannot be delivered by a single public agency or private organization.

## Introduction

Social policy networks consisting of diverse and independent organizations are a popular instrument to implement policy at community level. However, little is known about the way in which different types of organizations collaborate in these networks and if these interactions depend on the nature of their funding (public/private) and/or their remit of activity. These characteristics have implications on the type of resources organizations might depend on and, therefore, on their participation in networks. The type of the links established in these interorganizational arrangements varies in terms of the resources that organizations depend on to address power imbalances.

This entry focuses on how intrinsic characteristics of organizations might determine their position and role played in collaborative networks. In addition, it aims to analyze if these characteristics change when considering different types of interorganizational interactions.

## Theoretical Background

Collaborative networks have become a popular strategy for social policy implementation. In these networks, actors interact to jointly deliver a good or service that cannot be offered by a single organization (Isett and Provan 2005). Although collaborative networks pursue a common goal, not all organizations get involved in the same way. Organizations interact in networks aiming to promote their goals and based on their own attributes (Agranoff 2007). Thus, neither all organizations contribute equally to the formation of such networks nor they participate equally from their links. For example, while some actors may fulfill specialized roles by focusing on their scope of activity, others can play network managing roles, which can range from mere facilitation to orchestration of relationships (Rethemeyer 2005). Analyzing how organizations get involved in collaborative networks is crucial to understand coordination processes among them.

In order to identify and examine different ways of getting involved in collaborative networks, this entry grounds on both social network analysis (SNA) and resource dependency theory (RDT). Research on SNA associates the position occupied by actors with the role they play in social networks. In particular, two network properties have been profusely analyzed in the literature: centrality and embeddedness.

Being a central node in the network, with a large number of links and good connections to the rest of the actors, is associated with being influential and prestigious, with ease to spread ideas, good access to resources, and capacity to intermediate and "orchestrate" actions carried out by other actors (Wasserman and Faust 1994). On the other hand, being embedded in a densely connected cluster implies belonging to a group of actors with common rules, mutual control, and trust, which maintain periodic interactions and reciprocal information flows among them (Uzzi and Spiro 2005).

Theoretically, RDT has underpinned most of the academic literature exploring the interaction decisions of organizations as a response to their need for external resources (Drees and Heugens 2013). It has been argued that organizations use alliances strategically to reduce their exposure to uncertainty, risk, and opportunism (Starkey et al. 2000) and that collaboration is directly related to increased resources and legitimacy of organizations (Drees and Heugens 2013). Popular organizations have characteristics that make them more desirable partners than others, with higher networking opportunities and more central positions in the networks (Berardo and Scholz 2010). In turn, network embeddedness can boost performance (Schalk et al. 2010), which is why research in this area has frequently focused on exploring the effectiveness of policy implementation networks (Lecy et al. 2014).

Based on SNA and RDT, hypotheses are generated to test if organizational characteristics such as resource dependency and remit of activity are associated with position, importance, and influence in collaborative networks.

### Economic Resource Dependency

Social policy networks require the participation of both public agencies and nonstate actors. To increase policy effectiveness at a local level, public agencies have frequently funded well-connected private organizations in the community as lead organizations to mobilize the network (Graddy and Chen 2006). This resource interdependency will affect the decision to collaborate of the lead organizations in the networks and increase their motivation (Foster and Meinhard 2002). Similarly, private independent organizations can frequently rely almost completely on public funding contracts adapting their strategic decision-making and organizational goals (Ibid.). These organizations will have higher incentives than privately funded organizations to interact in order to access additional funds or legitimacy. Funding is critical to the exercise of power and influence within a policy network (Hatmaker and Rethemeyer 2008). Thus, it is hypothesized that sources of funding of organizations can determine their network positions:

$H_1$: Lead organizations of social policy networks at community level will have more central and influential positions in a network.

$H_2$: Organizations that operate with a majority of private funding are less likely to occupy central positions in social policy networks.

### Remit of Activity

Network research in public administration focusing on individual properties of the nodes has generally explored interactions among organizations operating in particular areas of expertise. Yet, social policy networks involve more heterogeneous actors pursuing different aims. The diversity and unpredictability of stakeholder demands can determine the extent of networking (Andrews et al. 2011). Organizations with broader, multidimensional, objectives face more capacity constraints due to the complexity and variety of the social services they need to offer. Cooperating allows these organizations to supply a wider range of products and services (Dyer and Singh 1998) and enables them to successfully fulfill their

broader mandates. Organizations with more ambiguous aims, such as those in social services, might have a higher propensity to collaborate than those with narrower mandates, such as healthcare providers. Therefore:

$H_3$: Organizations with multidimensional aims are more likely to have more central and influential network positions than organizations with narrower mandates.

### Subnetworks

Organizations' mutual dependencies also influence the type of links that organizations engage in Berardo and Scholz (2010). Organizations can develop links at different levels of intensity, which range from superficial to intense, depending on their needs (Konrad 1996). To portray the importance of the different types of links on the attributes and better understand the complexity of social policy networks, data on three subnetworks underlying the global network (information diffusion, infrastructure sharing, and collaborative projects) are examined. Sharing information is the least intense networking level, where most relationships are informal (Hatmaker and Rethemeyer 2008). However, the importance of information exchange in the effectiveness of collaborative networks has been highlighted in the literature, for example, when responding to catastrophic disasters (Kapucu and Wart 2006), and is relevant as the main type of link promoted by the social program focus of this study. The next type of link is sharing infrastructures because, even if it is a form of collaborative action, organizations usually pursue different goals. Finally, the highest level of collaboration is established in collaborative projects where the organizations remain autonomous but pursue similar goals, and relationships are formal and structured. Evidence suggests that "consequential" networks that involve resource exchange and joint decision-making among the partners are more effective (Graddy and Chen 2006). It can be argued that the determinants of the network position and organizational influence are likely to vary depending on the type of links. For example, the relative importance of social policy promotion organizations in a network is likely to be high for information sharing for their need to refer clients to other more focused organizations (Provan 1984) but less so for sharing infrastructures or collaborative projects. Therefore:

$H_4$: The determinants of network position and influence of an organization in a network are likely to vary depending on the type of the link considered

## Data and Methodology

In this entry, a social network dataset collected as part of a larger study to evaluate a national public program in Uruguay is used. This program, named SOCAT (Spanish acronym for Guidance, Advice, and Local Coordination Service), aims to consolidate the local capacity of stakeholders to strengthen social integration by developing local networks of multiple public and private organizations. Such organizations provide services in the areas of education, healthcare, social care, culture, sports, social policy promotion, and gender equality and gender-based violence.

The data were obtained in face-to-face semi-structured interviews conducted with managing directors of organizations in charge of public policy implementation in 18 deprived neighborhoods throughout the country. Three types of undirected links are measured: information diffusion, sharing infrastructures, and project collaboration. These interactions allow constructing 3 subnetworks for each of the 18 geographical areas represented. One overall-cooperation network was constructed for each neighborhood, aggregating the three types of links. Figure 1 shows the social policy networks in 2 of the 18 neighborhoods analyzed (San Miguel, Artigas, and Villa Garcia, Montevideo).

To measure the participation of each organization in the networks, the article employs node-level indicators analyzing their relative position, with a focus on centrality and embeddedness. The centrality measure used is degree centrality,

**Influential Players in Social Policy Networks, Fig. 1** Two examples of social policy networks in Uruguay

defined as the number of links connecting the node. Organizational embeddedness is measured using the clustering coefficient, i.e., the probability that the neighbors of a node are connected among them. Finally, coreness, a third network indicator is calculated. This index accounts simultaneously for both centrality and embeddedness of nodes as it measures the level of interconnection inside the clusters or subgroups to which an organization belongs.

To understand organizational intrinsic characteristics that determine their relative importance, network outcomes (degree, clustering, and coreness) were modeled as a function of different attributes of social policy organizations that can potentially determine their network position. Different independent variables were considered, indicating the remit of the organization and whether its funding is public or private.

## Results

Table 1 shows the organizational determinants of the relative importance in the overall network. Results suggest that organizational characteristics determine two types of involvement in this global network. The first type of network positioning includes the strategic players and is determined by organizations with high centrality and coreness but low clustering. These are found to be organizations operating in the name of the Ministry (SOCAT), as expected in H1, and others working on education, health, social care, and social policy. These are key organizations in the network, which are very well connected, and act as intermediaries in the relations among other actors. Except for social care, their contacts are not restricted to a specific cluster of organizations. This is what was expected (H3), except for the health sector. The second type of involvement in the network can be described as more marginal, for example, as was hypothesized in H2 private organizations seem to play less relevant roles, presenting inconclusive results for centrality and coreness as well as negative clustering. Even though these results appear to suggest that organizations labeled as private do not play a strategic role in this social policy network, the more detailed findings shown in Table 2 indicate that their importance depends on the type of link.

**Influential Players in Social Policy Networks, Table 1** OLS estimation of the organizational determinants of network position

| Dependent variable: VARIABLES[a] | Degree (1)[b] | Clustering (2) | Coreness (3) |
|---|---|---|---|
| Private | 0.009 (0.023) | −0.134*** (0.044) | 0.160 (0.456) |
| SOCAT | 0.549*** (0.084) | −0.318*** (0.049) | 3.675*** (0.637) |
| Education | 0.058*** (0.021) | −0.157*** (0.047) | 1.468*** (0.425) |
| Health | 0.051* (0.028) | −0.106* (0.055) | 0.856* (0.465) |
| Social care | 0.096*** (0.033) | −0.077 (0.063) | 1.773*** (0.523) |
| Culture/sports | −0.023 (0.033) | −0.020 (0.083) | −0.101 (0.665) |
| Gender/violence | −0.030 (0.032) | −0.051 (0.093) | −0.320 (0.685) |
| Social policy[c] | 0.078*** (0.025) | −0.095** (0.048) | 1.563*** (0.434) |
| Constant | 0.155*** (0.017) | 0.418*** (0.063) | 4.156*** (0.541) |
| Territorial indicators | No | Yes | Yes |
| Observations | 669 | 669 | 669 |
| $R^2$ | 0.239 | 0.110 | 0.168 |
| Number of territories[d] | – | 18 | 18 |

[a]Robust standard errors are in parentheses. $***p < 0.01$, $**p < 0.05$, $*p < 0.1$
[b]Degree has been normalized to account for network size. Regressions for (2) clustering coefficient, and (3) coreness include 18 territory indicators that have not been reported in the table
[c]"Others" is the base category for sector of the organization
[d]San Miguel (Artigas) is the baseline territory

The results presented in Table 2 indicate the organizational determinants of network position by type of the interaction. As hypothesized in H4, results indicate that the determinants of network position vary by type of link. While there is a positive and significant association between being a private organization and having a more central position both in sharing infrastructures and project collaboration networks, private organizations are significantly and negatively linked with centrality in information networks. This might be because private organizations are fewer in number, operate independently, and are therefore more likely to be isolated from public policy networks. It may also indicate less involvement of nonstate actors in information networks that are mobilized by publicly funded lead organizations.

Three types of organizations are positively and significantly associated with more central and core positions in all three types of networks. Those are lead organizations (SOCAT), actors providing social care services, and those devoted to social policy promotion. These results confirm the high relevance of organizations devoted to these activities in all collaborative interactions.

Education organizations have higher centrality and coreness in infrastructure sharing and project collaboration networks. With the exception of coreness (marginally significant), the results for centrality and clustering in information sharing networks are not significant. The results for those organizations providing health services are similar, revealing that education and health organizations are important in the former two interactions while playing marginal roles in the diffusion of information. These results support other findings in organizational literature where organizations with narrower mandates generally perform worse as networkers; however, this study adds to these results that worse network performance depends on the type of link being evaluated. Findings suggest that organizations with more specialized missions perform better in more formal subnetworks with more intense links.

## Conclusion

Organizational characteristics determine the relative importance of organizations in social policy networks; thus, these aspects should be considered when the networks are being mobilized. Furthermore, distinguishing subnetworks with different types of ties is crucial when trying to understand

[a]Robust standard errors are in parentheses. $***p < 0.01$, $**p < 0.05$, $*p < 0.1$

the role of the different organizations in a particular network because it reveals which organizations are driving the implementation of the policy.

These findings could guide public administrators so that they involve a particular type of actor when developing and promoting networks. Exploring subnetworks is equally useful for managers of social policy organizations as this can help guide their decision-making in terms of network participation and which types of ties they might want to concentrate on in order to reach their objectives. Results can also assist policy makers in determining the types of ties that are more aligned with the implementation of a particular policy.

# Informal Administrative Processes

Andrew Osorio
School of Public Affairs and Administration, University of Kansas, Lawrence, KS, USA

## Synonyms

Informal adjudication; Informal agency action; Informal rulemaking; Notice and comment rulemaking

## Definition

The term "informal administrative processes" is a catch-all that encompasses two categories of activity which constitute the vast majority of tasks undertaken by federal agencies in the United States. The first category – informal or "notice and comment" rulemaking – refers to agency actions governed by § 553 of the Administrative Procedure Act (APA). The second category – often referred to as "informal adjudication" or simply informal agency action – covers a wide variety of agency activity that is not regulated by the APA.

## Introduction

Administrative officers and agencies have been a part of American government since the late eighteenth century when the First Congress of the United States empowered officials to implement policies such as the imposition of duties on imported goods or the adjudication of military pensions for soldiers injured during the Revolutionary War. It was, however, the myriad domestic programs of the New Deal, combined with the exigencies of the Second World War, that resulted in the numerous, expansive, and powerful federal agencies that characterize the modern administrative state. And although this massive delegation of policymaking authority from Congress to executive agencies allowed the federal government to keep pace with the governance demands of an ascendant postwar nation, the rapid rise of discretionary power among nonelected officials engendered serious concerns about the constitutional legitimacy and political accountability of this emergent fourth branch of government (see, e.g., Rosenbloom 2015).

In order to assuage some of the fears associated with this new administrative apparatus, Congress unanimously passed the Administrative Procedure Act (APA) which was signed into law in 1946. Essentially, the APA embodies the core principles and processes governing discretionary agency actions and serves as the foundation of the modern administrative state (Rosenbloom and O'Leary 1997). In this sense, the statute has drawn comparisons to the US Constitution or the Magna Carta (see Barry and Whitcomb 2005; Beermann 2011). However, unlike other organic laws, the APA is not superior to, nor does it displace, specific procedural or substantive requirements mandated by the legislature, the executive, or the courts. In short, the APA is not an exhaustive or exclusive code of procedure but rather serves as a generalized and residual legal framework for administrative action (Shapiro 1988).

In outlining agency practices, the APA divides, either explicitly or by implication, all administrative activity along two separate dimensions: the first dimension categorizes actions as either rulemaking or adjudication, while the second dimension distinguishes actions as formal or informal. Because very nearly all rulemaking and adjudicatory acts are informal in nature, this brief entry will offer an introductory overview of informal administrative processes.

## Defining Informal Agency Actions

Unfortunately, there is no single definition that fully and precisely describes all of the substantive activities that fall under the penumbra of "informal agency action." The task of explicating a unitary definition for informal action is made difficult by the fact that (1) the term takes on different meanings depending upon the context of the agency activity in question and, (2) despite the binary framework imposed by the APA, it is more accurate to conceptualize informality as a spectrum rather than a sharp dichotomy (see, e.g., Beermann 2011; Warren 2011).

For instance, informal rulemaking (discussed in greater detail below) refers specifically to agency rules promulgated in accordance with the procedures outlined in APA § 553. Thus, the term informal does not necessarily imply the absence of procedural requirements – rulemaking under APA § 553 (referred to "notice and comment" or "informal" rulemaking) is informal in comparison to the far more elaborate and onerous procedures mandated by APA §§ 556 and 557 which control the process of formal

rulemaking and greatly circumscribe administrative discretion. Moving down the continuum, informal rulemaking is, in turn, rather more structured than the other so-called informal agency action (at times referred to as "informal adjudication") such as discretionary law enforcement, the provision of legal guidance to individuals (e.g., private letter rulings issued by the Internal Revenue Service), the threat of possible investigatory action or sanctions in order to induce voluntary compliance, and the grant or denial of applications, permits, and licenses. These administrative activities are not governed by any set of procedural guidelines contained in the APA – nevertheless, as explained below, the lack of applicable APA procedures does not mean that administrative discretion is wholly unconstrained in these situations.

So, while the variety of substantive actions and the differing gradations of formal constraint preclude a detailed and unified definition of informal agency action, the following generic attempts are nevertheless worth noting as they provide a serviceable shorthand:

- Warren (2011) defines informal agency action as any action that does not make use of a "trial-like hearing."
- Beermann (2011) rejects the definitional dichotomy imposed by the APA and states that informal agency action occurs whenever a policy decision is made without the use of rulemaking procedures or a formal adjudicatory process.
- Gardner (1976) offers a pair of definitions: an agency action is informal when it occurs without an evidentiary hearing and formal record; or, more specifically, any action not covered by APA §§ 554, 556, or 557 can be considered informal.

## The Basic Elements and Process of Informal ("Notice and Comment") Rulemaking

Rulemaking, in all its various forms, is the most important task undertaken by agencies (see, e.g., Kerwin 1994). Since the 1930s, the volume of federal law produced by agencies in the form of rules has far outpaced the number of statutes legislated by Congress. Nevertheless, the concept of a rule suffers from some of the same definitional uncertainty as informal action (see, e.g., Rosenbloom 2015; West 1985). That being said, APA § 551 offers perhaps the best explanation of a rule as "the whole or part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency." Because § 551 provides an all-purpose definition, it is necessary to delineate an important distinction implicit in the text. A legislative rule (sometimes referred to as a "substantive rule") is the only type of rule that can exert legally binding effects. In other words, legislative rules have the same practical effect as statutory laws enacted by Congress and the president and are able to create or change existing law and policy or establish new legal rights and duties. Conversely, nonlegislative rules (i.e., interpretive rules, general statements of governmental policy, or rules governing agency organization, procedure, or practice) do not carry the weight of law. In addition to the substantive distinction between legislative and nonlegislative rules, there is an important procedural difference as the creation of legislative rules is controlled by the rulemaking processes of the APA, whereas nonlegislative rules are not similarly constrained. Despite the sheer mass, scope, and substantive importance of legislative rules, a single section of the APA, § 553, establishes the limited procedures that constitute the informal rulemaking process that applies to the overwhelming majority of legislative rules promulgated by federal agencies.

Section 553 of the APA establishes a basic three-step process for informal rulemaking. The first step is the publication of a Notice of Proposed Rulemaking (NPRM) in the *Federal Register* – the *Federal Register* is the official, daily journal of the federal government and contains the text of proposed and final rules, revisions to existing rules, administrative orders, notice of administrative meetings and adjudicatory proceedings, as well as executive orders from the president. In

accordance with APA § 553, the NPRM must provide the following information:

- "A statement of the time, place, and nature of public rule making proceedings;"
- "Reference to the legal authority under which the rule is proposed; and"
- "Either the terms or substance of the proposed rule or a description of the subjects and issues involved."

After publication of the NPRM, the second step for informal rulemaking imposed by APA § 553 is the opportunity for public participation "through the submission of written data, views, or arguments." And while agencies are not required to provide for the "oral presentation" of information or opinion by "interested persons," hearings are permissible at the discretion of the agency. "After consideration of the relevant matter presented," the third and final step required by APA § 553 is publication in the *Federal Register* of the final rule along with "a concise general statement" of its "basis and purpose." Rules adopted through the process of informal rulemaking become effective 30 days after publication in the *Federal Register*, but APA § 553 requires that agencies shall provide "an interested person the right to petition for the issuance, amendment, or repeal of a rule."

## Additional Procedural and Substantive Requirements of the Informal Rulemaking Process

In addition to the procedures outlined above, Congress, the president, and federal courts have regularly imposed supplementary requirements for informal rulemaking. Leading the way in this regard, courts have done the most to embellish upon every stage of the spare procedures outlined in APA § 553. For example, with respect to the NPRM, courts have held that the final rule must be a "logical outgrowth" of the initial proposal inasmuch as the final rule may not materially alter or substantially depart from the contents of the NPRM. Moreover, while APA § 553 does not specify a minimum period of time for which agencies are required to accept written submissions during the second step of the informal rulemaking process, in reviewing agency rulemaking efforts federal courts have focused on whether the agency has provided a "meaningful" opportunity for public participation. In addition to extending sufficient time to submit comments, courts have also required that in order for participation to be meaningful, agencies must allow interested persons the opportunity to respond to opposing comments submitted by other parties. With respect to the "concise general statement" required in step three, courts have mandated increasing levels of explanatory detail and evidentiary justification that have led these statements to balloon from several pages to hundreds or thousands of pages in the case of significant rules (see, e.g., Pierce 2008). Congress has also provided for supplementary procedures through the enabling statutes that authorize agencies to issue legislative rules. For instance, several agencies, such as the Consumer Product Safety Commission, must allow for the presentation of oral evidence and the opportunity for cross-examination when a dispute arises with regard to an "issue of material fact." Lastly, the president, through the use of executive orders, has the ability to impose further demands on the exercise of informal rulemaking. As an example, in 1993, President Clinton issued Executive Order 12,866 which outlined 12 principles of regulation including the need for agencies to assess the cost-effectiveness and cost-benefit of regulations, identify alternatives to the proposed regulation, and seek input from state, local, and tribal governments.

## Exceptions to the Requirements of the Informal Rulemaking Process

In addition to the nonlegislative rules mentioned above, there are several instances where the informal rulemaking process does not apply to rules that would otherwise be subject to the procedures of APA § 553:

- When the rule implicates issues involving the "military or foreign affairs function of the United States"

- When the rule pertains to a "matter relating to agency management or personnel or to public property, loans, grants, benefits, or contracts"
- When the agency has "good cause" to believe that "notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest"

The "good cause" exception provides a significant loophole through which agencies are able to escape the process mandated by APA § 553. A 2012 report by the US Government Accountability Office found that between 2003 and 2010, over 60% of final rules published without an NPRM made use of the good cause exception (U.S. Government Accountability Office 2012).

## Other Informal Agency Actions ("Informal Adjudications")

As noted above, a wide array of agency actions are not covered by the formal procedures mandated by APA §§ 554, 556, 557, or the requirements for informal rulemaking under APA § 553. Collectively, these are referred to as informal agency actions or informal adjudications. For example, the creation of general policy statements, advisory opinions, interpretative rules, and internal agency rules (i.e., nonlegislative rules) are exempted from APA § 553 and are thus informal agency actions. Moreover, despite their legally binding character, legislative rules that qualify for the good cause exception contained in § 553 may likewise be viewed as informal agency action. Informal agency actions that are most readily understood as informal adjudications tend to involve the grant or denial of applications, permits, and licenses. For example, if the Department of State rejects a passport application, or if the Federal Bureau of Investigation denies a prospective purchaser of firearms based on the results from the National Instant Criminal Background Check System, an informal adjudication has taken place. The only requirement imposed upon agencies by the APA when making such informal decisions is contained in § 555 which requires "prompt notice" of the outcome of the proceeding. Other informal agency actions typically involve some form of persuasion or guidance to private parties such as letter rulings from the Internal Revenue Service to individual taxpayers, advice to farmers on the insurability of crops provided by the Federal Crop Insurance Corporation, or the threat of possible civil or criminal investigation in order to persuade a company to voluntarily comply with an agency.

Despite the fact that the APA lacks specific procedural requirements for informal actions, there are in fact constraints on agency discretion in such cases:

- First, judicial enforcement of the Due Process Clause of the Fifth Amendment provides at least some protection against procedural and substantive indiscretion on the part of federal agencies.
- Second, Congress may require agencies to observe certain procedural requirements as part of the statutory delegation of authority.
- Third, agency must adhere to its own internal rules and procedures which may be enforced against them by the courts.
- Fourth, the president is able to establish procedures for informal actions through the use of Executive Orders.

## Standard of Review for Informal Agency Actions

As a final check on administrative discretion through informal rulemaking and adjudications, federal courts are empowered by APA § 706 to review informal agency actions. According to § 706, courts are able to "hold unlawful and set aside" any informal act that is determined to be "arbitrary, capricious, an abuse of discretion or otherwise contrary to law." In theory, the "arbitrary and capricious" standard is the most deferential judicial standard applicable to agencies – in practice, courts largely ignore the "abuse of discretion" aspect of the standard and simply focus on whether the action was either arbitrary or capricious or a clear violation of federal constitutional or statutory law. This standard requires a court to ensure that an agency action is based on a consideration of all relevant factors

and has taken into account alternatives, that there is a rational connection between the facts and the decision, and that the conclusion is sensible and logical (see Beermann 2011). In essence, the court is expected to conduct a thorough review but is prohibited from substituting its own judgment for that of the agency if all requirements have been met.

## Conclusion

It has been argued that the lifeblood of the administrative process is informal agency action (see Warren 2011). In theory, informal processes allow federal agencies to act with flexibility and efficiency while still adhering to the core legislative concepts of information, participation, and accountability (see Kerwin 1994). However, the continual balancing of tensions between bureaucracy and democracy inherent in informal agency action has not been a resounding success. For instance, the imposition of additional procedural and substantive requirements by Congress, courts, and the president has significantly diluted the speed and simplicity of the informal administrative process – its raison d'etre – without necessarily having improved public participation, political accountability, the quality of agency decision-making, or the rules which are ultimately adopted. Conversely, the lack of meaningful procedural guidelines for the overwhelming majority of informal adjudications, along with the substantial escape route provided by the good cause exception for informal rulemaking, means that a great many informal processes are largely unbounded. In short, despite the critical importance of informal actions and processes for the governance capacity of the modern administrative state, a true balance between administrative discretion and democratic legitimacy remains elusive.

# Informal Citizenship

Eris Schoburgh
Department of Government, Faculty of Social Sciences, University of the West Indies, Kingston, 7, Mona, Jamaica

## Synonyms

Citizen-self; Social membership; Social relations of the informal economy; Social substructure

## Definition

Informal citizenship is a status acquired through an individual's membership in a social substructure/subgroup with which he/she identifies as the legitimate collective/context in which to pursue those claims normally associated with and attached to formal citizenship status. Informal citizenship resides in that realm of formal citizenship status where particularistic needs (be they political and civil, economic, or sociocultural) are either unmet or under-met and where a subordinated social system assumes responsibility for meeting them. Whereas formal citizenship status subordinates individualism to universalism and subculturalism to nationalism within the state, informal citizenship is the obverse. It is where there is alienation from the broader collectivity and where social cohesion in the society, economic citizenship, and loyalty to the political system are replaced by spontaneous emergence of particularism and individual self-determination. Informal citizenship is a function of the quality of public governance.

## Introduction

The origin of the concept of *informal citizenship* may be traced to an article written by Eris Schoburgh entitled *Informal Economy and Informal Citizenship: Exploring causation and connectivity in socio-cultural shifts in Jamaica* that was published online by the Centre for Caribbean Studies at the University of Warwick in March, 2007, where Schoburgh was conducting research as an academic fellow. The article was later published by the Caribbean Development Review (volume 1: December 2007) a refereed journal by the United Nations Economic Commission for Latin America and the Caribbean (ECLAC). The concept of informal citizenship is employed as an analytic tool to describe the observed shift in how the Jamaican populace was responding to institutions of the state over the last two decades. This transformation in citizens' attitude and behavior coincides with the expansion of the informal economy which has its genesis in the adjustments occurring in economic relations within the state. The informal economy has had significant impact on sociopolitical relations. The social and political developments are linked to an emergent *informal citizenship* which is a social formation of the informal economy.

## The Informal Economy: Causes and Constitutive Elements

The informal economy is an outgrowth of three socioeconomic forces. First is the structure of economies of postcolonial states during the 1950s and 1960s in which rural depopulation and the resultant urban growth gave rise to a spate of small-scale activities for those who were unable to find employment in the modern sector. These rural migrants were described as "unemployed" or "service workers" or used as a euphemism for poverty: none of which was useful constructs since during this period in many postcolonial states it was not one in which there was full or secured employment from which an individual would necessarily become unemployed (see, e.g., Jefferson 1972). The growth of heterogeneous petty traders and casual labor confounded the projections of modernization theory and spawned a debate among development scholars around whether the sector was a catchment area for low-level productive activity and earnings or a source of innovation and creative production that provided a fairly decent standard of living for the participants/agents. Keith Hart's (1970) concept of the *informal sector* was used by the International Labour Organisation in its 1972 report on Kenya, to describe employment structures in developing countries, and evident in Kenya and in which it acknowledged the expansion of the traditional sector to "include profitable and efficient enterprises as well as marginal activities" (cited in ILO 2002: 10). The informal sector was defined at this stage in terms of employment relations and was distinguishable by seven criteria: ease of entry, unregulated and competitive markets, reliance on indigenous resources, family ownership of enterprises, small scale of operation, labor intensive and adapted

technology, and skills acquired outside of the formal school system (Charmes 1990: 13).

Second are structural adjustment policies which led to expansion of the informal sector in countries where these policies were implemented. Contracting economies evident in closure or downsizing of private firms or public enterprises resulted in retrenched workers who had little alternative but to turn to the informal sector for economic survival. The deficit in public services provision caused by economic restructuring was in some instances filled by the informal sector. Third is a broader process of informalization of economies driven by a decentralist shift in patterns of capitalist development which took shape in developed countries of North America and Europe at the start of the 1980s. It affected production in that standard jobs were made non-standard with few benefits or none at all (ILO 2002:10). Riding on the wave of globalization, decentralization became a standard policy strategy in developing countries with emphasis on competitiveness of markets and products. Producers that were unable to seize new market opportunities either exited the market or increased the numbers that went into the informal economy (Turner and Hulme 1997). The idea of the informal sector evolved from its employment relations conception to *production units or enterprises* to reflect the dynamics of the socioeconomic relations within developing economies. In 1993 the International Conference on Labour Statisticians (ICLS) defined the informal sector as:

> . . .all unregistered or unincorporated enterprises below a certain size, including, micro-enterprises owned by informal employers who hire one or more employees on a continuing basis; and own account operations owned by individuals who may employ contributing family workers and employees on an occasional basis. (ILO 2002: 11)

The *informal economy* has replaced the *informal sector* in development discourses in order to account for the whole range of informality – both enterprise and employment relations – manifesting in industrialized, transitioning, and developing economies. The informal economy refers to production that occurs outside of visible, formal organizations, subjected to the laws and policies of the state (Harrod 1987: 122; ILO 2002; Portes and Haller 2005: 405–406). Care is taken to distinguish it from the criminal economy which deals in illegal goods and services and the reproductive or care economy which is considered to be outside of the market economy (see e.g., ILO 2002) although there is an acknowledgement that "production or employment arrangements in the informal economy are often semi-legal or illegal" (ILO 2002: 12). The social relations of informal activities may be discerned in three functional typologies: (a) *survival* exemplified by street vending or informal settlements, (b) *dependent exploitation* seen in instances of working off the books, and (c) *networks of micro-producers*, the most referenced example of which is the case of Southern Italy (Portes et al. 1989; Portes and Haller 2005).

The 2004 Inter-American Development Bank (IDB) sponsored study categorized activities in the informal economy in Jamaica into three types:

(a) "Pure" tax evasion, that is, failure to "report earnings from perfectly legal activities carried out in businesses that are properly registered and recorded in the national statistics"
(b) Irregular economy, which is "production of legal goods and services in unregistered and hence untaxed and unrecorded small businesses"
(c) Illegal activities, which are activities outside of regulatory controls such as tax and criminal laws (pp. 163–164)

The size of the informal economy is calculated at a little over 40% of the registered gross domestic product (GDP) of Jamaica and is characterized as ". . .an atomic configuration of economic units that compete individually with each other, in the absence of productive cooperative links and linkages with large firms" (Ibid: 165). The size of the informal economy demonstrates the degree of flexibility in labor market relations and implicates state and governmental capability to provide the

requisite oversight for economic activities. It illustrates the level of independence that attends value-added activities in the political economy as well as the wide scope for individual self-determination. It provides the greatest indicator of the breadth of illegal activities in the political economy.

Economics has a social context and therefore the informal economy is a "self-reproducing social system of coordination and interactions" (Titov 2006, p. 3). This social system "is an integrated whole with its own dynamics and transformation logic" (Ibid). Parsons and Smelser's (1956) general theory of social interaction is one of the earliest assertions of the social underpinnings of economics and through the concept of "pattern maintenance" draw attention to the way in which economic behavior is reinforced by a particular value system that overtime evolve into "institutions." More recently, Portes and Haller (2005) suggest that the first paradox of the informal economy is that, as it takes on the character of a "true market," its effective functioning becomes more dependent on social ties (p. 407). Castell and Portes' (Castells and Portes 1989) comparative rendition is the best known of the empirical studies that engage the social dynamics of the informal economy.

## Social Relations of Informality

Despite portrayal in the literature of mostly economic effects of the informal economy through emphasis on issues such as taxation potential, productivity, and labor costs, there is an acknowledgment of its social impact. Portes, Castells, and Benton (Castells and Portes 1989) reject the notion of a "marginal society" used in reference to the informal economy but admit that "if the informal economy does not generate a distinct society, it does produce specific social effects of far-reaching significance" (p. 31). Thus apart from concerns about its neutralizing impact on the power of organized labor or the blurring of class lines, the operations of the informal economy must affect the sociopolitical outlook of the participating agent or individual. There must arise questions about the values the individual holds dear and the degree to which these are acknowledged in the space he/she pursues his/her life experience. The informal economy provides participating agents/individuals with a first-hand experience of the inability of the formal institutions to meet their needs and guarantee those benefits to which they are entitled through their social membership and participation in the wider political community. The material conditions that contribute to a sense of well-being in the wider society and which are important preconditions for social inclusion are met in the informal socioeconomic space. Through this function, the informal economy facilitates a psychological retreat from the wider society by those who operate within it and the creation of a social world in which actions are subjectively justified. Social exclusion is not simply a function of the social relations of the informal economy, but can result from interactions within the formal socioeconomic space (King and Waldron 1988; Twine 1994). In developing countries like Jamaica, the informal economy incriminates the capacity of public policy to engender an ethos of social inclusiveness given that it is the institutional setting in which unequal distribution of costs to some groups is cushioned as the society progresses. If poverty is the extent of the participating agent's experience, then several things follow: subsistence living, poor education, and low self-worth which are often intergenerational and are the bases for vertically dependent relationships. The informal economy plays counterbalancing roles in the creation of the social person.

The focus on economic survival instills a sense of individualism at the expense of norms of cooperation or social action. A degree of group identification is present that may not appear as sustained cooperative efforts but as a resource that is relied on especially in periods of conflict. Common membership of the informal economy engenders a form of solidarity that acts as an insulator against threats to the economic mainstay and social position of the participating agent. Avoidance of government regulations and taxes or ignoring process norms goes deeper than "beating the system."

These behaviors point to a value orientation that places self-preservation and by extension the current socioeconomic experience of the individual or group at the apex of social and political interactions and the utility of loyalty to a political community is questioned. The quality of the material aspects of the practice of citizenship is fundamental to the development of a sense of connection with the sociopolitical space. The social relations of the informal economy are the context in which this sense of connection is impaired.

## Informal Citizenship

The informal economy is a social substructure that typifies both spontaneous and purposive behavior. It is driven by the logic of economic survival but simultaneously satisfies the need for independence and individuality, empowerment and opportunity for voice, effective leadership, and justice. It substantiates important aspects of belonging and by extension social identity and is a route through which social membership is established. Based on the nature of the social relations of the informal economy, social membership of a political community is not a passive state but involves competition among groups about which set of claims should be given priority. The capacity of a political community to respond to these claims depends on its economic stocks, with some groups being unduly burdened in the choice of claims. The concept of informal citizenship is used to explain how traditional ideas of citizenship are being dislocated by economic transition and the effect on public governance in developing states as well as the kind of competition that is engendered among groups.

Citizenship is variously defined as a status which assures an individual formal membership of a political community and through which the individual enjoys a bundle of equal rights and duties, liberties and constraints, powers, and responsibilities (e.g., Marshall 1973; Held 1989; Janoski 1998). Turner (1993) distinguishes between the juridical and practical aspects of citizenship noting that citizenship defined merely as a collection of rights and obligations (p. 2) does not provide a clear picture of the dynamics of the status in practice. He offers citizenship as a "set of practices (juridical, political, economic and cultural) which defines a person as a competent member of society, and which as a consequence shape the flow of resources to persons and social groups" (Ibid). Turner's (1993) emphasis on "practices" is an important indicator of the sociological underpinning of citizenship status which alerts one to the social constructivist and fluid nature of citizenship (Ibid., p. 3).

The pathologies of public governance have been the platform on which scholars build forceful arguments about the failure of the modern state to fulfil the rights of citizens. A distinction is made between negative citizenship rights (political and civil rights) and positive citizenship rights (social and economic rights) in that the latter requires more overt action by state institutions to be realized. The dynamics of the labor market are associated with the extent to which social and economic rights are realized or eroded even though Twine's (1994) view is that the basis for a social right need not be attached to how secure one is in the formal labor market, but rather to his/her equal status as a citizen (p. 21). Whether or not an individual enjoys structured regular employment does not negate his/her claim to a social or economic right, but equal status does not amount to equal access. The phenomenon of the informal economy is in large measure a consequence of insecurity in labor relations which has bearing on the quality of social membership. An individual's socioeconomic experience is linked to the quality of his/her participation in the labor market as well as the nature of the productive activities in which he/she engages and together are prerequisites for realization of social citizenship rights.

The "practices" dimension in citizenship is the platform on which the notion of an *informal citizenship* is constructed. The status of citizenship removes all sense of informality with respect to one's position in a sociopolitical community. However, being accorded citizenship status does not transmute into substantive citizenship. Implicitly, informal citizenship does not mean the

absence of the politico-legal accoutrements of formal citizenship status, although in some cases this is so. It is a construct used to denote the quality of the experience of the individual designated as a citizen and is thus about the character of an individual's membership in a particular political collective. Informal citizenship is a status acquired through an individual's membership in a social substructure/subgroup with which he/she identifies as the legitimate collective/context in which to pursue those claims normally associated with and attached to formal citizenship status. Informal citizenship resides in that realm of formal citizenship status where particularistic needs (be they political and civil, economic, or sociocultural) are either unmet or under-met and where a subordinated social system assumes responsibility for meeting them. Of course for the sociopolitical system on a whole to retain its legitimacy and functional integrity, the activities of the social substructure have to be nonthreatening. Walzer (1970) notes that if the business of the "lesser" groups is not trivial, then the universal affairs of the state will lose their distinction (p. 221). Informal citizenship does not provide these guarantees given its underlying motive and permutations. The social substructures of the informal economy belie pluralist notion of multi-membership that is complementary. A sense of connection to a political collective or the psychosocial embodiment of formal citizenship status is derived from the manner in which that collective satisfies critical needs and not as a result of the conference of the status because certain criteria are met. These needs though easily identifiable in consumption patterns have a psychological base and are essentially about the individual's social "placement" or "positioning" (Shotter 1993, p. 116) in a collectivity. The functional nature of citizenship suggests that overt actions have to be taken by the individual to achieve this status and depending on the setting for those actions or whether those actions provide the individual with access to fundamental resources will be key determinants in whether (or not) he/she develops a sense of belonging or connection to that political space.

Since membership is the first building block to establishing citizenship, then the setting (economic, sociocultural, political) can condition motivations and shape behavior. The quality of one's membership in the political collective is the salient factor in the development of the "citizen-self" (Janoski 1990). Citizen-self is meant the motivational source of an individual's action within a polity. Janoski (1990) uses seven typologies of citizen-selves, viz., incorporated, active, deferential, cynical, opportunistic, marginal, and fatalistic (pp. 95–98), to represent a citizen's affectual relationship to a political regime (p. 98) and to indicate the range of value orientation and behavior possible. The degree to which the individual accepts the value position of the political system will determine his/her attitude toward it, which may manifest as allegiance, apathy, or alienation. The incorporated and deferential citizens identify with the regime whereas the activist and cynical citizens oppose it. The marginal and opportunistic citizens have little connection to the system and are argued to be more apathetic. Further the fatalistic citizen comes in two forms – fatalistic loyalists and fatalistic opposers, which take no action but have clear value positions (Ibid). The social relations of the informal economy align with the informal citizen typology. The informal citizen-self is borne out of a socioeconomic status that relegates a person or groups to the fringes of society. The sociopolitical affect of this individual or group is instrumental, and thus behavior is guided toward self-interested ends. The value position is transient as it depends on whether goals are being achieved making confrontation with or opposition to the system a possibility. The reality of social exclusion as a product of the informal economy makes the informal citizen-self akin to Janoski's marginal typology, in particular, with respect to the sense of detachment and alienation from the system (p. 98). However, Janoski's view of "low resources and little power to act" does not always apply to the informal citizen-self. Low resources spawn creative means through which access to greater resources is gained and power is leveraged. In this respect the informal citizen-self has some similarities with the opportunistic citizen, particularly the rational pursuit of material interests and the time horizons that guide behavior.

The value orientation and behavior of the informal citizen-self presuppose that a difficulty may arise in incurring obligations (paying taxes, voting, giving military service, etc.).

The construct of informal citizenship finds analytic resonance in postmodern sociopolitical processes in which identity is a function of the needs of the individual as expressed through economic consumption (Touraine 1998, 68 in Misztal 2000, 47). Individuality and informality are analytically and empirically contingent as demonstrated by the transformations occurring everywhere in that as citizens pursue their options independently, there is greater propensity for behavior to deviate from institutionalized norms. Importantly citizenship in the modern state is encased in sociopolitical processes that are trending toward greater levels of informalization making the informal economy and its social formations definitive prospects for the future. Postmodernism yields a "new politics of identity" which is compounded in the informal economy as the individual grapples with creating the opportunities that will give meaning to his/her life.

Finally, citizenship status is an assurance of an acknowledgment by the state or its authorities of an obligation to protect the individual person and private life. The group of citizens which may be so designated by birth, residence, or consent is distinctive in that it, and no other group, receives protection from the state (Walzer 1970 p 206). As a corollary the citizen is expected to acknowledge an obligation to the state through expressions of obedience (obey laws) and assumption of responsibilities (perform duties). By virtue of its size and the scope of its activities, the informal economy in developing countries especially given the existence of weak formal institutions has created a social and economic space that engenders the formation of substructures and the proliferation of informal institutions that are gradually assuming some of these functions. The notion of an informal citizenship is developed to illustrate the complexities that inhere in contemporary social membership. Thus, whereas formal citizenship status subordinates individualism to universalism and subculturalism to nationalism within the state; informal citizenship is the obverse. It is where there is alienation from the broader collectivity and where social cohesion in the society, economic citizenship, and loyalty to the political system are replaced by spontaneous emergence of particularism and individual self-determination. Contemporary public governance is faced with the fundamental challenge of transforming informal citizenship into economic citizenship. To do this, contemporary public governance must be endowed with certain primary capacities: the capacity to be responsive to the needs of its citizens, the capacity to coordinate the actions of multiple participants in the process of governing, and the capacity to regulate the behavior and actions of all "actors" in the collective for sustainable and equitable outcomes. In the absence of these primary capacities, the informal economy will be the alternative context in which a new citizen-self finds sustenance which finds expression in the concept of an informal citizenship.

## Conclusion

The modern state is the largest and most inclusive group that legitimizes an individual's membership in a political community but continues to experience significant changes in its constitutive elements – its boundaries (spatial and social), its legitimacy, as well as its capacity which altogether implicate its protective functions and its centrality to the human experience. These structural changes combined with a wider process of informalization create the context for different social responses where individual actors perceive relative freedom to interpret and determine the scope and content of their actions. The informal economy is context in which this process of social transformation occurs and which produces an informal citizenship.

The concept of informal citizenship is an outcome of the social relations of the informal economy, which in turn is an unintended consequence of contemporary public governance. The idea of informal citizenship departs from the one-dimensional interpretation of informalism and focuses instead on the capacity of the informal economy to engender values that have the potential to undermine social and political order. The informal economy evolves a set of social relations

that is functional in nature: they are a source of autonomy and individualism while proliferating the activities that are undertaken in that "space" and the attitude and behavior that accompany them. Informal citizenship is a function of the quality of public governance.

## Synonyms

Institutional governance; Political institutions and wicked problems; Politics and public policy

## Definition

Informal political institutions embody norms and practices, either legal, a-legal, or illegal, occurring outside the frame established by a political constitution and its auxiliary legislation; although unwritten, they are well known to political actors and are enforced in their social interaction.

## Introduction

Political scientists developed the concept of informal political institutions to refer to an institution operating outside of the formal rules established by a political constitution and its auxiliary legislation. Among the many political behaviors that

can escape formal regulations, however, only some of them conform a political institution. We devote the following discussion to identify their characteristics. First, regarding the political field, we discuss the concept of informal political institutions based on a review of North's definition of institution, a condition to understand political institutions in general as well as informal political institutions. In a second part, we analyze the relationships between formal and informal institutions and illustrate some of its applications and functions in political systems. In the third and last part, we discuss the main methods for studying informal political institutions, as well as the implications and drawbacks of each methodological approach.

## Institutions, Rules, and Incentive Structures: A General Approach

Political institutions have gained currency since the 1990s in the analysis of economic life as well as political processes. A large part of this flourishing has been associated with the contributions of Nobel laureate Douglass North (1990), whose work on economic institutions set the ground for the development of this approach, making it an unavoidable reference for any discussion in this field. North defines institutions as "the rules of the game in a society or, more formally, the humanly devised constraints that shape human interaction" (North 1990: 3). And he immediately asserts that "they structure incentives in human exchange, whether political, social or economic" (North 1990: 3). Moreover, introducing a dynamic dimension to this analysis, he argues that "institutional change . . . is the key to understanding historical change" because institutions shape societal evolution (North 1990: 3).

Indeed, North is concerned about economic, social, and political change and the way institutions condition observed outcomes. In this sense, the reference to the "rules of the game" is to be understood here closely to Ostrom's (1986: 7) formulation in terms of "the means by which we intervene to change the structure of incentives in situations." An existing rule – formal or informal – is not always an actual institution, because political actors may comply or not with that rule. Rather, an institution takes form as a recurrent pattern of interaction that establishes a structure of incentives, where rules effectively define accepted behaviors and also establish sanctions for breaking the rule.

In spite of North's (1990) claim that institutions organize political, social, or economic life, his elaboration in terms of incentive structure finds its most direct application in economy. North derives institutions from his criticism of rational behavior assumptions associated with neoclassical economics, stressing that they would hold only in a world without transaction costs: "when it is costly to transact, institutions matter" (1990: 12); and even more precisely, "only in the absence of transaction costs did the neoclassical paradigm yield the implied allocative results" (North 1990: 26). According to North, transaction costs are not to be disregarded in economic life; indeed, the more complex the economy, the larger the uncertainty and the higher the transaction costs. Institutions then reduce uncertainty in complex societies by structuring human interaction.

North's application of this institutional approach to the political field takes as its starting point the same contribution that institutions make to reduce uncertainty in complex contracting. At the most general level, formal political institutions are a synonym of the rule of law, comprising the constitution and the set of legal regulations actually enforced in a given State. In democracies, formal rules are the result of the legislators' work which, in turn, is affected by the interests of multiple groups that comprise the legislators' constituency. Competition among groups of interest establishes a key difference between politics and economy, so "democracy in the polity is not to be equated with competitive markets in the economy" (North 1990: 51). As a consequence, the interplay between formal and informal institutions' cannot be disregarded in the political field. Moreover, informal institutions can survive changes in formal rules; this is not necessarily a positive trait but a hindrance to uncertainty reduction, as they result of a distorted incentive structure.

North (1990) made clear his preference for the formal institutions over the informal: in his view, complex societies should have more effective formal institutions taking the place of informal constraints, for instance, the gradual shift from status to contract. Informal institutions are then prominent in low-complexity societies in part because individuals belong to dense social networks, making transactions costs minimal (North 1990: 120). In this dynamic framework, informal institutions find their place as the counterpoint of formal institutions in an evolutive process where formal rules take over the informal. Although North recognized the function of informal rules in supporting formal agreements, he did not elaborate on their interplay nor gave the informal a specific function in the polity.

## Formal and Informal Political Institutions

Helmke and Levitsky (2006) discussed the relationship between formal and informal political institutions in the context of Latin America democracies since the 1980s, stressing their contributions and threats to democratic outcomes. Helmke y Levitsky define informal institutions as "socially shared rules, usually unwritten, that are created, communicated and enforced outside officially sanctioned channels" (2006: 5). By contrast, formal institutions' distinctive trait is their dependence on "channels that are widely accepted as official." There are many differences between this definition and the general treatment of institutions proposed by North that must be considered before displaying their operation. We shall address the following: they are not a culture, they do not refer to any norm-deviating behavior, they are not secret agreements, and they are also present in consolidated democracies.

First, some understanding of informal institutions, especially in North, conflates them with culture and tradition, that is, "conventions and codes of behaviour" (1990: 4). The origin of informal constraints has to be searched for in socially transmitted information that conform "customs, traditions and codes of conduct" (North 1990: 6). The concept of informal political institutions as developed in political science departs from North's conception in terms of informal rules rooted in culture or tradition, because behaviors associated with an informal institution may not be rooted in broader social values but in particular group beliefs.

Informal political institutions do not correspond to any behavior deviating from rules written in the political constitution or auxiliary legislation. Specific origins of informal institutions and strategies followed by political actors to intentionally change the structure of incentives might be a result of formal institutional design, or a creation parallel to it. Weak political institutions can make flourish opportunistic or abusive practices that are not informal institutions, but adaptive behavior resulting from wrong incentives or lack of enforcement for official rules. Pork-barrel politics for instance might be an outcome of failing planning and control, rather than a rule of resource allocation. Moreover, informal political institutions are not always illegal practices, even in a context of strong political institutions.

Informal political institutions do not correspond either to "extra-institutional" features of political life, such as "iron rings" or "factual powers," evoking secret agreements among powerful actors escaping public scrutiny. By contrast, informal institutions make integral part in the operation of the political system and are widely known in the polity. Indeed, agreements among a few do occur and are known to expedite political decision-making; however, leaving aside some political actors threatens the deepening of democracy.

Although informal political institutions have been studied mostly in weak polities, they also have been documented in consolidated democracies, such as the United States and the European Union (Farrell and Héritier 2003; Azari and Smith 2012). Phenomena such as the use of personal contacts in decision-making, patron-client relationships, or informal negotiations are by no means confined to less developed political systems. Informal political institutions express underlying rules of the political field which modify the incentives established by formal institutions.

In the case of Latin America, Helmke and Levitsky (2006) also take issue with the view that informal institutions would undermine democracy; although this could be true in some cases, they can also strengthen democratic performance. For instance, local interests or minorities disregarded by formal institutions can take advantage of informal institutions. Similarly, informal institutions can enhance governance by helping to overcome policy failures or institutional conflicts (Siavelis 2006). There is a downside and exclusionary political practices are a good example of the double edge of informal institutions: despite their convergence with legitimate political outcomes, exclusion of social or political actors can result in political unrest or lack of legitimacy.

Finally, enforcement of informal rules is a key to identify informal institutions. An informal behavior, such as engaging in small chat with a public servant, does not correspond to an informal institution unless there is an enforcement mechanism associated with that behavior. Enforcement of informal rules operates through the patterns of social relationships between political actors: breaking an informal rule makes the individual accountable to other participants in the political field. In fact, informal political institutions have their own enforcement mechanisms usually related to group exclusion or deterioration of individual reputation (Lauth 2000). Ostracism and bad reputation reduce the opportunities a political actor has to make agreements with other. Indeed, disregarding informal institutions will probably obstruct the effectiveness of political actors.

In summary, informal political institutions establish steady patterns in the interaction of political actors because they consist of more than a temporary fix to an institutional malfunction. According to Carey and Siavelis (2006), political actors as well as the media are widely acquainted with informal political institutions, making them part of their analysis and calculations. As a consequence, the stability of informal institutions makes it necessary to consider their relationship to formal institutions in the shaping of a complex system of incentives. According to Ostrom (1986), rules in a polity have a configurational or interactive character, that is, a rule does not always lead to the same outcome, because it is affected by other rules. Hence, the need to examine a set of rules rather than separately to understand their consequences.

## Informal Political Institutions and Policy Outcomes

Deepening in the relationship between formal and informal institutions, their interaction effects a change in the structure of incentives of the polity, that is, the outcome associated with a behavior in a given institutional context. Several typologies have been proposed to describe the relationship between formal and informal institutions (Azari and Smith 2012; Lauth 2000). The most comprehensive analysis has been developed by Helmke and Levitsky (2006) who proposed a fourfold typology based on convergence of the outcomes between formal and informal institutions and degree of enforcement of the formal institutions. According to this classification, there are four types of informal political institutions: complementary, accommodating, substitutive, and competing.

A complementary informal institution corresponds to a situation where formal and informal rules converge in the outcome and formal rules are effectively enforced. Actors here intend to enhance the operation of formal institutions by overcoming contingencies. Informal rules can create incentives to comply with the formal or they can facilitate coordination or decision-making. As an example, Chilean parliamentarians can make use of their influence to enhance disadvantaged local governments in their districts with extra technical support, thus correcting inequalities in the policy-making.

Accommodating informal institutions correspond to a situation of divergence in the outcome of formal and informal rules in a context of effective enforcement of formal rules. The informal institution alters the effects of the formal rule, but it does not violate any regulation. Political actors may agree on norms to share power, bending the rule without breaking it. The use of a political quota to fill government positions can be legally widened to a great extent. On the bright side, some justify this practice as an aid to

coordination; on the dark side, politically based appointment could approach arbitrariness and also couple nepotism.

Substitutive informal institutions correspond to a situation where the effects of the formal institution converge with the informal, but formal rules have a low degree of enforcement. In some contexts, patron-client relationships may substitute for weak representation systems. Indeed, patron-client relationships usually go hand in hand with illegal or barely legal practices such as logrolling, bribery, and other forms of corruption.

Finally, competing informal institutions refer to situations where the informal rule does not converge with the formal and formal institutions have low effectiveness. Formal and informal rules are incompatible and by following one rule, the actor breaks the other. Informal administration of justice would be an example of this situation, generalized corruption, another.

This typology as well as others has been criticized because the same institution can be classified in different types, depending on the context. For instance, clientelism can be either a substitutive or competing institution. Authors argue that the focus should be placed on the characteristics of the relationship between formal and informal rather that the label. As an advantage, a relational formulation leaves aside the functional view in terms or institutional gaining. Ostrom faced a similar problem when analyzing the interaction of multiple sets of rules. Her recommendation to focus on the relationship between sets of rules and the changes in the structure of the situation is worth taking into account in this case: "Classifying rules by what they affect enables us to identify sets of rules that all directly affect the same working part of the situation" (1986: 20).

## Methods for the Study of Informal Political Institutions

Regarding methods for studying informal political institutions, any empirical strategy has to overcome the difficulties to identify them, that is, to distinguish an informal institution from practices and behaviors deviating from formal rules. Two strategies could be followed to this end: a nominalist and a realist approach. In the former, more related to quantitative methodologies, the researcher can use institutions known from another context as a starting point to ascertain its character and operation, for instance, earmarking, patron-client relationships. The main limitation of the nominalist strategy would be its disregard for institutions that had not been identified in other contexts, although the researcher can proceed by analogy. In the latter, more related to qualitative methodologies, researchers focus on behaviors deviating from formal rules to identify unwritten rules and informal institutions; this is a somewhat inductive strategy, akin to qualitative approaches generally based on ethnographic observation or collecting the discourse of actors.

Either way, nominalist or realistic approaches to informal institutions demand detail knowledge of political communities and the behavior of political actors. Getting to know how political actors "make things happen" – voting, decision-making, resource allocation – is usually a good guidance to find informal rules. Identifying enforcement mechanisms for informal rules shall help the researcher to characterize the informal institution. Since sanctions for breaking the rules involve some form of social foreclose, political actors that experienced loss of their political standing make usually good informants of the inner works of the political field. Indeed, focusing exclusively on sanctions can disregard institutions where enforcement is not necessary.

An analytical difficulty derives from the configurational aspect of rules. To become an institution, rules do not operate in isolation but interact with other formal and informal rules. Moreover, informal institutions cut across multiple levels of action, individual, organizational, territorial, social, economic, and political, which should be one of the main points of observation of researchers: disentangling the interplay of rules and levels of action requires careful considerations of the outcomes associated with actions and participants. Comparative methods would help to sort out patterns in complex situations.

Also, a nice research setting for before and after studies would occur in cases where formal rules –constitution or legislation – suffer a change. Methodologically, describing the evolution of informal institutions presents a set of challenges,

though including a synchronic dimension might be of interest, because of the importance of quicker institutional change nowadays, in a context of frequent political scandals, and greater public scrutiny. Altogether these point against slow institutional change, as posited by North. Archive analysis or path dependence analysis for slower changes or comparison between periods or different moments in time might be useful in this case.

Finally, an experimental strategy to study informal institutions, especially based on game theory, does not seem adequate because of the configurational aspect of rules, which are applied in closed communities though they can be adequate to study incentive structure. Political actors have different motivations to lay out informal rules that give birth to informal institutions; their motivations might range from helping to improve the workings of the political system to narrow interests, even approaching corruption. However, it would be possible to move further in the formalization of the structure of incentives associated with the operation of informal institutions. Providing specific hypotheses would allow for the statistical treatment of this topic.

## Conclusion

In recent decades, we experienced a shift from the idea that informal institutions are a remainder of a traditional society, although they might be historically contingent, to a new comprehension of the multiple functions they fulfill, even in modern democratic regimes. The debate on informal political institutions helps to understand the interplay between formal and informal aspects of governance. On the dark side, informal institutions may couple with state failures and weakening of the rule of law, through practices such as corruption, nepotism, and social violence. On the bright side, informal political institutions can enforce governance and the rule of law, complementing or supplementing state functions. Informal institutions can channel organizational innovation, accountability, and control of authorities. As a consequence, by focusing only on formal institutions, an analyst risks missing crucial aspects of social and political change in the making. The challenge in the analysis of informal political institutions remains discerning the contribution they make to democracy and institutional development.

| Informational differences | Refer to witnessed smooth dissimilarities of opinion and knowledge among the employees. |
| Divergent opinions | Refer to thinking in an unusual and unstereotyped way, e.g., to generate several possible solutions to a problem. |
| New knowledge value | Is when employees observe how new ideas, knowledge, and innovations are formed from divergent opinions in an organization. |
| Novelty experiments | Are unique trials that have the potential to become seeds for unprecedented organizational action. |
| Policy | Is a course or principle of action adopted or proposed by an organization or individual. |

## Introduction

Organizations need information to support the key aspects of running their entities, such as communication, record-keeping, decision making, data analysis, and more. Organizations use this information to improve their business operations, make strategic decisions, and gain a competitive edge. Good information is essential for effective operation and decision-making at all levels in businesses. Management identifies and illustrates the different kinds of information by the complex internal and external communication links of different functions of an organization (Goldstein et al. 2010). Managers use information to clarify roles and tasks; decision-making processes (strategic and operational); rational and alternative behavior; and cognitive style and perception. The effective symbolic use of information is power. Information helps in avoiding the duplication of scarce resources. Information stimulates the thought process of the users, particularly top management and employees. Information about what is happening in the system and in the ecology is widely distributed among individuals and not immediately accessible for organized solutions. It implies that the system (the organization) is not in position to organize, gather, interpret, synthesize, and disseminate information effectively as a system. Although organizations may have sets of information, different employees attach different meaning which causes informational differences. Previous studies explored informational differences as the amount of information employees have about the markets. Managers assumed that employees have identical information sets, attach the same meaning irrespective of their backgrounds, and that the conditions of information are similar (Diks and Dindo 2008). Over the past few years, there has been a growing interest in informational differences and its predictive potential to enhancing innovation in organizations.

Informational differences refer to witnessed smooth dissimilarities of opinion and knowledge among the employees. In this case, informational differences are so named to reflect Bateson's (2000) well-known definition of information as a difference that makes a difference, in other words, the diversity that fuels creative innovation. The management and employees attach value of dissimilarities in opinion and knowledge that influence their understanding of the business environment, and develop collaborations that connect them to formal and informal resources (Hazy and Uhl-Bien 2015). Informational differences amidst unfolding series of events acquaintance tend to generate opportunity tension,opportunity recognition, trigger opportunity evaluation, and consequently opportunity exploitation.

Informational differences are conceptualized as the real information (not mere data) which is new information. This new information comes out of differences: differences in perspectives, experiences, mental models, et cetera. Thus, informational differences can be considered as the nature and quality of the network of human connections, communication capacity, as well as how cognitive capacity of individuals within an organisation together form another independent constraining factor to achieve the desired objectives (Quintane and Adam 2011). Informational differences lead to some people being better informed on how desirable outcomes can be achieved than others (Bohnet and Saidi 2019).

Organization leadership that develops enabling initiatives which are linked together as a host of internal processes including human resources, finance, procurement, and information technology, gives these functions added connection to the world outside. All of these initiatives help to bring information into the organization so that informational differences could be exploited down the line. The improved exploitation of informational differences encourages experiments in novelty to exploit internal and external opportunities. At the same time, high levels of connectivity enable vital exchanges of information about opportunity tension felt across the organization. Conditions are that, when opportunity tension interacts with informational differences, it generates criticalization for the cusp of change. In the cusp of change, outcomes are not certain and individuals, even executives, can experience a great deal of uncertainty. Employees feel opportunity tension, but at the same time they are also limited by informational differences which at first appear as differences in perspectives and disagreements in interpretation. Thus, both opportunity tension and informational differences are important factors for leadership to manage during these difficult periods (Mayanja et al. 2019).

The emergence of new attractors is referred to as bifurcation, and the path leading up to the transition to a new attractor is termed criticalization. The movement toward the emergence of innovation in organizations is known as a criticalization within a bifurcation scenario. The particular attractor(s) that defines the system is determined by the conditions constraining the system. For example, the two constraints, namely certain levels of opportunity tension and informational differences across the organization, plus the routines, norms, and functions that have developed in the organization over the years, would determine the attractors operative in the organization. The organization becomes better at making effective use of informational differences through experimentation. Whereby an originary attractor (s) representing "business as usual" gives way to new attractor(s) representing social innovation. The originary attractor can be thought of as a mathematical encapsulation of the inadequate prevailing governmental, organizational, and community resources including existing routines, practices, capabilities, social networks, and other facets of "business as usual." Mathematically, an attractor is understood as stable when small changes in the values of system variables normally do not affect the attractor or lead to criticalization. As the parameter values described above change, the social system can cross such a threshold as not just one but now two attractors that exist simultaneously, since a new one, represented by the knobs in the wells moving from the left to right, is starting to arise in phase space – the second attractor gaining ascendancy as we move from left to right. The minimum point on the curve implicitly represents the attractor for the system that actually includes the combined behavior of many possible variables that are not shown. The first attractor, still hanging on, reflects continued organizing in the old way of doing things. The second is a new way and reflects a different approach to organizing that exploits the possibilities in a better way. The process will go through five panels from the first attractor which is the minimum point of the graphic (Panel 1), through the emergence of a new attractor (Panel 2), passed by a place where two attractors, A1 and A2, are equally strong (Panel 3). The process continues in reverse as the initial attractor diminishes into a small dip (Panel 4) and finally the new attractor (Panel 5) comes to dominate activities within the organization. This wave of change from initial attractor to new attractor that ends up dominating takes place because of informational differences (Fig. 1).

## Measures of Informational Differences

### Divergent Opinions

Divergent opinions and disagreements create freedom among employees to make use of their ability and judgment innovatively, even when they deviate from the norms. When employees deviate from the norms, they are capable of boosting

**Informational Differences in Organizations, Fig. 1** Adopted from Goldstein, Hazy and Linchtensein (2010)

their creativity while addressing prevailing challenges generate more spontaneous ideas, come up with new experiences, and venture creations (Kibirango et al. 2017). Divergent opinions develop a high degree of resonance interaction and not predation that requires individuals with different backgrounds, and sets of experiences, to connect in a very meaningful way to access resources from entrepreneurial network. However, Mertens and Recker (2017) argue that a common assumption in most of these studies is that divergent opinions emerge spontaneously with elements of the environment, the person, or the interaction between both making this emergence more or less likely.

Carnevale et al. (2017) argues that leaders can also actively stimulate divergent opinions, where managers have leadership skills, which may not be the case among small organizations in developing countries because of bureaucratic culture. In this case, heterogeneity, the vast diversity of components, agents, and parts involved in an ongoing variety of distinct interactions with others, is one of the important features of complex leadership systems that manage employees with divergent opinions. This is true for an organization with the presence of leadership that can operate and coordinate different individuals with different backgrounds and information (Frese and Gielnik 2014). This is still a challenge among individuals who happen to possess opposing viewpoints since it is difficult to challenge the structures of small organizations where the business owner is likely to be part of every decision made.

Vadera et al. (2013) proposed that employee empowerment leads to divergent opinions and that empowerment can be stimulated by transformational leadership behaviors: inspirational motivation, idealized influence, individualized consideration, and intellectual stimulation. They argue that these behaviors demonstrate to employees that honesty poses no risk, which creates the psychological safety and strength that allows employees to engage in positive deviance. The SME owners/managers need management and type of leadership that can operate and coordinate different individuals with different backgrounds and information to access resources. This in turn allows employees with divergent opinions to interact with different network actors to access intangible and tangible resources when management creates enabling environment (Kibirango et al. 2017). SME managers need to learn from organizational structures about managing divergent opinions if they do strive in competitive environment. Divergent opinions play a primary role in determining the kind of networks and individuals to connect with to access resources for business competitiveness.

### New Knowledge Values

New knowledge values are when employees observe how new ideas, knowledge, and innovations are formed from divergent opinions in an institution. Employees value existing opinions and knowledge dissimilarities among themselves. Employees, who notice and observe new ideas, create new knowledge for innovations and attach different meaning to information. Employees, who notice and observe how new ideas, knowledge, and innovations evolve, are likely to attach different meaning to information. Without new ideas, employees with no information differences, social network agents would disseminate the same information within the organisation. However, organization employees tend to have difficulties to join different entrepreneurial networks to access resources because of inadequate management of new knowledge values (Mayanja et al. 2019). It is worth noting that not all managers have leadership skills to manage new knowledge values. This means that managers need to develop leadership skills if they are to manage new knowledge values arising from employee differences.

The new knowledge value created by management and employees help in identifying new opportunities, which are exploited using the interactions, ties, and networking style within entrepreneurial network. When managers and employees share with one another the information and meaning attached to differences in perception, this is likely to influence the choices and actions that connect people and create new knowledge (Von Krogh et al. 2012).

When managers and employees value new knowledge, management puts systems in place to gather information that can support access to resources from networks. The administered informational differences (AID) foster these "events" to be known, get selected, and then reinforced through series of additional events. Employees with that type of AID are key antecedents for entrepreneurial networking. Informational differences can generate opportunity tension in an organization that needs resources and social support from networks (Goldstein et al. 2010).

Informational differences facilitate organization learning as employees learn from each other the tools for personal discovery. This platform can be used to promote rational thinking and creativity by adopting practices from one another. Employees tend to be informed when they learn from their social network agent's differences depending on an enabled environment, which provides a platform for enhanced rational thinking and creativity about accessing resources and mitigating negations from network members.

### Novelty Experimentation

Individuals, with uncommon sets of experiences and information, connect in a very meaningful way to have novelty experiments. They generate and share informational differences in ways that will move the organization's members from an old attractor to a new one. But for this to happen, the organization's members must first see the benefit accruing to them of making the change. They must recognize that there are two options for them, either staying with their current daily activities and thereby sticking with their earlier attractor, or choosing to band together with others to try a different strategy with a greater promised payoff, jumping, if you will, to a new attractor (Mertens and Recker 2017).

Informational differences arise simply due to the different working of different markets. Each market may need a different approach based on the information available. Informational differences influence the transformation process of any organization if it is to achieve its objectives. Transformation requires a high degree of opportunity tension, a pressure for others to come along, that is, to join the team and organize cooperatively, and a condition where there is a great deal of informational differences, i.e., many different experiments in novelty, which is capable of being acted upon due to enough resonant connectivity. Both the movement toward team interaction and the experimentation in novelty within the group are important, because they allow the group's members to learn from one another and to move together as a team rather than as individual agents. Organizations with generative leadership are an encouragement of experiments in novelty as a way to generate and share informational differences in ways that will move the organization's members from an old attractor to a new one. But for this to happen, the organization's members

must first see the benefit accruing to them of making the change. Management and employees must recognize that there are two options for them, either staying with their current daily activities and thereby sticking with their earlier attractor, or choosing to band together with others to try a different strategy with a greater promised payoff, jumping, if you will, to a new attractor (Goldstein et al. 2010).

## Challenges of Managing Informational Differences

(i) Informational structures – organizational structures may not allow smooth flow and sharing of information, sharing experiences, feedback, and attaching meaning. This could be based on failure to align employee attitudes, behavior, and organization structures to learn from each other to achieve organization competitiveness through innovations.
(ii) Managing the transition of attractors – new opportunities arise over time. Stimulating niche development at the microlevel, finding new attractors at the macrolevel by developing a sustainability vision, creating diversity by setting out experiments, and selecting successful experiments that can be scaled up may not be embraced by all employees.
(iii) Recombination between advances in technology and practical genius – the aggregate effects of recombined technologies from different sources may cause to overlook the negative effect of recombining firm-developed technology in generating breakthrough inventions and organization learning by attaching meaning to events and feedback.
(iv) Lack of generative leadership to coordinate, harmonize different perspectives, opinions, and information from employees to attach meaning for strategic thinking and planning to attain competitiveness.
(v) The organization may have inadequate capacity to create a conducive environment for innovation and creativity in absence of flexible structures, policies, and systems to manage administered informational differences (AID).
(vi) Management may fail to harmonize information due to differences in individual backgrounds, skills, opinions, perspectives and surprises from events, experiences, and experiments, which help to drive innovation.
(vii) Managing departures from currently accepted and conventional ways. Not every management innovation creates competitive advantage. Traditional management principles, processes, and practices or a departure from customary organizational forms may significantly alter the way the work of management is performed; therefore, employees may end up resisting it based on the different meaning attached.

## Strategies of Managing Informational Differences

In order to tap into the potential of information differences, organizations should create favorable policies, processes, and systems to enhance creativity and innovation arising from differences in opinion and ideas. In addition, organizations operating in a complex business environment should often carry out their operations in a consultative and inclusive manner to cater for the deviant views of the different stakeholders. Organizations, with positive deviants, should cultivate a culture of team work and networking in executing their operation. This will enable individuals with different views and opinions to be listened to and add value to the organization processes and outcomes. Last, organizations should instill the discipline of respect of other members' views in their debates at work environment. This will encourage individuals to suggest new ideas and views different from others to grow and develop the organization.

## Recommendations

Management and employees tend to learn from informational differences, and at the same time endeavor to share their conceived ideas. Even

when they tend to instigate one another from their respective positions, their creativity and innovativeness cannot be enhanced without a conducive internal environment. However, employees should be empowered through a degree of freedom along with tolerance of trials and error type of governance; as such opportunistic surrounding landscape promotes innovation.

Organization leadership and employees should understand that emerging new ideas originate from divergent opinions and disagreements within the institutional situation. It is the employees' divergent opinions that motivate organization's members to organize in new and different ways, and new structures would emerge to address complex situations that are not routine.

The huge amount of difference that distinguishes an individual employee from another in a given organization structure is another opportunity to engage novelty to address such nonlinear interchanges of information. The divergent views emerging from various or double interactive connections are beneficial to organization if favorable policies, structures, and governance are put in place. Organization environment enables interactions and intersections, and in so doing, exhibits various transport rates of nutrients, information, and wastes.

Experimentation with learning in mind, networking, interactions, and adaptability is key to organization networking. This, therefore, requires the trial and error type of governance with tolerance by management. Such degree of freedom not only stimulates innovative employees' behavior, but it is also a learning experience from which ideas are examined before adaption. To ensure such experimentation, organizations should endeavor to develop relevant policies and flattened structures (novelty ecosystems). These are required to guide the revolutionary process or avenues. Employees, who are empowered through a conducive working environment, engage in sharing opinions generated from experimentation practices.

In this case, organization leaders ought to provide a flexible platform for enhanced rational thinking and learning. Positive deviance is used to develop interventions and implementation process based on the successful behaviors and strategies of individuals at risk. Despite their circumstances, they perform better than their peers do.

### Synonyms

Infrastructure and Governance

### Definition

Infrastructure policy is the set of governmental actions, guidelines, principles, legislation, and other instruments, regarding the physical assets and public services supporting the country's systems for transport, energy, telecommunications, and water and sanitation.

### Introduction

Infrastructure plays a crucial role in a country's economic welfare, as it raises productivity and living standards. For less developed countries, the effects of public infrastructure investment on economic performance tend to be substantially higher, since the capital stock of infrastructure for these countries is lower than in developed countries (Pereira and Andraz 2013).

According to the World Bank, Brazil's stock of physical infrastructure is smaller than that of most countries with a similar income level. This is particularly the case for transport and water and sanitation. Yet access to electricity and telecommunications is mostly on par with other middle-income countries (Raiser et al. 2017). In 2015, more than 40% of households had no access to sewage treatment, and more than 15% had no access to treated water via the general network. Brazil has approximately 17.5 times fewer roads per square kilometer than the USA, and the country's rail network is barely 15% of the size of the rail networks in the USA and China. On the other side, more than 90% of the population has access to electricity and cell phones (source: Costa and Bertol 2018) (http://www.brinknews.com/brazils-great-infrastructure-opportunity/).

Efforts of the federal government in the past years (especially from 2005 to 2014) were remarkable, although insufficient, in order to boost infrastructure investment, especially for the transport and electricity sectors. Examples of that are the Investment Pilot Project, launched in 2005; the Growth Acceleration Program (PAC), implemented in 2007; the Logistics Investment Program (PIL) of 2012; and most recently the Partnership and Investment Program (PPI), which was established in 2016.

In spite of the importance of these policy initiatives, these projects collectively have never accomplished more than a small fraction of targets set out by these programs. The results presented are, at best, mixed (Machado et al. 2018), as only part of the total resources allocated to investments projects in the sector has been converted into stock of capital or services for society. For example, the major investment projects implemented by PAC have delayed and cost more than planned, and the services were not always delivered with the expected quality. From a sample of large-sized works of the program, comparing estimated terms and costs, there was an average increase in costs of 50%, and average completion time more than doubled (Frischtak and Noronha 2016). Broadly speaking, we can claim that infrastructure policy implementation in Brazil has been marked by poor performance.

However, it is important to point out that time delays, budgetary overrun, and benefits deficits in infrastructure policy implementation are not only a Brazilian problem. International researches have pointed that the underperformance of large

infrastructure projects is remarkable around the world. Flyvbjerg (2007) used a database of more than 2000 large energy and transport projects that were implemented in 104 countries on 6 continents over the period from 1927 to 2013. The research demonstrated that 80% of these projects were marked by budgetary overrun and 40% did not deliver the expected benefits. According to the author, the implementation of these projects is also notable by delays and social and environmental miscalculation. Yet in the current Brazilian case, the greatest obstacle to infrastructure policy is the low state capacity for planning and governance of infrastructure policy (Gomide and Pereira 2018a).

## Infrastructure Policy in the Last Decades

In Brazil, infrastructure policies have been traditionally led by the state for both planning and investment. In this sense, the years between 1964 and 1980, marked by a developmental agenda, represent the peak of public investment rate in the country (Orair 2016). During the 1970s, investment rates in infrastructure in the country exceeded 7% of GDP. This investment was focused on the priority sector for economic growth, especially the energy and transport field. By that time, the Brazilian government also strengthened the state apparatus for infrastructure planning and implementation, exemplified by the creation of the Brazilian Transport Planning Enterprise (GEIPOT) and the consolidation of *Eletrobras* subsidiaries, a state-owned energy planning company, throughout Brazilian geographic regions (Machado et al. 2018).

In the 1980s, a severe fiscal crisis halted the state as the investor in the sector. Hence, the decade was featured by the stagnation of investment in the sector. In addition, several infrastructure projects planned in the previous years, such as the construction of large hydroelectric plants and road pavements, were postponed. Consequently, during the 1990s, processes of privatization and regulatory reform were conducted by the government, followed by the creation of autonomous regulatory agencies, in order to attract private capital to fill the gap of investments in the sector. These policies have worked relatively well for telecommunications and electric energy but felt behind for transportation and water and sanitation. According to the World Bank (Raiser et al. 2017), Brazil has boosted its telecommunications infrastructure over the past 20 years, and the country has more installed electric capacity than the average country in the LAC region. However, road and rail infrastructure stocks have barely grown since 1990, and the country's road density has fallen slightly when compared to other middle-income countries. Regarding water and sanitation, figures are lower than in any of the comparator countries except India: between 1990 and 2010, access to improved water has increased by about 6%, and access to sanitation facilities has increased by about 25%. The Bank report explains this variety of performance across sectors by obstacles to the full recovery of user costs by the private sector, since this is easier for telecommunications and electric power and difficult for transport (especially for railways and ports) and water-sanitation.

From 2006 to 2011, state fiscal capacity to invest in infrastructure was recovered (Orair 2016), and governmental efforts were planned to boost investments in the sector. Thus, a number of flagship programs were launched with the objective of increasing public investment rates and improving the quality of public services. As a result, public investment in infrastructure increased from 1.6% of GDP, in 2006, to 3.2% of GDP, in 2010. Despite that, the National Confederation of Brazilian Industry (CNI) claims that it is necessary to invest at least 4% of the GDP during 20 years in order to eliminate Brazil's infrastructure gap.

While initially successful, these programs became much less effective once they were expanded. Disbursement data showed a gap between the commitment of funds and their effective disbursement. The federal government and other SOEs executed less than 30% of the planned investment expenses between 2001 and 2015 (Raiser et al. 2017). Therefore, the relatively unsuccessful experience of Brazilian infrastructure policy in recent years demonstrates that the

lack of fiscal resources was not the only binding constraint on investment. The problem derived from the limited overall state capacity for the governance of complex projects (Gomide and Pereira 2018b).

The Brazilian Development Bank (BNDES) has traditionally offered the most subsidized source of financing, and projects did not suffer from lack of financing during 2005–2014. However, in face of fiscal crises, President Temer's administration has made a radical change in their subsidized financing policies. Nowadays, BNDES makes available a minority of any given project's financing needs. The new financing policy opened more room for private capital, especially for international investors, particularly large investment funds.

Consequently, concessions and public-private partnerships (PPPs) have a role for financing and delivering infrastructure in the country (according to Brazilian law, PPPs are concessions in which part or all of the concessionaire's compensation is paid by the government and does not come directly from the revenue gained through the service or work at issue). Moreover, Brazil has been pursuing opportunities for partnerships with the private sector with the aim of filling infrastructure gaps. Nevertheless, pure Greenfield projects, such as new railway construction, in which there is no existing cash flow, remain difficult to finance, but investors show interest in existing assets (such as airports and highways). Moreover, it is important to remind that without the participation of the state in guaranteeing the quality of projects and coordinating and regulating of agents, private investment is not carried out.

Finally, it is worth mentioning that some "risk factors" such as regulatory, environmental licensing, foreign exchange, and other risks often lead to difficulties in the feasibility of investment projects. In many cases, there are financial resources, but there is no agreement on sharing risks, causing delays or making project execution unfeasible.

## Current and Future Challenges

The social, economic, and political consequences of the investment in large infrastructure projects produce a situation where multiple actors – from inside and outside the government – work to influence the decision-making of the public policy. Consequently, investment allocation in this sector is fundamentally political, permeated by conflicting interests, bargains, and mutual concessions among the different actors at stake.

In Brazil, governance problems are deepened when it is considered the political-institutional environment that took place in the country after the democratization during the 1980s. The Federal Constitution of 1988, the most democratic one in the Brazilian history, established a multiparty presidential political regime in a federal system of government and a strong and autonomous horizontal accountability structure. In addition, the Constitution guaranteed the participation of civil society in public policies processes. Thus, Brazilian political-institutional environment is featured by various veto players and fragmented decision-making system.

The combination of presidentialism and multiparty system led to the construction of broad party coalitions (also known as *presidencialimo de coalizão*) to enable the approval of the Executive branch bills and projects, including the national budget. However, it can fragment the state administrative apparatus and put difficulties for governmental coordination because the management of the ministries and agencies responsible for infrastructure policy is distributed to politicians from different parties of the government coalition (Melo and Pereira 2017). In addition, the criteria for appointment to management positions of these agencies often implies the classic "politicians' dilemma," which it is marked by the need to choose between political support and technical qualification. One of the instruments that the Executive branch has to ensure the support of parliamentarians in approving the president's agenda is the release of budget amendments submitted by them individually. During the approval of the budget by Congress new investment projects are introduced, as well as changes in the allocation of resources provided for in the draft budget initially presented by the Executive. It makes difficult for the government to plan consistently and might represent a source of allocative

inefficiencies, since the resources for amendments may not be enough for project completion (Raiser et al. 2017). In the same way, the rules of the Brazilian political system result in an economic bias as electoral campaigns are expensive. In this context, infrastructure projects, featured by great investments and innumerable contracts, offer several opportunities for political campaign financing, encouraging the exchange of favors between politicians and private enterprises. In this situation, politicians tend to support projects that create markets for these private actors; in turn, these enterprises sponsor electoral campaigns (Machado et al. 2018).

With regard to federalism, local governments are important agents for implementing policies. For example, in the Growth Acceleration Program, 62% of the program financial resources were allocated to state and municipality implementation (Melo and Pereira 2017). Despite that, currently researches indicate that local governments were marginally involved in the decision-making process. Consequently, the sector's projects tended to be "territorially blind." According to Lotta and Favareto (2018), local governments were involved only in the implementation of the approved projects to solve problems that arose in that phase. Another issue is related to the problem of the asymmetrical technical-administrative capacity of the Brazilian municipalities for execution and monitoring of the investment allocated by the federal government. In this context, localities lacking state capacity are more likely to face problems to deliver infrastructure utilities.

Another consequence of the Brazilian political-institutional environment is the constant interference of the Public Prosecutor's Office in the implementation of large infrastructure projects, acting especially to claim environmental sustainability and the rights of vulnerable local communities. On the one hand, this can lead to paralysis in the decision-making processes, causing delays and budget overruns. On the other hand, these interventions can produce improvements in the project, in reconciling and inserting new interests.

Finally, concerning participatory institutions, the main channel of social participation in the infrastructure sector is public hearings during environmental licensing process (Abers 2018). However, this instrument has been criticized for being temporarily punctual, not considering the demands that should have been processed at the project design phase, and for its overly informative nature (Abers 2018). The absence of effective channels of participation of civil society in the decision-making process leads to political conflicts, once large infrastructure projects generate environmental and social negative impacts. As the decision-making process of infrastructure policy and investment allocation in Brazil is insulated from civil society, the Judiciary system becomes the *locus* for conflict resolution.

Concerning the private sector, the governance arrangements of PPPs are also prone to various types of conflicts of interest, which also require coordination between public and private actors, not to mention the need for transparency and involvement of stakeholders in the arrangements to be constituted.

## Conclusion

Infrastructure policy in Brazil faces many challenges. There is an infrastructure gap in the country, especially for transport and water and sanitation. Despite the efforts of governments in the last decades to boost investments, there is still a lot to be done. Brazil needs to improve the state policy capacity, especially for planning and governance to attract private capital to compensate reduced public investments. However, effects of additional investment might be timid if the governance of the policy process, such as project selection and coordination of multiple stakeholders, was not improved.

Nevertheless, infrastructure policy decision-making and implementation in Brazil are not only technical issues. There are several actors, with different interests, involved in governmental actions for this policy sector. The Brazilian political-institutional environment is featured by various veto players and fragmented decision-making network. If governance means the process in which a set of actors (state and non-state) are

related (formally and informally) in specific institutional environments in the policymaking, it emerges to the fore as a perspective to understand the problems of efficiency and legitimacy of infrastructure policy in the country.

# Innovation and the Public Workplace

Amelie C. Simons
Northern Arizona University, Flagstaff, AZ, USA

I

## Synonyms

Agency innovation; Creativity; Government innovation; New ideas; Organizational restructuring; Policy change; Policy innovation; Problem-solving; Public sector innovation; Technology adoption

## Definition

The creation of new approaches to both the development and implementation of public policy for the ultimate improvement of the quality, quantity, and availability of government services to the public.

## Introduction

The term "workplace innovation," when discussed in the context of the public sector, broadly refers to new approaches to the development and implementation of government policy. Innovation as a concept can be somewhat nebulous, as one could imagine that almost any new idea proposed within an office setting could be lumped under the umbrella of "innovation." However, public sector innovation is unique from the general term "innovation," as well as innovation in the private workplace, in that it has three crucial components:

First, in order to constitute innovation, new ideas from the public sector must truly be novel in their approach to a government agency practice or organizational structure. Secondly, innovation in the public sector must persist through the transition from the early policy development stage all the way through to the final implementation stage of the policy process. In other words, innovative ideas, while they might exist first in theory only, need to eventually be put into practice at the ground level – new ideas that are simply recorded on paper do not constitute public sector innovation until they are enacted through the policy implementation process. Finally, public sector innovations necessitate a long-term goal of providing benefit to society. In sum, innovations in the public sector workplace must fulfill three requirements: They must be novel, they must be implemented, and they must be based on the aim to materialize as a positive impact on the community (Daglio et al. 2015).

Traditionally, workplace innovation has been considered to be primarily the domain of the private sector (Verhulst 2016). Innovation in the private sector has long been an area of interest for researchers in both the academic and business spheres, as private workplaces are unencumbered by the adherence to procedure and accountability to the public of the government workplace. The private sector comprises the portion of the national economy that is not under the authority or control of the government, whereas institutions within the public sector are directly funded by, and thus directly accountable to, various branches of government. Innovation in the public sector also differs from the private sector in that it is not driven by profit or competitive advantage, but rather, as part providing services to the public, it retains the aforementioned goal of eventually delivering a positive impact to the community.

Due to the highly bureaucratic nature of public workplaces, especially in the United States, a misconception exists that innovation in the public sphere is stifled by adherence to procedure and thus is essentially nonexistent. This misconception gains credence from the incremental and piecemeal nature of public policy change, which suggests an overall lack of evolution and innovation in the public sector as a whole. However, while a lack of innovation may persist in a few isolated instances, evidence has increasingly demonstrated that innovation is an essential and common attribute of the public sector workplace. Contrary to popular belief, innovation can thrive in the public sector and is vital to the continued adaptation of government agencies to technological advancement as well as to continued improvement in the efficiency and effectiveness of public services. As such, innovation is crucial in order to maintain public approval of agency efforts (Verhulst 2016).

## Why Innovate?

In order to understand innovation in the public workplace, it is imperative to first examine some of the motivating factors that drive administrative innovation in the public sector. Public sector workplaces constantly search for new, better, and more efficient means of achieving governmental goals and implementing policy with public funds. While many public innovations have been inspired by the private sector, other innovations in the public workplace materialize as a necessity in response to rapid changes in technology. First and foremost, however, innovation in the public sphere is centered on a maximization of employee capacity, so that public service can be delivered to the community in the most efficient and effective means possible. Whether related to agency structure, organization, management, or roles, the maximization of human capacity is a key driver of public workplace innovation (Chi 2003).

Additionally, funding is one of the main stimuli of innovation, as most government agencies find themselves in a perpetual struggle between meeting the needs of the public while adhering to the confines of limited, and oftentimes diminishing budgets. As two of the financial motivations for public sector innovation are the ubiquitous goals of almost every government agency to find alternative funding and to stretch the budget in order to accomplish more with fewer resources (Chi 2011,

p. 1148). In the United States especially, government agencies at all levels are having to find a means of achieving lofty goals in the face of taxpayer reluctance to pay more. As such, innovative solutions in the public workplace have sought to find additional funding through collaboration with the private sector, as well as maximizing effectiveness and efficiency of the workplace with the preemptive expectation that the budget will either remain stagnant or decreased, as has been the case for many agencies in the wake of the 2008 financial crisis (Ibid).

Oftentimes, issues related to funding, technology, and the maximization of employee capacity are interconnected issues that are not isolated to one agency within the public sector. Rather, budget constraints, the implementation of new technology, and organizational reform are key areas of interest in almost all government agencies and thus constitute interdisciplinary problems that require innovative solutions. Furthermore, such innovation solutions often rest on cross-agency cooperation and sometimes even collaboration with the private sector (Daglio et al. 2015, p. 2). Agencies within the public sector do not exist in a vacuum (Ibid, p. 5), and the exploration of creative and cross-collaborative strategies and solutions is an essential means to develop innovative strategies to public sector problems.

## Types of Innovation

Innovation in the public sector workplace can take many forms, from the incorporation of new technology to cross-collaboration between the public and private sectors, all of which typically fall into one of two broad categories: policy or political innovation and program or management innovation (Chi 2003). While policy and political innovation works to improve the laws and policies themselves, management innovation seeks to improve implementation of that policy. Put simply, public sector innovation is either directed toward the improvement of policy or the improvement of policy implementation. Innovation related to policy development and reform tends to constitute broad, large-scale, macro innovative measures that seek to improve the efficiency and efficacy of the laws and policies themselves and typically require legislative measures in order to be enacted (Chi 2003, p. 1149). Legislators are typically the public sector employees involved in policy innovation, although the public and the media can also be instrumental actors that prompt policy development and reform. An example of policy innovation might be a restructuring of the court system (Chi 2003, p. 1148), or a redesigning of welfare policy to maximize a reduced annual budget. On the other hand, innovation in program and management structure does not concern the creation of innovative policy, as discussed above, but rather innovation in the strategies and methods for administering and implementing policy. While policy innovation tends to take place higher up in the government structure, like at the federal at state levels, innovation in policy implementation is typically more of a small agency and local-level phenomenon. The bulk of innovation in the public sector that involves administrators tends to fall into the implementation category and can materialize as organizational restructuring or the incorporation of new technology in the workplace (Chi 2003, p. 1149).

## Multilevel Innovation

Innovation in the workplace happens at all levels of government, from the national or federal level down to the local level. However, the type of innovation in question tends to depend on the level of government that the workplace is associated with. At the national or federal government level, innovation tends to fall into the first category discussed above and focus primarily on the *development and crafting of policy*. Innovation in the national government workplace is centered on the more theoretical creation of sound and substantive policy, whereby employees in the public sector strive to be innovative in their crafting of new policy or amending or restructuring existing policy. Innovation within the policy development realm is highly influenced by the political climate

of the time, yet still retains the altruistic goal of community betterment. However, at a city government office, for example, innovation consists primarily of the second type that is focused primarily on the betterment of policy *implementation* procedures. While local-level government agencies do significantly less in the way of crafting new policy than do state and federal agencies, local government plays a vital and arguably the most important role in putting into practice the policy measures crafted at the higher government offices. It is at the local level where innovation is imperative in the transformation of written policy into effective and impactful improvements for the community. The state-level innovation occurs at both stages: policy development and policy implementation. The state is responsible for the crafting of policy that is then enacted at the local level but also bears the burden of ensuring that policy coming from the national government is actually implemented within the state.

The concept of multilevel innovation within the public sector does not only refer to the various levels of government itself but also on the multilevel social structure that exists within the organism that makes up the public sector itself. This social structure can be thought of as a series of nested communities of actors, where society represents the largest sphere, followed by the public sector itself, then the various government agencies or offices, and finally the individual employees comprise the smallest sphere (Daglio et al. 2015, pp. 5–6). The notion of nested and increasingly smaller units of actors in the public sector is key for understanding and encouraging innovation, as innovation within the public sector, as mentioned above, does not exist in a vacuum (Daglio et al. 2015, p. 5). Rather, public sector innovation has a ripple effect that begins at the level of the individual government employees and outspreads to emerge as impacts at the society level. Just as lateral collaboration between the public and private sectors is a vital aspect in public sector innovation, so too is vertical collaboration across the different nested spheres, from the individual employee level to society at large. For example, individual employees will not be able to innovate if the larger government workplace is not open or friendly to new ideas (Ibid). Similarly, innovation from the public sector will not be realistic or impactful without feedback from society at large. Innovation is a collaborative effort that requires participation from all actors within the various groups that comprise the public sector.

## Strategies to Foster an Innovative Workplace

Following an examination of the starting points of public sector innovation is the question as to how to actually develop and support an innovative workplace environment? The creation of a workplace that inspires innovation is the primary step in the public innovation process. The physical and attitudinal tone of the government office itself can have a profound impact on workplace performance, as either a tool that supports innovation, efficiency, and effectiveness or an obstacle that inhibits creativity and prevents collaboration (Kaczmarczyk and Hunter 2006, pp. 1–3). As part of an increasing recognition of the importance of public sector innovation within the discipline of public administration, much research in recent years has focused pinpointing the means through which the public sector workplaces and employees can be empowered and inspired to innovate. The consensus thus far appears to be that both physical and attitudinal factors can have a profound impact on the level of public workplace innovation at any level of government office. Within the category of physical factors, spatial attractiveness and equity, a promotion of healthful space, comfortable and adaptable workspace, adequate communications technology, and overall technological reliability are central to the creation of a workplace that is physically conducive to innovation (Ibid, pp. 9–10). When it comes to attitudinal or atmospheric qualities that define an innovative workspace, it is imperative that the space lend itself to employee connectivity and a sense of community or place (Ibid). In practice, some of the measures that could be taken to improve and

encourage innovation in the government office include equal access among employees to windows and natural light, the inclusion of a communal recreational space, the installation of high-quality ventilation systems that promote the flow of fresh air through the space, and the implementation of flexible work strategies, all of which serve to foster a work environment that stimulates innovation (Ibid).

## Conclusion

Innovation in the public sector workplace is an immutable part of the policy process. In the past, innovation was considered to be strictly a private sector phenomenon that resulted from the inherent profit-focused competitiveness of the business world. However, as innovation research has gained increased attention within the study of public administration research, it has become clear this phenomenon is vital to the continued growth, efficiency, and adaptability of the public sector to the needs of the community it serves, especially when government agencies are faced with a decreased availability of funding. The private sector, in fact, has inspired many innovations within the public sector, especially when it comes to a maximization of workplace efficiency and effectiveness, the use of new technology, and in ideas to overcome the often inherent incrementalism and stagnation of a bureaucratic system of government. Public sector innovation drives both policy development and policy implementation. Innovation in the public sector occurs not only in the development of new ideas but also the implementation of those ideas in order to better provide the public with government services. Innovation exists at all levels of government and in all institutions that make up the public sector. Despite the essential nature of public sector innovation, the government workspace is not always a nurturing environment for dynamism and creativity; thus, there has been a burgeoning focus among researchers on the study of public workplace innovation. This is a niche discipline of public administration analyzing both the physical and atmospheric traits of the innovative workplace, as well as the development of strategies to encourage innovation within the public sphere. As innovation continues to gain relevance within the field of public administration, as well as within organizational and management theory, the hope is that increased innovation will ultimately lead to more efficient and effective service to the community.

# Innovation and Tradition in Public Administration Reform

*Reform in Public Administration*

Richard F. Callahan
School of Management, University of San Francisco, San Francisco, CA, USA

## Synonyms

Innovation; Reform

## Introduction

In the reform movements generally in public administration and in reform initiatives by individual public administrators, there is an ongoing tension between innovation and tradition. This tension has been long-standing, dating back to the formation of public administration as a field of practice and of study. In the United States as public administration developed as a profession and developed interdisciplinary research distinct from political science particularly in the 1930s, reform of existing organizations and management practices became an ongoing theme. Within the questions of reform, two sets of issues developed: innovation, that is, change with a preference for new ways of practice, and tradition, that is, continuity with a preference for current practices.

Over the past 80 years, what emerges in public administration is a continued interplay between advocates for change and advocates for tradition. This tension is often resolved with innovations becoming accepted and then being the traditional practices. A repeating and evolving cycle develops of innovation becoming tradition. For example, the Social Security Act, as proposed by the president of the United States, Franklin D. Roosevelt, was perceived in 1935 as radical innovation with significant questions of providing a minimum level of income for the elderly and widows. Within a few decades, the innovation become a model for future innovations at the national level with the introduction of Medicare and Medicaid in 1965 for health insurance for the elderly and impoverished youth. By the early 1980s, Social Security became an unassailable tradition in the United States, questioned at considerable electoral peril (Neustadt and May 1986). More recently, the tension between innovation and tradition can be seen in the UK's Brexit vote: the choice between engagement in an innovative institutional design, the European Union in contrast to a tradition of national sovereignty.

The concept of reform in public administration cuts across a wide range of the research and practice. Necessarily, focus on one part of reform runs the risks of not recognizing other aspects. To develop a comprehensive, but not exhaustive overview of the interaction between innovation and tradition in public administration reform, five themes are explored to organize the review. These themes provide a method to systematically explore key aspects that have emerged and surface enduring issues across a range of reform efforts. This overview of innovation and tradition in administrative reform develops five themes:

1. Public administration is best conceptualized as a reform movement committed to innovation.
2. Tradition can be seen as a commitment to rule of law and constitutional law.
3. Reform includes organizational, community, and institutional layers.
4. Reform involves more than the delivery services.
5. In representative governance oversight by elected officials impacts innovation.

## Public Administration as a Reform Movement

Despite a name that sounds locked in tradition, in many ways public administration as field of practice can be seen as a reform movement, closely aligned with good government practices and values of the Progressive movement of governmental reform in the United States. Reform is central to most discussions of public

administration (see, e.g., Guy and Rubin 2015). Typically, the engagement in reform starts with the question of: How can we do better? This question is asked across a wide range of processes or outcomes, including but not limited to public management, citizen engagement, cost-effectiveness, social equity, ethics, data-driven decision-making, or many other topics. Conversely, the question is rarely asked of how to preserve the status quo. The pressures from elected officials wanting to show accomplishments and careerists wanting to demonstrate their skills, or from budgetary or societal or community pressures, there is a push for consistently looking at reform. Innovation in the delivery of public services can be seen as one of the persistent qualities of public sector professionals (Borins 2014).

Innovation in public administration has been linked to the idea of creating public value (Moore 1995). This linkage expresses a belief that in public administration, innovation is not simply a change, but that innovation involves change that benefits the public. This benefit can be found within the organization, or in the community, or in policy change, or institutional change. But inherent to the concept of public administration is the connection to public, to the public good, and to innovation as a means to creating value that advances the values of the public.

This pressure for reform is not limited to one nation or set of nations, rather continues globally in both the practice and research of public administration. Most recently, the widespread adaption of innovation described in New Public Management continues to illustrate that where there is innovation, there is concern with tradition (Hood 1991). This is not to say that tradition in public administration is in opposition to all innovation. Rather, the challenge of innovation in the public sector is reconciling change with the lessons learned and societal values represented by tradition in public administration. Innovation in practical terms is seen as having significant impact on a public organization or public policy, with the change as positively engaging those affected, transparent to both those inside and outside the change, and with an accountable and sustainable implementation.

A pressure for reform often comes from the electorate or communities. The practice of civic engagement is closely tied over the past 20 years to the practices of creating value. Innovation occurs at the community level in creating public value by working with both public agencies and the nonprofit sector. The research into creating public value has developed to include both the public sector and the nonprofit sectors. Reform in public administration is not limited to government agencies, but rather the drive for innovation over the past 30 years regularly involves design of programs that can draw on both public agency funding and nonprofit sector service delivery.

Described as inter-sectoral or cross-sectoral collaborations, these reform efforts look for innovation driven by working across the public sector and nonprofit sector, as well as occasionally the private sector. The driver for this approach to reform is both a recognition that while the public sector provides funding, it does not have to provide all services funded. A second driver for this type of innovation is a candid assessment that the complexities of the contemporary problems defy easy solutions or one-dimensional approaches. Rather, there is the complexity of seemingly intractable problems and need to generate new intellectual capital, new ways of thinking, and need for a range of partners from each sector, each with a distinct set of assets – not just vertical approaches within government agencies, but horizontal approaches across sectors (Kettl 2006). The tension emerges then between tradition and innovation.

A traditional approach had been public organizations delivering all services. An innovative approach not only allowed but also encouraged a range of nonprofit organization to design, develop, and deliver services. The emergence of contracts for public services, previously exclusively provided for by a public organization, moves from tradition to the potential for innovation. At the core of the innovation is the emergence of a range of providers, connected through contracts as a network in providing services. The landmark research by Provan and Milward (1995) uncovers networks in community mental health as an effective innovation providing

services formerly provided by public agencies. Subsequent research has found that much of the work of public managers can often be managing the contracts and networks of nonprofit providers.

In contemporary public administration, network management has been described as the shift from public administration occurring strictly in government to public administration as concerned with governance, overseeing funding and programs both in and outside of government agencies. Networks have emerged as a dominant theme and significant responsibility of the public manager. Varied forms of collaborations with public and nonprofit sector agencies allow innovations to emerge in a wide range of services that create public value in public safety, social services, public health, infrastructure, park preservation, low-income housing development, and other services (de Lancer Julnes and Gibson 2016). The prevalence of nonprofit networks advancing public sector goals with public sector funding provides evidence that what once was an innovation in public administration has transitioned from reform to tradition.

Yet tradition in public administration is more than a practice that has become prevalent or widely shared. Public administration tradition does not simply develop from collecting successful innovations that stand the test of time. Rather, public administration tradition draws on concepts that are not tied to transitory values or program practice. The strength of public administration tradition is not the embrace of management or popular fads. The source of tradition in public administration is developed in the next section.

## Rule of Law

Fundamental to tradition in public administration are two concepts: rule of law and human dignity (Newland 2012). The first is the concept of all people under law. Or as developed in the political theory, the concept of the king under law – and therefore everyone – subject to the same laws. The debates in public administration between different courses of actions are always in the context that there is a search for the meaning and intent of the law. That tradition in public administration is of decision-making guided by and constrained by the rules, the regulations, and the laws. This tradition is in contrast to arbitrary rule making or decision-making based on the wishes of an individual in a position of power. Drawing on the fundamental concept of bureaucracy in contemporary society as a set of rules followed by those in the organization, public administration draws on a tradition of constitutionalism that embodies societal rules, creates institutions, facilities organizations, and structures the actions between those in power in administrative roles and the public those administrators serve.

Public administration is distinguished from simply administration of organizations by the connection to the public. The tradition of public administration is of rule of law and the exercise of state power constrained by those rules. Central to public administration is recognition of a tradition of civil institutions that protect civil life. Moreover, these institutions that public administration tradition create various path dependencies that in turn support following these traditions. Effective institutions improve the operation of public organization for societal benefits. Designing effective institutions that create value in the places people live are central to the role of public administrators properly understood (Kirlin 1996). Well accepted is the idea that for economic success, institutions such as property rights and support of those institutions facilitate economic growth and prosperity, as found in the Nobel Prize-winning work of Douglass North (1990).

The critique of permitting too much administrative discretion derives from a fundamental commitment to the tradition that the roles of public administrators need to be carefully delineated by rule of law. Too much discretionary authority runs the risk of arbitrary decision-making where the public administrators are above the rule of law. This concern drives the critique of the New Public Management (NPM). The concern expressed in various forms with the NPM finds that the pursuit of innovations for increased effectiveness provides too much administrative latitude to initiate actions based on their judgments as public managers, rather than their roles as stewards of rule of

law (see, e.g., Hood 1991 or Radin 2006). At the core of this caution is the traditional belief that the power of governments can be so vast, so extensive that only constitutions and laws protect the public from the misuse of the power of the state. The core tension is between assigning the state sufficient coercive power to complete needed tasks, such as public safety, infrastructure building, and social and health services, while at the same time not providing so much power that public administrators can arbitrarily make decision that affect or harm the public.

The second significant concept embodied in public administration tradition is the value of human dignity. A focus on human dignity as the core of public administration tradition is extensively developed by longtime researcher and writer in public administration, as well as former director of the US Federal Executive Institute, Chester Newland (2012). The recognition of human dignity provides a set of values that can guide public administrators through adhering to a tradition. The centrality of administrative ethics in public administration can be seen as a commitment to the human dignity of each person affected by administrative decision-making. The early discussion and focus in public administration starts with a Progressive Era commitment to effective and corruption-free operations of public service. The innovation begins with subsequent research that looks at individual decision-making as the unit of analysis, confronting the question of administrative malfeasance, of corruption, and personal benefit at the expense of the public good. The traditional emphasis on reducing corruption shifts from the organizational level with corruption to a focus on the importance of ethics and individuals in decision-making.

The sixth edition of Terry Cooper's book *The Responsible Administrator*, originally published in the early 1980s, reflects a shift from innovation in thinking about the practice of ethics to an accepted tradition in public administration for ethics behavior, guided by thoughtful and reflective decision-making that explicitly draws on ethical frameworks. In addition, Cooper (2012) couples responsible administration with the expectation of administrative decision-making that includes structures for community participation. This inclusion of community engagement stems from a commitment to the dignity of each person. The tradition of the public administrator as the decision-maker focused on effective government has shifted to an innovative approach of the public administrator responsible for structuring processes of ethical decision-making that includes community input. In this way, tradition and reform are reconciled around the adherence to a value in human dignity.

In the above discussion of rule of law and human dignity, the idea that tradition in public administration is advanced by institutions, organizations, and individuals previews the next feature of innovation and tradition. The reality of reform in public administration reflects the complex nature of the field as serving in society at different levels.

## Levels of Reform

A useful set of distinctions surface the varied settings for innovation and tradition. Considering societal action as occurring in five different dimensions provides a backdrop for placing innovation and tradition in public administration. These five levels are individual, groups, organizations, and institutions and society (Callahan 2001). Metaphorically, the map of reform in public administration covers the terrain at each of these levels. Public administrators do not navigate on a map that is flat, absent topological elevations. The tension between of innovation and tradition occurs across much of the landscape.

The inherent complexity of public sector problems defy study from only one discipline focused on only one layer of society. Political science provides strong research on elections, but not on organizations. Sociology provides great insights on communities, but not on politics. As a result, public administration research draws on a wide range of academic disciplines with varied tools, research methods, and different units of analysis, best described as an interdisciplinary approach to research and practice (Raadschelders 2011).

The reform emerges at each of these layers of society, with the most difficult of challenges calling for generating new policies, new structures, and new ways of aligning performance with values. In this context of challenges and problems, innovation in public administration increasingly calls for interdisciplinary approaches A set of challenges generally described as wicked problems often cross jurisdictional boundaries and levels of government, such as emergency response or environmental protection, have high consequences for failure, and call for urgent solutions (Kettl 2006).

Traditionally the work of public administration was seen as focusing on public organization that occurs regularly. The initial research in public administration focused on public organizations, considering questions on how best to structure the organization. The organizational chart became a dominant way of understanding the organizational interactions, goals, functions, and outputs. Innovation was seen as driven by reorganizing the arrangement of units within the organization, changing the reporting relationships, varying the amount of centralized oversight or the amount of decision-making discretion through decentralization.

The tension between tradition, the past way of organizing a public agency or assigning responsibilities to a public agency, and innovation as changing the structure of an organization remains a contemporary feature. The focus on organizational structure as a way of reform can be seen in a range of examples. A visible example in the United States with innovation being the reorganization of the structure of reporting relationship through the creation of the US Department of Homeland Security in 2002 that centralized units previously located at several different departments. But innovation does not always move in the direction of centralization. An innovation through reorganization that focused on decentralization occurred at the US Department of Veterans Affairs in the late 1990s. Under the direction of then undersecretary, Dr. Kenneth W. Kizer, MD, decision shifted from Washington, D.C., to decentralized decision-making in each region of the nation in regionally vertically integrated networks of medical care.

But reform in public administration is not limited to the organizational layer. Within the context of public sector organizations, the tension between tradition and innovation also occurs at the individual level. The focus on what motivates an individual in public service emerges as an important consideration with research framed as Public Service Motivation (PSM) (Perry and Wise 1991). An important focus on how innovation can increase individual motivation with the effect of increasing the performance of public agencies has been a consistent theme in federal reform efforts (Light 1997).

As second example of public administration reform at the individual level is found in the development of the system of civil service, civil service can be seen as offering individuals in public organizations specified protections, such as tenure in office or procedures of appeal of disciplinary action, for their exercise of professional standards. However, civil service – once viewed as a significant innovation – is now seen as a tradition with innovations over the past decades in the movement described as New Public Management (NPM) or Reinventing Government pushing to modify civil service hiring practices. These contemporary reform movements de-emphasized the job protections of civil services advocating innovations such as giving public managers increased flexibility in hiring and firing through revising civil service. Once again, what was once seen as innovative and progressive, civil service, in local, state, and national government, has become seen as tradition.

As well as institutions for professional conduct, voluntary membership in professional associations, such as the American Society of Public Administration (ASPA) and the International City/County Managers Association (ICMA) are institutions designed to self-regulate the profession, for example, sanctioning city managers engaged in partisan politics. The net effect of associations of public sector managers and executives develops a set of institutional expectations to preserve traditions, as well set guideline, particularly with ethics on the parameters of management actions for introducing innovations. In many ways, these professional associations become

institutions as stewards of tradition, with rules designed to provide predictability in the range of activities of public administration, including but not limited to hiring, civil service protection, expectations for performance, legal protections, and a range of other activities of public servants.

In addition to the individual, organizational, and institutional levels, an increasing amount of public administration innovation occurs in the community level. The engagement with community emerges as an important theme in public administration with the research that starts in the 1970s on the discretionary decision-making at the front lines of working with citizens. This work extends through the concept of the importance of civic engagement in the work of the public sector. Rather than relying on election results annually, of every 2 or 4 years to set direction by the public, the concept of civic engagement develops an expectation that public administrators design processes to engage those most directly impacted by the decision-makers. One conceptualization of this approach is the expectation of getting closest to the people who are closest to the problem, whether they are inside or outside of the bureaucracy.

## More than the Delivery of Services

For the wide range of innovations, the tradition in public administration makes a forceful argument that public administration is about more than service delivery. At the least public administration innovation needs to align with tradition at the organizational and institutional levels (Callahan 2001). Moreover, the tradition in public administration finds that democratic values (Radin 2006) more than performance management and more than efforts to improve organizational efficiency should guide public administration reform.

Typically, innovation can focus on improving new types of programs or improved service delivery in public administration. Examples of innovations abound in capital project constructions with new subway projects in London and Paris serving not only as traditional transit improvements but also as innovative catalysts for economic development and, particularly in the case of Paris, as connections between different layers of society. Innovations can be seen in the development of entire new national agencies to address newly emerging issues, such as with the creation of the US Department of Environmental Protection in 1971. Innovation can also be seen in aggregating separate and often competing nations, such as with the development of the European Union. Similarly, innovation can be found in creating a new agency to address geographically shared problems across disparate local governments, such as the creation on the Los Angeles Basin of the South Coast Air Quality Management District in recognition that air pollution does not stop at political boundaries.

Beyond the creation of new projects and agencies, innovations can occur in the delivery of services, for example, the reorganization of the second largest healthcare system in the world, the US Veterans Health Administration moving from hospital-centered care to patient-centered services in the late 1990s. Other service delivery innovations can be seen in the emergence of public health programs for reducing lead paint exposure in children or Denmark's implementation of sophisticated metrics for assessing the performance of public education. Innovation in service delivery can be seen in transit systems moving to electronic fare collection as opposed to cumber some manual pay exchanges. Often innovation can be driven by the emergence of new needs or crisis, such as the innovations in water management and delivery in Australia due to extended drought.

A critique on innovation described as the New Public Management focused on performance management measures develops from the perspective that government programs are about more than measuring levels of performance (Radin 2006; Kirlin 1996). Globally, the question of legitimacy in government develops from more than the delivery of services. Tradition argues that the values for innovation in service delivery matter more than simply the delivery of services. The long-standing difficulty of effective program evaluation suggests a tension between traditional adherence to the values of public administration

and the difficulty of innovation in measuring outcomes aligned with values.

## Dynamics of Representative Government

Reform and tradition in public administration typically occurs in the context of constitutional democracy. Fundamental to public administration in the context of constitutional democracy is the central role of elected officials in both the legislative and executive roles. In one sense, public administrators can be considered elected officials, particularly in executive roles, such as a state governor or national president or prime minister. More typically, the role of public administrators is seen as those who are appointed and those who are career administrators but not in elected roles. The tensions between innovation and tradition occur in the context of public administrators interacting with elected officials.

The interaction of elected officials and public administrators creates the opportunities for tradition or reform to affect public organizations and institutions. Central to this relationship are two issues. First, the tension between public administrators acting in tightly prescribed roles with limited discretion or as more autonomous professionals, expected to exercise discretion. Second, central to this relationship is the role of trust in both directions: from the top down how much elected officials trust public administrators and from the bottom up, how much do public administrators trust those in elected oversight positions.

This relationship between elected officials and public administrators creates a dynamic tension in reform and tradition. The relationship is not linear as only administrators advocating for tradition or newly elected officials always as innovators. Rather, comprehensive research has found consistent dynamics that limit elected officials pushing for reform, as being limited by the need to trade reform for specific policy goals, the difficulty of sustaining trust, and the challenge of focusing on reform with the many demands for the attention of elected officials. Conversely, career officials may initiate innovation, as well as be the repository of tradition. The reinventing government movement of the 1990s can be seen as innovations in public administration with the focus on public managers, advocating for more discretion, initiative, and rewards for career officials. In the western European and Commonwealth as well as North and South American democracies, this reform emphasis became a known New Public Management. The innovations included development of extensive performance management systems and measures to increase accountability for outcomes, as well as an expectation that public managers would be at the forefront of innovations.

The complex interaction between elected officials and career officials can lead to periodic shifts in reform. The tension can be described as innovation pushing forward and tradition urging caution. This tension can be anticipated to the extent that the result is predictable cycles or as described by a longtime research, as occurring with the regularity of the ocean tides, or in public administration the "tides of reform" (Light 1997). The interactions on innovation and tradition with elected and appointed officials can often involve one the five tensions:

- Centralized versus decentralized decision-making: how authority is assigned.
- Reliance on people versus structure: the role of professional judgment and motivation.
- Elected official oversight: the role of trust and timing.
- Risk identification, mitigation, and management: the level of risk aversion.
- Insulation from future reform: the difficulty of future changes.

Also, in national systems that delegate a range of state powers, the dynamic interplay of elected officials and career public administrators occurs in an intergovernmental system, with complex interactions between elected officials from local, regional, and state or provincial entities in tension with national elected and appointed officials. The direction of reform in public administration is both horizontal, across similarly situated administrators and elected officials, as well as vertical between national and local officials. As a result,

forces for innovation and for tradition can come from many directions, bottom up or top down, as well as from peers.

## Conclusion: The Future of Innovation and Tradition in Public Administration Reform

Conceptualizing public administration as a field characterized by reform facilitates understanding innovation and tradition as in an ongoing tension in the practice and research of reform movements. A review of the history of the field of public administration suggests five ongoing concepts that describe past and contemporary reform efforts and the interaction of tradition and innovation.

First, reform is an ongoing feature of public administration, with the driving forces for reform in public administration always present. Public administration scholar, Alasdair Roberts (2014), describes these pressures for reform as the "large forces" of society, such as economic downturns, industrialization, or war. These large forces in society shape public administration and the development of administrative theory and practice. Public administration understood in the fullest sense of the research and practice of the field can be seen as regularly engaged in the tension between innovation and tradition in addressing these large forces.

Second, in a paradoxical manner, the tradition of public administration can be seen as embracing innovation. While tradition can be often be characterized as arguments for the status quo, the reform tradition in public administration calls for a connectedness to the values and goals of public administration as committed to change but within the context of those founding values. So the tradition in public administration does not question innovation simply as innovation, but to question how the innovation advances the values of public administration in constitutional governance.

Third, there is a consistent pattern in public administration reform, that a specific innovation initially viewed as in tension with tradition over time becomes part of the tradition of the work of public administrators. This embrace of innovation is consistent with public administration as a reform movement. And that innovation which becomes mainstream in public administration reflects the second concepts of connectedness to values.

Fourth, an essential feature of reform in public administration is the interaction between elected officials and appointed public administrators. Innovation and tradition occur in the context of multiple participants, which include elected, appointed, and career officials, as well as various stakeholders. The directions of forces for innovation can be horizontal and vertical, in an environment best characterized as dynamic and fluid, as opposed to static and predictable.

In conclusion, reform in public administration with the tension between tradition and innovation reflects the dynamics of the society at the individual, organizational, and institutional levels. A fundamental driver for tradition in evaluating innovation is rule of law and a commitment to public administration as being more than simply the delivery of public services. The dynamics of representative government drive both tradition and innovation. The tensions between tradition and innovation continue even as what was once seen as innovative becomes accepted as part of the public administration tradition.

# Innovation and Tradition in Public Administration Reform: Case of Russian Central Governmental Budgeting

Konstantin Timoshenko and Igor Khodachek
Nord University Business School, Bodø, Norway

## Synonyms

Change; General government sector; Legacy; Modernization; Path dependency; Sediment; Transformation

## Definition

Innovation is something new or different introduced that signals a break with the past. Tradition refers to a long-established or taken-for-granted way of doing things.

## Introduction

Assiduous endeavors have been made to reinvent the public sector worldwide under the banner of New Public Management (NPM) over approximately the past four decades. NPM has by now circled the globe by diverse paths and landed in varied contexts. While OECD nations first embarked on their publicly charted course toward NPM, questions of how to streamline the public sector were then put on top of the agenda in many less-developed settings. The outset of a new millennium witnessed the Russian state joining the crusade. A policy toolkit included the introduction and implementation of performance-oriented budgeting and medium-term financial planning, as well as the transformation of Russian public accounts toward accruals. However, as some researchers have elucidated, these seemingly NPM-like arrangements did not serve for enhancing instrumentality, but rather for supporting the image of the Russian state as a "modern" and "progressive" player in the international arena (Timoshenko and Adhikari 2009). This is well in line with the literature and empirical researches on the public sector worldwide, envisaging NPM-like reforms more in terms of fashionable and popular line of thought, rather than a full-fledged device calibrated to solve all public administration problems.

While NPM was the dominant theme in the 1990s and early twenty-first century, the 2010s are far from the best of times for NPM. With the downfall of NPM that we have witnessed in recent years, public administration worldwide is clearly moving in new [post-NPM] directions. New (old) paradigms or public sector reform discourses, as varied as Public Administration, New Public Governance, and the Neo-Weberian State, have come into play, threatening to challenge the ideological leadership of NPM in the field of public sector reforms and even to dismiss or supersede it. All that could not but affect the way Russian public sector reforms have been framed.

This entry examines which paradigms or public sector reform discourses have prevailed in the Russian public sector over time and how these discourses have been reflected in Russian central

governmental budgeting. In so doing, the entry focuses on the appearance of a nascent budgetary framework at macro-level, commencing from the outset of the new century and continuing until recently. As a result, the development of Russian governmental budgeting was assembled into three successive periods. Their choice was due to the identified patterns of continuity and change in the content of central government budgetary provisions.

The remainder of the entry proceeds as follows. The first part offers an overview of public sector reform paradigms that have recently emerged. The second part provides a contextual understanding of broader public sector reforms in Russia and recent alterations in Russian governmental budgeting that were brought about by the federal government. In the third part, the evolution of Russian central governmental budgeting is described, originating from the beginning of the new century until recently. The fourth part concludes the entry, summarizing its key points.

## Is NPM Still Alive?

Along with numerous accomplishments, NPM has received significant criticism from the academic and professional communities. For example, more than two decades ago, Brunsson and Olsen (1993) documented that, generally, this criticism occurred because public sector reforms rarely proceed as expected, or intended by the policymakers that designed the reforms. Notably, the existing patterns of successful implementation of public sector reforms are often advocated by authors that are closely affiliated with international financial institutions such as the International Monetary Fund, the World Bank, and the Organization for Economic Cooperation and Development. Concurrently, academic researchers have unveiled a huge gap between the ideal reform concepts and the application of new financial instruments.

The results of prior studies regarding NPM are somewhat contradictory and riddled with controversies; a growing number of empirical studies clearly speak against it. These studies provide more evidence of endeavors to modernize the public sector landscape worldwide rather than to achieve desired outcomes. In their recent studies of a 30-year period of public management makeovers in the UK, Hood and Dixon (2016) documented the failure of reforms to reduce government costs and improve its ability to serve the citizenry. However, despite the above criticism of NPM and its documented merits, there is a consensus in the literature that NPM is still alive and very much kicking, and will continually stay attractive to policymakers, at least in the foreseeable future, and challenge public sector managers even as it faces resistance and opposition from the profession.

Recent studies regarding NPM may be channeled into two streams. One stream strengthens the trend of government reduction while focusing broadly on interorganizational settings. This is what has become known as New Public Governance (NPG) (Osborne 2010). The other stream has proposed a model that partially reinvents the merits of a historical ancestor of NPM – Public Administration (PA). This is often referred to as the Neo-Weberian State (NWS). Furthermore, Pollitt and Bouckaert (2011) affirm the existence of three recently emerged models of public sector reforms: NPM, the NWS, and NPG. Conversely, Drechsler (2013) offers a different perspective and presents a contextual paradigm of governance and administration: Chinese, Western, and Islamic traditions of governance. The homogeneity of these traditions is widely questioned. Pollitt and Bouckaert (2011) suggest that the Anglo-Saxon and the Continental European traditions differ, and Pollitt (2009) declares that the Russian or Soviet tradition is a standalone case and claims that post-Soviet Eastern European countries share many common features with the Russian model. In the Russian case, which is apparently similar to numerous post-Communist contexts, the ideas of NPM were apparently not based on the business practices, but rather were imported by the supranational financial institutions (Timoshenko and Adhikari 2009, 2010). However, unlike numerous developing economies, Russia inherited its accounting tradition (Bourmistrov 2001) and the legacy of a

sophisticated administrative planning system that was used to govern the state, the public sector, and the so-called *socialist enterprises* in the Soviet Union.

## The Russian Setting

Throughout the history, the Russian Empire, the Soviet Union, and later, the Russian Federation have represented an example of a society that modernizes itself through rapid changes that affect the social sphere and is affected by leading ideologies. The role of the state in regard to the production of public goods and commodities has changed, although it has remained remarkably significant. After the demise of the Soviet Union in 1991, Russia experienced turbulence as it worked to become a full-fledged market economy and democracy. Russia made important strides toward establishing a robust private sector under Yeltsin's reign, but the development of the government sector appeared to lag far behind. Since President Putin came to the Kremlin in 2000, questions regarding how to modernize Russian public administration came to the forefront and heralded the launch of a more or less comprehensive policy pattern. During Putin's first 4-year term in office, he was determined to build *a strong state* and use it to solve all Russia's problems; this is evident in his statement: "For Russians, a strong state is not an anomaly. . . Quite the contrary, [Russians] see it as a source and guarantor of order. . . and the main driving force of any change."

Since 2000, the Russian state has significantly strengthened its presence in the national economy. This process included two dimensions: boosting budget investments into the consolidation and growth of state-owned companies and state corporations as well as de-privatizing key assets in the oil and gas sector by implementing various, and occasionally, highly controversial strategies. In 2012, state-owned enterprises produced approximately 50 percent of the Russian GDP (OECD 2013). Because of an increase in oil prices and steady GDP growth, Russia's public sector received better financial support when compared to the 1990s.

Since Putin's re-election in 2004, reform energies intensified with rapid velocity. In this context, appeals for boosting efficiency, effectiveness, and accountability began to be widely heard in the country, serving as truths, in the name of which, the Russian state was to be revitalized. The policy package included but was not limited to the Budget Process Reform, the Administrative Reform, and the Restructuring of the Public Network. Boosting accountability and widening managerial autonomy in the Russian general government sector were at the forefront of these reform efforts. The goal of the Budget Process Reform was to ensure the effective allocation and management of government finances for meeting the country's policy priorities and objectives. The policies were diverse and included the launch and implementation of performance-oriented budgeting, managers' responsibility, medium-term financial planning, as well as the transformation of Russian public accounts towards accrual accounting.

The need to reform the budget process was deemed extremely important, especially if viewed in the context of the on-going administrative and other reforms of all federal relations and self-government. This included an ambitious plan for streamlining budget institutions, and a change in their nature. A radically improved structure of the federal government was endorsed with the passage of Presidential Edict # 314 "On the System and Structure of Federal Organs of Executive Power" on March 9th, 2004. The initiative was intended to "tackle issues such as the different types of government bodies, their respective roles, and the overarching accountability/subordination framework" (Parison and Evans 2004, p. 7). In addition to the Budget Process Reform, Diamond (2005, p. 4) referred to this initiative as "a most ambitious attempt to fundamentally restructure of the Russian federal government apparatus."

Zherebtsov (2014) claimed that the public administration reform, which was based on NPM ideology, contradicted the nature of the political process that was established during the presidency of Vladimir Putin and referred to as the *vertical of power*. He argues that this reform "has not yet resulted in significant improvements in the

governance of the country" (Zherebtsov 2014, p. ii). "The conceptual inconsistency between the reform's ideological background, on the one hand, and the mainstream political process that is based on the doctrine of the 'power vertical'" were claimed as the primary reasons for reforms' failures (Zherebtsov 2014, p. 436).

Evidence of moving away from Western-type of liberal paradigms in state governance included the passage of a new federal law on strategic planning in Russia in June 2014. The policy-makers who were involved in the drafting of the law nicknamed this legislation "the network-based Gosplan 2.0" referring to the Russian acronym for the agency in charge of the central economic planning in the USSR – Gosplan. According to this law, strategic planning is to be introduced into the work of federal and regional authorities, and into the activities of public sector enterprises and state-owned companies. After the full adoption of this law, the federation, all regions and the so-called "macro-regions" (e.g., Russian Arctic zone, Siberia, and the Far East and federal districts), all industries and state-owned enterprises are expected to adopt mid-term (6 years) and long-term (12 years) forecasts, strategies and detailed plans for their implementation.

## The Evolution of Russian Central Governmental Budgeting

Although the ongoing budgeting reforms in Russia were implemented top-down, they replicated certain features of NPM. In the Russian context, it is generally perceived to align with recent international trends and best practices that are commonly found in OECD countries. As documented by Timoshenko and Adhikari (2009), the transformation process in Russia was substantially affected by overseas forces through large international organizations such as the IMF, the WB, and the International Public Sector Accounting Standards Board (IPSASB) that question the prevailing budgeting and accounting systems, dispense advice on how to alter them, and ensure financial support. In addition to the evidence of NPM, there is the existence of a sequencing approach or a systematic chain of "should do" and "must do" changes that are promoted by authors or publications who are close to the IMF or other international financial institutions (Bietenhader and Bergmann 2010). The formation and reformation of systems of provisions that regulate governmental budgeting in Russia can be clearly separated into three stages. These stages are delineated by clear patterns of continuity and change in the central government budgetary norms.

The first stage, *management of expenditures*, began with the establishment of the Russian state in 1991 and continued until 2004. This stage included the creation of the Federal Treasury and the launch of cash-based budgetary accounting. The dominant institutional pressure was coercive isomorphism, primarily from the IMF and the WB. In addition, PA logic served as the prevalent prototype that guided the changes during this period. The second stage, the *transitional* period, began in 2004 and proceeded until 2008. This stage was characterized by a clear-cut reference to NPM-like rhetoric, which distanced the Russian state from the legacy of the Soviet past and moved toward the adoption of budgetary rules and provisions that are commonly found in the West. Appeals for greater efficiency, effectiveness, accrual accounting and performance management were widely heard in the country during this period. The normative isomorphism of the IMF and the WB replaced coercive pressures by eliminating the dependency on their funds and continued close coordination with the Russian Ministry of Finance.

Since 2008, the state of Russia has embarked on a new ongoing wave of budgetary reforms that is commonly referred to as *management of outcomes*. Performance measurement and performance management, programs, mid-term plans, and strategic planning have all been introduced during the third period. This is indeed the most complex and controversial stage because of a marked interplay of elements that stem from NPM, NPG, and even the NWS. The normative influence of supranational institutions remains considerable and penetrates academic education and research. Although large-scale anti-Western

rhetoric and the demonized image of the West dominate Russia's political realm, the country's political elite rely on a comprehensive package of Western public sector methodologies while promoting the positive image of the Russian state in the international arena.

## Conclusion

Although the Russian setting is distinct from that of OECD countries, the similar processes of hybridization and "nationalization" of NPM-like arrangements are apparent. Along with the NPM trend, the nascent system of governmental budgeting is a result of other public sector reform discourses and certain ideas that were inherited from the Soviet past and the strong ideological rhetoric of Russia's political elite, aimed to boost the image of the Russian state as a modern and progressive player in the international arena. Russia's budgetary framework possesses inherent features that are pertinent to each paradigm. These features include, but are not limited to, NPM-like performance measurement and performance management, a strong reliance on legislation that is more reminiscent of PA tradition than NPM, and elements of NPG and the NWS such as consolidated budgets and reports, participatory budgeting and the role of the state as the primary provider of welfare. Therefore, it is very likely that all the four public sector discourses have acted in concert to transform Russia's budgetary framework, with the power and potency of each paradigm varying over time, given the particular set of actors and circumstances in place.

Notably, it is beyond the authors' comprehension to name any of those four as the prevailing or dominant ideology behind the transformation process in contemporary Russia. First, one of the most visible features of the last decade or so in the nation has been the growing centralization of power, so it is not a pure NPM model that underlies the ongoing changes. Next, the mobilization of core democratic mechanisms has been merely ceremonial, implying that it is not PA, which subsequently rules out the NWS, as claimed by Pollitt (2009). Furthermore, it is not NPG because of a clear-cut focus on hierarchy and vertical subordination rather than coordination and governance. Lastly, assiduous endeavors to reinvent the Soviet legacy through the adoption of a new federal law on strategic planning were recently documented.

The case of the Russian state is telling. Various ideas influence the official agenda and many different drivers affect the decision making. Both practitioners and researchers are aware of these controversies and inconsistencies. Certain professionals propose philosophical or historical backgrounds for these controversies and inconsistencies and refer to the heraldic symbol of Russia that was inherited from the Russian Empire: the double-headed eagle, one head looking east and one head looking west. Therefore, Western-like liberal norms and regulations may coexist with anti-Western traditionalist rhetoric that positions Russians as a sovereign and self-sufficient society. Perhaps it is Russian tradition to adopt and adapt foreign solutions and enhance them for internal use, while maintaining a strong survival instinct of historical sediments and a capability of fostering local creativity for using alien practices in a highly centralized environment.

# Innovation Ecosystem

Sanjai K. Parahoo[1] and Madhavi Ayyagari[2]
[1]School of Business and Quality Management, Hamdan Bin Mohammed Smart University, Dubai, UAE
[2]Murdoch University, Dubai, UAE

## Synonyms

Innovation environment; Innovation system

## Definition

An innovation ecosystem has typically been conceptualized as a relatively independent and coherent institutional system primarily comprising of loosely coupled actors sharing a common understanding, and who collaboratively exchange knowledge and ideas leading to innovation.

## Introduction

### Pertinence of Innovation

In a business environment characterized by intense competition among institutions and fickle-minded customers, innovation is crucial for institutional performance. Consequently, innovation studies as a separate field of research emerged in the mid-1960s, and since then such studies have proliferated. A recent stream of the literature is now focusing on innovation in public sector. However, there is a sharp contrast between the respective objectives of innovation in the private and public sectors.

In the private sector, the overarching objective of innovation is to provide differentiated value-added service offers to customers leading to increase in revenues. Conversely, public institutions are required to provide public value in terms of quality, efficiency, or fitness for purpose of governance or services. In the current environment, public institutions are confronted with financial constraints coupled with the need to respond effectively to the growing expectations of citizens. Innovation thus enables the public institutions to pursue their service missions while making effective use of their resources. Governments have thus been encouraged to adopt a collaborative paradigm of innovation by expanding its focus to a continuous process of collaboration and negotiation among citizens, as well as with other stakeholders, leading to an efficient collaborative process to develop and implement good practice.

### Conceptualization of Innovation

It is useful to conceptualize precisely what constitutes innovation. In the service literature, an innovation has been proposed to be an offering not previously available to a firm's customers (e.g., a new service or delivery process) that requires modifications in the sets of competences applied

by service providers and/or customers. The innovation process thus involves collaboratively acting upon various resources that are valuable to a network of actors, including the customer who is the target of value co-creation. In the public sector, Mulgan and Albury (2003, p.3) proposed a broad definition of innovation as novel ideas that work, resulting in the development and implementation of new products, services, and processes, thereby leading to improvement in efficiency and/or effectiveness.

## Achieving Collaborative Innovation

### Success Factors

These conceptualizations suggest that innovation involves collaboration or networking among various actors to leverage available resources effectively and efficiently with the objective of producing a novel offering that adds value to the customer experience. However, although the definition of innovation suggests a simple and easy process, achieving successful and sustainable innovation practices is less straightforward. In this regard, Osborne and Brown (2011) reviewed the public sector innovation literature for success factors, and inter alia, they determined that:

- The nature of insights and breakthroughs leading to innovation implies that an organization should not rely on internal sources alone but should instead interact with a network of actors in the external environment to innovate effectively.
- While innovation may be the outcome of the efforts of an individual employee, an organizational culture conducive to innovation is critical for sustainability.
- Innovation managers need to adopt service-oriented thinking which recognizes the roles of the service recipient and other actors in co-producing a service.

### Challenges

The flip sides of innovation success factors are hurdles that hinder innovation. To successfully achieve service innovation and value co-creation, public sector managers need to address two related major challenges emanating from the new service thinking. These are *value-in-use* and *networking approach to innovation* and are next discussed.

- New service thinking is based on a(n) value and/or experience centric focus, with value conceptualized as *value-in-use*, thereby requiring a new perspective on service innovation. Vargo and Lusch (2004) organized the service literature into a service perspective on value creation and marketing that they termed service-dominant logic (SDL). The SDL perspective conceptualizes service as a process involving the integration of resources and competences among various actors (service provider, partners, customer). Value is considered to be co-created as value-in-use through the positive evaluation of an experience at a particular time, or during a specific exchange encounter. Subsequently, it was proposed that service innovation and value co-creation occurred within a service ecosystem. The SDL literature was in turn further enriched by scholars from the Nordic School of services who discussed the roles, interactions, and contributions of the different actors in the ecosystem in influencing the customers' perceptions of value-in-use.
- Within this new service thinking, there are fundamental changes in the way through which institutions perceive the nature and process of innovation. There is now increased recognition that the insights and ideas leading to innovation, and the innovations themselves need not necessarily emanate from within the boundaries of an institution itself. Instead, the innovations or their precursor ideas/insights may evolve from the joint efforts of a network of actors, including the public institutions, their partners, citizens, and the public at large operating in a coordinated network or system (Osborne and Brown 2011).

To conclude, collaborative innovation is founded on the facilitation of dynamic interactions within a service ecosystem involving a diverse network of actors to co-create value for service

recipients as value-in-use. To overcome the challenges, public managers need to motivate and enable interactions involving a network of actors, as these play a key role in achieving service innovation and value co-creation in the ecosystem.

## Interactions for Value Co-creation in Ecosystem

An interaction is a mutual or give-and-take action whereby two or more actors are in direct contact with each other or have an effect upon one another. Sundbo and Galouj (2000) stated that innovation in services derived largely from an interaction process, both externally and internally, involving actors and customers. In this regard, the driving force for interactions in the ecosystem is the need to integrate and leverage resources in order to co-create unique experiences for the service beneficiaries.

A service provider will become a co-creator of value with its service beneficiaries when effective direct interactions are established between the provider and the beneficiaries. There is a caveat though. Grönroos (2011) warned that the mere presence of interactions did not automatically guarantee value co-creation by the service provider, and the latter could potentially also exert negative (value destruction) impacts on the customer.

Grönroos and Voima (2013) extended the new service thinking by elaborating on the process of value creation and co-creation in service. They defined the roles of the customer and the service provider in achieving successful interactions, as well as the scope, locus, and nature of value creation. They proposed a three spheres model (provider, joint, and customer) for value creation that sheds light on the process by which the service provider and customers interact. In the customer sphere, the customer remains the value creator with service provider acting as value facilitator. However, when the customer invites the provider into the process (within joint or overlapping sphere area), the latter may act as a co-creator of value with the customer. In summary, the interactions potentially result in either the customer creating value independently (customer sphere) or co-creating value along with provider (joint sphere).

Building on the foundation above, a formal discussion of an innovation ecosystem may now be undertaken.

## Innovation Ecosystem

### Conceptualization

Innovation ecosystem derives from systems theory. A system is typically conceptualized as an organized, focused arrangement that consists of interrelated and mutually dependent elements, which impact each other to accomplish the objective of the system. In the new service thinking perspective, an innovation ecosystem has typically been conceptualized as a relatively independent and coherent institutional system primarily comprising of loosely coupled actors sharing a common understanding, and who collaboratively exchange knowledge and ideas leading to innovation.

At this stage, it is useful to discuss the logic behind labelling the actor relationships in the ecosystem as loosely coupled. Sundbo and Gallouj (2000) stated that actors in the ecosystem did not follow precise behavioral norms; their interactions tended to be competition oriented, rather than being driven by formalized contracts or generally accepted norms that were implemented within a long-term frame. Further, they discussed that since there was only some coherence and repetitions, while several patterns were followed during the innovation trajectory, the system could best be classified as loosely coupled. In such a system, actors use soft contracts, as opposed to formal ones, to interact with each other.

### Value Co-creation

Within the ecosystem, service providers influence the co-creation of value by providing guidelines as to what may be considered to be a valuable resource in a particular place and time and how such resources may be accessed, adapted, and integrated in a specific context. Consequently, the ecosystem perspective highlights the key roles of interactions, the social context within

which innovation and value co-creation occur, and finally the integration of resources in innovation. In this regard, the knowledge-driven and customized services commonly available today rely increasingly on beneficiaries contributing to the service delivery and/or providing information for innovation and value co-creation.

As a practical illustration, in the United Arab Emirates (UAE), the Road and Traffic Authority of Dubai has developed a mobile app called *wojhati*, which is a journey planner. It enables a user of public transport (bus, metro, tram, ferry, and taxi) to access the timings of the various public transport modes from a smartphone. The traveler may then interact with the app to efficiently design a convenient trip from A to B within his/her departure or arrival time constraints, check the balance on his/her *Nol* smart travel card (used to pay public transport), and even recharge the card from the smartphone.

### Enablers of Innovation for Value Co-creation

The extant literature suggests that two key factors contribute as enablers of actor interactions leading to innovation and value co-creation: *technological* and *organizational factors*.

The critical enabling role of technology in supporting the actors to engage in dynamic interactions for knowledge sharing and process integration is well established. For example, in the UAE, the Dubai Electricity and Water Authority (DEWA) allows citizens to interact with the Authority using multiple technology-enabled interfaces (online, mobile, email, phone) for various purposes (setting up or closing an account, online payment, or improvement suggestions). DEWA has a virtual assistant based on artificial intelligence called *Rammas* that guides customers in co-creating value by answering their enquiries in real time. *Rammas* is available on multiple platforms, iOS, Android, DEWA's website and Facebook page, Amazon's Alexa, and Google Assistant.

In addition to technology, organizational factors to facilitate knowledge integration play a critical role in the new service thinking perspective. Broadly, this involves rules (protocols) of exchange to facilitate the coordination of actor contributions and their interactions (Lusch and Nambisan 2015). These protocols are implemented within a conducive ecosystem characterized by leadership (Parahoo et al. 2017) and organizational culture that collectively enable and motivate actor interactions and provide institutional resources for innovation and value co-creation (Sundbo and Gallouj 2000).

A practical example from the UAE public sector is the Dubai Corporation for Ambulance Services (DCAS). The Corporation has trained and motivated its staff to embark purposefully on its innovation vision, and it has developed internal schemes for the staff to contribute ideas and insights for innovative services. DCAS has also set up strategic partnerships to collaborate and network with key stakeholders for new service development leading to service excellence for its patients. Finally, DCAS encourages the general public to contribute innovative ideas and insights using web 2.0 technologies. DCAS thus receives numerous ideas/insights, and internal committees screen and review them for approval and implementation. These interactions lead to collaborative innovation, thereby enabling value co-creation.

Further support for the two enablers (Technological and Organizational factors) is provided by a different stream of literature, albeit with a different conceptualization of value creation from the new service thinking perspective. Moore (1995) proposed a public value framework whereby *legitimacy and support* and *capabilities and competencies* mutually interacted to support public value formation. Moore (1995) defined *legitimacy and support* as the credibility of the organization and its activities attained through the organization's contribution to the larger public good, while *capabilities and competencies* depended on resource allocation from the authorizing bodies.

Similarly, the technology-organization-environment (TOE) framework (Tornatzky and Fleischer 1990) proposed that adoption and implementation of innovation at an institutional level are based on three key factors that interact with each other:

- *Technological factors*: the state of technology within the institution

- *Organizational factors*: the institution's size, structure, employee skills, and available resources
- *Environmental factors*: the external environment, including competition, market structure, as well as government policies

## Conclusion

In an era of growing expectations from citizens coupled with resource constraints, innovation has become an imperative for public sector institutions. Governments have thus been encouraged to adopt a collaborative paradigm of innovation in order to deliver enhanced public value in terms of quality, efficiency, or fitness for purpose of governance or services.

The new service thinking literature proposes that collaborative innovation among various actors takes place in an ecosystem leading to value co-creation. An innovation ecosystem has typically been conceptualized as a relatively independent and coherent institutional system primarily comprising of loosely coupled actors sharing a common understanding, and who collaboratively exchange knowledge and ideas leading to innovation. Since the actors in the ecosystem do not follow precise behavioral norms, with their interactions being competition oriented, rather than formalized through long-term contracts, the actor network is classified as loosely coupled.

Within the ecosystem, value is conceptualized as value-in-use when beneficiaries positively evaluate a service experience. Osborne and Brown (2011) reviewed the public sector innovation literature; they identified some success factors for sustainable innovation practices and value co-creation:

- The nature of insights and breakthroughs leading to innovation imply that an organization should not rely on internal sources alone, but should instead interact with a network of actors in the external environment to innovate effectively.
- While innovation may be the outcome of the efforts of an individual employee, an organizational culture conducive to innovation is critical for sustainability.
- Innovation managers need to adopt service-oriented thinking which recognizes the roles of the service recipient and other actors in co-producing a service.

However, to achieve successful innovation in the ecosystem, public managers need to address two major related challenges:

- *Value-in-use* based on a(n) value and/or experience centric focus, which proposes that service innovation and value co-creation occurs within a service ecosystem
- *Networking approach to innovation* which is now recognized to involve the joint efforts of a network of actors, including the public institutions, their partners, citizens, and the public at large operating in a service ecosystem

To overcome these challenges, public managers need to enable and motivate actor interactions in the ecosystem. Interactions represent the mutual or reciprocal action whereby two or more actors are in contact with each other or have an effect upon one another. Supporting actor interactions is critical as the knowledge-intensive and customized services commonly available today rely increasingly on customers contributing to the service delivery and/or providing information.

Within the innovation ecosystem, two enablers support actor interactions for knowledge sharing and process integration: *organizational* and *technological factors*. In the Internet era, the critical enabling role of technology in supporting innovation and value co-creation is well established. In addition to technology, organizational support to facilitate knowledge integration plays a critical role in the ecosystem. The new service thinking perspective considers knowledge renewal a major source of innovation. Broadly, this involves protocols for exchange that facilitate the coordination of actor interactions. These protocols are implemented within a conducive organizational culture characterized by leadership, which motivates actors and integrates other institutional resources toward value co-creation and innovation.

# Innovation in Public Sector Accounting

Eugenio Caperchione
Department of Economics "Marco Biagi", University of Modena and Reggio Emilia, Modena, Italy

## Synonyms

Accounting change; Accounting reform; Accounting renewal; New Public Financial Management; NPFM

## Definition

Innovation is an umbrella term. In the public sector, it refers to the "creation and implementation of new processes, products, services and methods of delivery which result in significant improvements in outcomes, efficiency, effectiveness or quality" (Albury 2005). Innovation is more than "gradually increasing efficiency and making things better," because it requires "doing things differently" (Hartley 2014).

This applies to public sector accounting and financial management, too, which have seen a continuous introduction of new techniques, methods, documents, and processes in many countries over at least the last 30 years. Lüder (1994, p. 1) defines governmental accounting innovations as "conceptual, not merely procedural changes of the accounting system to ensure the supply of comprehensive, reliable and meaningful financial information needed for appropriate financial accountability and sound financial management."

## Introduction

Accounting, at first sight, may seem something fixed, established, not needing major changes. It is often seen as a discipline, and a practice, reserved to highly specialized professionals, who are called to strictly follow some recognized rules and standards; when they conform, most of the work is done. Therefore, accounting experts would not need to innovate accounting systems, which only require some maintenance.

This is a wrong position, hardly corresponding to the reality of public entities. Since the 1980s, a number of countries have introduced, at different government levels, important changes in the components of their accounting systems – and a reform movement has progressively gained momentum, so that the landscape has radically changed.

Over the same period, the academia has focused its attention on public sector accounting and its current design, discussing the shortcomings of its major elements (budgeting, financial reporting, performance evaluation, auditing) and suggesting ways to fix them. Scholars have therefore not only described what was changing but

also given directions on how to change (Lüder 1987, 1988).

A common feature of all reform proposals was a strong criticism toward the cash accounting system, traditionally used in the public sector. Cash accounting, it was pointed out, was leading to following problems (Caperchione 2000, p. 72):

- Short-sightedness of the system. The time horizon of accounting systems, and more specifically of financial reports, only covers the short term, while no reliable information on the impact of policies in the medium to long term is available.
- Limited usefulness for decision-making purposes. Cash accounting hardly provides information linked to actual management processes (as costs by service unit or costs by project).
- Poor readability of financial statements and consequent difficulty in assessing results – so disregarding the citizens' right to know and to evaluate whether their monies have been used for the best.
- Difficulty in assessing intergenerational equity. The incapacity to determine the value of assets and liabilities and to recognize expenses and revenues makes it impossible to assess whether a generation is living "within its means" (Anthony 1983) or is consuming resources it is not producing.

However, the awareness of these limitations was only a precondition; reforms actually started only when financial crises arose in some countries (e.g., New Zealand in the 1980s). At that moment, the abovementioned weaknesses were pointed at as a possible explanation of the crisis, and plans to tackle them were proposed and put into action. General reforms of public administration, and pressure from the accounting profession, added as change factors.

The reforms were given many objectives. Among them is the availability of better information, which would help politicians and managers to take better decisions and consequently would make it easier to pursue effectiveness, efficiency, and what we call today financial sustainability. The possibility of being accountable toward citizens was also an aim of most reforms: various stakeholders require information in order to make evaluations and take circumstantial decisions, and public entities must accommodate these requests.

In recent years, due to the financial crisis, the context of austerity and budget cuts has also influenced innovation, by pressing entities to do more with less. Governments need to overcome financial problems and achieve financial sustainability and therefore introduce new and sophisticated systems, which in some cases also tend to comply with the requests of financial markets (Caperchione and Salvatori 2012).

Innovation, in conclusion, is a main trend in the public sector as a whole (Cangiano et al. 2013, p. 1) and in public sector accounting more specifically. This is of course more true if the analysis is limited, as it is the case in this entry, to OECD countries, for which sufficient information is available – although emerging economies are also experiencing some important accounting reforms (van Helden and Ouda 2016).

The next section gives an account of the most common innovations introduced in the most affluent countries over the last three decades. The differentiation of paths is then discussed in the following section. We then move to evaluate the outcome of the reforms. The final section then sheds light on some challenges currently facing politicians, practitioners, and scholars.

## The most Common Innovations

The renewal of public sector accounting has not followed a wholly uniform path in the different countries: the variety of the starting points and the peculiar political and institutional situations of each country have led to a number of differences. Nevertheless, some common trends can be detected, when looking to countries reforming their accounting systems.

In particular, the following guidelines can be most frequently traced (Caperchione 2006, p. 13):

- Introduction of accrual-based reporting systems
- Introduction of management control systems

- New disclosure and communication policies, aiming at informing stakeholders both on plans and results
- Measurement and evaluation of output and outcome, and comparison with related targets, so that performance can be properly managed
- Setting up of a corpus of national – and later international – accounting standards
- Increased relevance of both internal and external audit

This list is not exhaustive. Among the most important innovations that have taken place, it is also worth mentioning performance and accrual budgeting, performance auditing, popular reporting participatory budgeting, as well as some emerging trends, like integrated reporting.

Accrual-based financial reporting remains anyway the most important innovation introduced, "a symbol of accounting innovation in the public sector" (Liguori and Steccolini 2014, p. 321).

This has obvious explanations, on which it is necessary to focus.

On one side, changing the reporting from a cash to an accrual basis (or even only adding the latter to the former) implies an enormous amount of work for administrations, since the whole reporting logic is subject to change, new software has to be introduced, and most procedures have to be modified.

On the other side, accrual accounting has become over time the accounting system of private companies, and its adoption is therefore inextricably linked to the idea that public entities have to adopt businesslike tools and logics, if they want to increase their efficiency and effectiveness – which clearly is a fundamental change of perspective.

This situation is not the result of mere technical and neutral interventions. Large private sector consulting firms have played a non-negligible role in promoting and implementing public sector accrual accounting (Christensen 2005), initially in single countries and later on at international level.

## The Different Implementation Paths

The existence of common trends does not mean that all countries followed the same paths or introduced exactly the same innovations.

On the contrary, if we look to single countries (and even to different levels of government within each of them), we can notice different choices about contents and quite significant variances in the processes.

As to contents, the first noticeable element is the fact that "accrual accounting" does not really always mean the same. In a way, rather than being a precise technical term, it risks becoming a sort of label or "an increasingly multifaceted concept" (Liguori and Steccolini 2014, p. 321), used for diverse and sometimes even diverging solutions.

Since the beginning of the reform movement, scholars have clarified that the design of the accounting system requires a significant number of decisions; and each country's governmental accounting system is the result of how all subsystems are organized and integrated.

These choices concern, among others, the reporting entity, the accrual accounting bases, the measurement concept, the existence of a conceptual framework – and the contents thereof, the specific accounting policies for pensions and taxation, the contents of the financial reports, and the documents actually produced and their dissemination (Lüder 1989; Chan 1996). It is then to check whether accrual reporting substitutes or simply supplements cash reporting, whether an accrual budgeting has been put in place, and what rules are used to finance public entities and to cover deficits – or use up any surplus (Lüder 1999, p. 35). When all these choices are considered regarding the technical aspects of accrual-based budgeting and accounting reforms, it becomes clear that even within a small sample of the major, developed economies, there hardly is any consensus about "the complete package of technical reform possibilities that is most appropriate" (Jones et al. 2013, p. 419).

The process of change itself is no less important.

Countries (or specific legislatures) can privilege a top-down approach when designing the reform or can leave room to proposals elaborated at local level: the former approach may be aimed at ensuring a higher uniformity, and to speed up the reform, while the latter can be more adequate to consider the needs of those who have to use the new tools.

Whatever the choice, the system may be imposed just after its design, or a gradual implementation may be allowed, so to make it easier for governments to prepare and to adjust to it.

In some cases, tests are conducted in pilot administrations, in order to verify whether problems may arise during the implementation and to fix them.

Additionally, various support mechanisms can be put in place, like staff training, technical assistance, central production, or purchase of accounting software.

If the change process is correctly managed, this can simplify the diffusion of the necessary skills in all public administrations. The reform of the accounting system, and especially the introduction of accrual-based reporting – let alone budgeting – is a huge task, which cannot be carried out in a too short time or without adequate human resources or knowledge management systems.

At the same time, managing the process can also help building a wider agreement about the aims and the contents of the accounting innovations.

## The Outcome of the Reform Processes

Reforms and innovations are interesting per se, as a testimony of the creativity and engagement of politicians, scholars, and professionals; but it is from their benefits that they must be judged.

A deeper look into the actual impact of innovations is therefore needed. To this aim, the most relevant areas of investigation concern:

- What innovations have actually been implemented
- Where this has happened
- An analysis of their effects

All this will make it easier to give an appraisal of the single reform processes and of the reform movement as a whole.

In order to answer these questions, a comparative perspective may be helpful.

A first relevant point to be made is that the innovations presented in this entry were not implemented without problems. In particular, with regard to accrual accounting, it is worth noting that this reform requires an overall modernization of public management culture. Moreover, this system bears with it significant costs, in order to record and evaluate the assets and liabilities, to introduce an appropriate ICT system, to diffuse the necessary skills, and to keep the pace with the evolution of the rules.

Additionally, the newly designed systems present quite often some contradictory elements, e.g., the persistence of the reference to cash for appropriations.

As to the process, Lüder (1994, p. 10) identifies two alternative approaches, the accountability-driven and the managerialism-driven approach, which can lead to different orientations of the reforms.

Coming to the geographical spread of reforms, countries have not all picked up the same innovations nor have they all followed a similar implementation path.

In other words, a thorough analysis cannot be limited to the simple verification of what countries have applied accrual accounting to public entities, but must be supplemented with more detailed information on a number of specific choices. It becomes then apparent that the landscape is rather varied and fragmented (Liguori and Steccolini 2014) – and this holds true also with countries with strong linkages between them, as is the case of the European Union (Brusca et al. 2015).

It is therefore clear that reforms have not necessarily brought about a real harmonization of accounting and reporting systems. Moreover, cash accounting remains at the core of many a

system, so that a "resilience of traditional budgetary accounting" can be identified (Jones et al. 2013, p. 419).

Multiple choices exist also with regard to the accounting standards. While International Public Sector Accounting Standards (IPSAS) are gaining momentum and are being used by a growing number of countries, in other cases national sets of accrual-based accounting standards have been developed. These can be inspired by IPSAS, by Financial Reporting Standards (IFRS), or be country-specific. At EU level, Eurostat is trying to produce a set of European standards.

The appraisal of the reforms' effects is no easy task. Some of their objectives have been met, and some others have not; in other cases, expressing a clear judgment is not possible.

The evaluation is relatively positive, if introducing accrual reporting is considered a crucial point – or if the availability of information on assets, liabilities, costs, and revenues is concerned.

Other positive aspects may be found in the greater attention paid to transparency (Lourenço et al. 2013) and accountability and in the awareness of the important role of accounting and reporting for a sound management of public entities.

Important actions have therefore been put in place in order to train staff and allow them to work with the new systems.

Finally, the existence of an international standard setter, although lacking formal enforcement powers, may contribute to the diffusion of a common accounting language.

However, some other aspects of the reforms may prove less satisfactory.

The additional information provided is not necessarily used when taking decisions (van Helden et al. 2016); if it is used, there is no evidence that the quality of decisions and consequently the performance of public entities do improve. Citizens, despite many reference made to their curiosity about the financial situation of the relevant public entities, show a limited engagement in collecting, reading, and debating accounting data.

Moreover, harmonization is far to be reached; and doubts are being raised about the capacity of the accounting standards in use, largely derived by IFRS, to correctly consider some important specificities of public entities.

Finally, the fact cannot be overlooked that the more contextual the modernization of accounting is to the overall modernization of the entire public administration of a country, the more meaning and vigor it acquires. Whenever it is reduced to mere technicality, it hardly ever produces the expected results.

An overall judgment, thus, can only reflect these lights and shadows. There are some even important positive aspects, but "accounting reforms have fallen short of expectations" (Liguori and Steccolini 2014, p. 321). If innovations are meant to bring about significant improvements in outcomes, efficiency, effectiveness, or quality (as per the Definition at the top of this entry), it is not possible to state that all of them did. This is also because too many variables (also external to accounting) have to be taken into consideration, when explaining the behavior and the results of public entities.

## The Next Steps and the Challenges for Politicians, Practitioners, and Scholars

Over the last 30 years, public sector accounting has been the object of many innovations – and this will probably continue in the future.

Practitioners and professionals are promoting and testing new tools, and the academia is following this movement with great attention. Some innovations are directly driven by the use of ICTs, Internet, and social media, which make it easier to distribute information and data – also big data. Some others are the outcome of a reflection over the most appropriate ways to help public entities to be managed and to communicate with their stakeholders – although these two sources of innovations are not mutually exclusive. Popular reporting, sustainability reporting, integrated reporting, participatory budgeting, and whole of government reporting are all tools whose relevance is likely to grow in the near future.

This continuous reform process is not without risks, however.

The accounting and reporting systems are getting very sophisticated, and their technical functioning becomes sometimes even too complicate. The objectives served increase in number, but it is unsure whether a single accounting system may actually serve all of them. Additionally, in some legislations a shift is apparent, from accounting as a management tool for the individual public entity to accounting as a way of giving central governments (and the European commission) the information needed to exercise their supervision.

Thus, some challenges have to be tackled, if the innovation process has to be further developed; among them, scholars identified the influence of the political process, the requirement of professional skills, the need for a cultural change, and the fact that reforms must treat financial management as a social practice (Caperchione et al. 2016, p. 306).

Confronting with these challenges is a task for everybody engaged in accounting: politicians, accounting practitioners, scholars, and the accounting profession all bear the responsibility of providing public administrations with an accounting system fitting their real needs and giving the required information at a reasonable cost.

Once the system is chosen, practitioners have to make every effort so to correctly implement it and carry it on (Caperchione 2006, pp. 13, 17).

As to scholars, they are well placed on one side to evaluate pros and cons of each innovation and on the other side to make proposals for further developments. International networks of scholars may be an added value in this perspective.

# Innovation Policy Governance

Pedro L. C. Cavalcante
Institute of Applied Economic Research (IPEA), Brasilia, Brazil

## Synonyms

Governance arrangement; Governance capacity; Innovation policy mix; National innovation system; Policy instruments; System of innovation

## Definition

The definitions of innovation policy governance are twofold and complementary. First, as an analytical framework for studying the dynamic arrangements of actors, institutions (rules of the game), ideas, arenas of interactions, and policy instruments related to innovative activities in a particular country or region. Second, from a practical approach, as the set of governmental and nongovernmental efforts to design and implement a policy mix to foster innovative performance in an economy.

## Introduction

There is an increasing consensus among academics and policymakers that innovation growth is essential for driving economic progress, increasing competitiveness, and boosting job creation in developed and developing countries (Nelson 2016; Cirera and Maloney 2017). Innovations as new products, services, processes, or business models used commercially or noncommercially may also contribute to solutions for urgent societal challenges (Edler and Fagerberg 2017) and improve citizens' welfare. In this sense, innovation policy governance has become strategically valuable for the economic development agenda, and scholars are interested in deepening this complicated phenomenon (Cirera et al. 2020).

Nonetheless, as with all governance concepts, innovation policy governance encompasses a wide range of understandings that demand careful analysis of their primary goals, features, and uses. For this article's purposes, innovation policy governance may be defined as two different but complementary holistic and systemic approaches. First, in analytical terms, it means the dynamic arrangements of actors, institutions (rules of the game), arenas of interactions, and policy instruments related to innovative activities in a particular country or region. Second, from a practical approach, innovation policy governance consists of the governmental and nongovernmental initiatives to orchestrate, prioritize, design, and implement a policy mix in different sectors to promote the innovative performance of firms and public organizations in a particular economy.

The following sections will briefly discuss this debate's theoretical background, grounded in the National Innovation System (NIS) literature. Then, the article details the two analytical

and practical perspectives on innovation policy governance. Finally, some conclusions are highlighted.

## The National Innovation System

The understanding and rationales of the two definitions of innovation policy governance originate from the National Innovation System (NIS) literature. The NIS concept first emerged during the late 1980s and early 1990s. Since then, it has become popular among policymakers willing to undertake the generation of scientific knowledge, technology, and innovation in state policy missions (Edler and Fagerberg 2017).

The approach is openly skeptical, with government interference restricted to overcome market failure since innovation flourishes in an arrangement of interactions between firms and entrepreneurs with bounded rationality and institutions in constant evolution (Cirera et al. 2020). According to Nelson (2016), the National Innovation System is a strand of research that recognizes the complexity of many market relationships, their embedding in broader social and institutional structures, and the elements of cooperation and trust that often are essential if markets are to work well. It also acknowledges the role of non-market institutions like university and public- research systems, scientific and technical societies, and government programs in the innovation process in many sectors.

As a social system, the term "innovation system" encompasses various institutions involved in supporting and orienting economic activity dynamics where innovation is the key driving force (Lundvall 2010). The NIS approach is in line with the evolutionary theory that assumes the economy is frequently in a state of change with agents and organizational routines differing, which is fundamental for the system's dynamics (Nelson 2016). Moreover, institutional structure and innovation processes are path-dependent, occur mostly in an unplanned manner, and above all, are gradual and cumulative (Lundvall 2016). It is far from a single event such as the well-known "catching-up" phenomenon, meaning the "process in which a late-developing country narrows its income gap (as one may specify by the word 'economic catch-up') and in technological capability (equally 'technological catch-up') vis-à-vis a leading country" (Odagiri et al. 2010, 2–3).

Orthodox economics is preoccupied with the institutional arrangement that affects the optimal allocation of existing resources and emphasizes how agents make choices based on given sets of information and competencies. The NIS scholars worry about how different institutional setups affect new resource creation and address how knowledge – both information about the world and agents' expertise – changes the economic process. In the current "*globalizing learning economy*" (Lundvall et al. 2009), to understand countries' innovation performance, the analysis must go beyond the traditional focus on science or the core of the innovation system (firms and knowledge infrastructure). It must encompass the wider setting, i.e., institutions and organizations that nurture competence-building and institutions that shape human interaction concerning innovation.

This comprehensive view of the phenomenon goes beyond the focus on research and development (R&D), as it includes other dimensions of analysis in the innovation system such as the labor market, education system, financial institutions, regulatory structures, and other institutions that shape economic dynamics. The system elements reflect how the innovation capabilities are structured and the outputs, which may also be influenced by various other factors such as historical experience, language, culture, etc. Undoubtedly, as technology is science-based, the education system, research, and financial systems are vital. For instance, the countries that have been "catching up," for example, South Korea and Taiwan, have prioritized these systems for decades. In this context, the public sector plays a crucial role in education and R&D, whereas the financial sector affects how firms organize and form networks (Cimoli et al. 2009; Lundvall 2010). In this approach, public policies and programs are not only an essential part of the engine (Nelson 2016), but inevitably governments must plan, design, and implement innovation initiatives

systematically and in a dynamic way (Cirera and Maloney 2017).

In general, institutions and government policies and programs matter, for better or for worse, in the process of innovation. As a result, the state usually has diversified responsibilities by supporting science and development, creating the business environment, setting regulations and standards, fostering interaction and cooperation between firms, and being the primary user of innovations from the private sector. The emphasis on policy, institutions, and infrastructure related to innovation activities guides innovation policy governance concepts.

## Innovation Policy Governance

### Analytical Framework

With the analytical framework view of innovation policy governance, the focus is on the dynamic arrangements of actors, institutions (rules of the game), ideas, arenas of interactions, and policy instruments related to innovative activities in a particular country or region. In the same vein, Rickne et al. (2011, 5) argue that "innovation governance refers to the processes where a set of different actors in various ways – together or separately – implement arrangements that aim to influence the innovation input, process, and outcome (in general or for a specific area)."

From this perspective, governance may be seen as a heuristic, i.e., as a technique to explore and analyze the complexity of the policymaking process. Scholars must observe the broad social and institutional context and the dynamic interactive processes in which policies are embedded. The main goal is to describe the relevant actors (inside and outside government), institutions, and arenas and analyze how they interact and affect the innovation policymaking and the innovative performance of a particular economy. Figure 1 details the main innovation governance arrangement components as an analytical framework.

This framework allows us to both investigate how all the essential components of innovation policy governance function together as well as to focus on its specific dimensions. The first strategy may help assess a country's innovation governance development and compare different maturity and achievement levels among emerging and advanced economies. Simultaneously, the latter addresses the analysis of questions such as how the arenas of interactions operate, the role of ideas affecting the actors' behavior or institutional changes, and how policies affect innovation inputs and outputs, among others.

**Innovation Policy Governance, Fig. 1** Analytical framework for innovation policy governance

This model assumes that innovation policies are consequences of the sustained interrelation among actors (firms, public organizations, universities, third sector organizations, and international entities) with different interests and geographical scopes in an increasingly globalized world. In this sense, it reflects dynamic, not stable, modes or arrangements affected by changes in the actors' strategies and performances. The more pluralistic the external environment, the more relevant the innovation to public opinion, and the higher the priority for the government agenda, the greater the pressure on governance dynamics will be.

In this context, the innovation policy mix must be analyzed due to these processes, which depend mainly on the public sector capacity. The choice of policy instruments is mostly influenced by the public administration's ability to design and implement them. The resulting policy mix tends to be a hybrid arrangement with a combination of policies based on hierarchy, market, and network governance mechanisms (Borras and Edquist 2013). The state capacity is also a critical dimension to determine how effective the policies are in resolving political and policy issues. Therefore, the governance capacity must be studied not as restricted to defining goals and strategies to reach them, but primarily with an eye towards coordinating and building the necessary political consensus among the actors involved in this policy field (Capano et al. 2015). Governments typically play a protagonist role in innovation policy governance, making them an important subject of analysis within the context of the holistic arrangement detailed above.

### Practical Approach

The second definition of innovation policy governance refers to governmental and nongovernmental efforts to design and implement a policy mix aimed towards innovative performance in an economy – has a distinct but complementary emphasis. It consists of prescriptive orientations for policymakers and involves important issues that subsidize governments and other stakeholders to discuss paths, challenges, and dilemmas involving innovation.

This approach is increasingly relevant due to the emerging consensus that the quality of the governance arrangement and, consequently, the quality of the innovation policy matters. This approach emphasizes organizations, both governmental and outside the public sector, and associated resources, institutions, strategic goals, and other factors. They together are crucial to creating knowledge accumulation, fostering the process of learning, and, as a result, facilitating technological transformation and economic progress (World Bank 2010; Lundvall 2016).

In this context, the literature agrees that the proactive government role in supporting the broad capabilities, exchange, cooperation, and interaction to produce knowledge and innovation demands a comprehensive and holistic perspective. This is true not only in terms of acting in complementary public affairs spheres (such as education, R&D, and infrastructure) but mainly in promoting intense horizontal coordination among ministries and departments as well as with civil society and the market (Edler et al. 2016; Edler and Fagerberg 2017; Borras and Edquist 2013).

One way of looking at this is returning to the analogy of government as a gardener through which policies should identify, protect, and promote interactive learning spaces (World Bank 2010). The public sector, with the possibility of partnerships with nongovernment organization, must perform in a governance mode that requires enabling innovation processes by using the right policy mix in different areas to:

- Support innovators through appropriate incentives and mechanisms (*watering the plants*).
- Remove obstacles to innovative initiatives (*removing the weeds and pests*).
- Establish responsive research structures (*fertilizing the soil*).
- Form a creative and receptive population through appropriate educational systems (*preparing the ground*).

As innovation is knowledge-intensive, a coherent cross-sectoral innovation policy demands that the decision-making processes are based on policy learning. It is a key element of innovation governance to ensure coordination and integration and achieve better performance (OECD 2005). However, what is an innovation policy mix? Also called a bundle or portfolio of policies, it refers to public interventions or instruments, usually designed and administered by a government including multiple agencies at various spatial levels, that affect the structure and performance of an economy to support the generation and diffusion of innovation (Edler et al. 2016).

Thus, it is essential to understand how policy mixes interact, which can be complementary or

supplementary, generate synergies, or even become counterproductive. This avenue for research is quite broad, encompassing areas ranging from the emphasis on the choice of the instruments, whether the policy approach is coordinated or not, the types of interaction and dimensions in which these interactions occur, including time and geographic spaces in specific policy areas, the level of stakeholder engagement, as well as the process of policy mix implementation and evaluation and its resulting impacts (Edler et al. 2016).

There is no doubt that a great variety of country and sector-specific combinations between the types of innovation policies exists. For instance, it is well-known that countries from the Organization for Economic Cooperation and Development (OECD) have innovation systems with mature institutions and comprehensive, multifaceted, and sophisticated policy mixes in contrast with the emerging economies, where innovation policies are often embryonic and fragmented (Cirera et al. 2020). Innovation policies usually need to balance initiatives addressing capability-building with mechanisms curbing inertia and rent-seeking. As Cimoli et al. (2009, 29) put in reference to these competing factors, "The latter is indeed one of the major elements missing in the old Latin American experience of import substitution while the former is what is lacking under many more recent liberalization policies." Besides, Cirera et al. (2020) suggest that policymakers' conception of innovation policy must advance beyond the traditional institutions and policies to overcome the innovation-related market failures and include these broader complementary factors and supporting institutions.

## Conclusion

Therefore, the policy challenges that are faced by countries in a variety of strategies and conditions result in different stages of innovation governance: mature (well-functioning) governance or systemic failure. The latter occurs whenever the economy lacks the fundamental building blocks that are able to support the creation, absorption, use, and dissemination of useful knowledge through interactive learning (Lundvall et al. 2009). It tends to be the usual condition in developing countries trapped by structural issues, such as poverty and inequality, where the resources are limited and the managers can carry out these programs and policy measures are scarce (Cozzens and Kaplinsky 2009; World Bank 2010). According to Cirera and Maloney (2017), the challenge seems even more problematic because they must deal with the innovation policy dilemma, as described in the following excerpt:

> The greater magnitude of the market failures to be resolved and the multiplicity of missing complementary factors and institutions increase the complexity of innovation policy; at the same time, governments' capabilities to design, implement, and coordinate an effective policy mix to manage it are weaker. (Cirera and Maloney 2017, 111)

In this sense, for furthering the development agenda, it is also crucial to understand the cases of nations that have continued to improve their high level of innovation capacity, those with successful catch-up processes, and the developing countries that are still struggling to increase innovation to overcome their lagging productivity.

The analyses of innovation policy governance help comprehend the occurrence of these situations and compare them. Advances in exploring how innovation policy governance is structured and actually operates is undoubtedly a prominent subject for the public administration field. It seems even more important because the concepts are still in the progress of being developed. Simultaneously, there is an increasing demand for evidence-based knowledge for better governance arrangements in different political, economic, and administrative realities in which innovation policies are formulated and implemented worldwide.

## Synonyms

Administrative reform; Modernization; Organizational change

## Definition

In the context of Public Administration, Public Policy, and Governance, innovation can be defined as a process that requires individuals and organizations with capabilities to enable the identification and implementation of ideas (new, improved, or renewed), which have been systematized for the context of its application, serving as solutions to problems that imply better performance in terms of efficiency, efficacy, and value of public sector results for society.

## Introduction

The basis of innovation conception is to consider any thinking, behavior, or thing as a novelty because it is qualitatively different from the existing forms. This conception approaches the notion of invention, since it is an intentional and premeditated action. However, the term invention has been commonly used to denote technological innovations (Barnett 1953) and social innovations (Taylor 1970). The difference between these two contemporary notions, derived from the concept of innovation, is that the former has market focus and depends on industrial application (Dantas and Moreira 2011). The second concentrates on solving a community problem with the articulation of resources, preferably indigenous and citizen

I

participation in specific contexts. Besides invention, there is also the idea of diffusion, which relies on the perception, interests, evaluations, judgments, and adoption by users or consumers of innovation (Rogers 2003).

The relationships between innovation, invention, and diffusion were dealt with in Joseph Schumpeter's book *Theory of Economic Development* published in 1911. In this work, innovation is regarded as one of the central phenomena of the development of nations by generating disturbances of equilibrium and/or rupture in the existing order, promoting changes, be they material or value (Schumpeter 1934). This work is considered seminal because it laid the foundations for the understanding of innovation on which research on the subject has multiplied, in different disciplines, forming a dynamic and polysemic field of study, which increasingly involves the public sector, including Brazil.

Innovation has been presented in Public Administration, Public Policy, and Governance as a necessity with the premise of dealing with the constant and continuous state and public problems in a new way. Innovation has also acquired an important administrative and political interest because its adoption and effectiveness contribute both to the distinction and possible competitiveness between organizations and territories on different scales (municipalities/cities, regions/states, country/nation) and for the distinction of individuals elected between a managerial mandate and another. In this sense, such distinctions are based on the idea of change, which, although treated as synonymous with innovation, has a difference because it is linked to the past, being malleable as a result of a trajectory of successive changes within a continuum of aggregations. On the other hand, innovation, albeit on a small scale, closes the phenomenon of discontinuity with the past, both to an incremental degree – focusing on operational improvements in routines and the provision of public services, as radical, transformational, or disruptive – with structural changes and in terms of internal and external relations of power to Public Administration (Osborne and Brown 2005).

Modernization has also been considered synonymous with innovation in the public sector insofar as it expresses a processual form of making changes in Public Administration. Another form that became internationally known since the 1960s was administrative reform, which seeks to contemplate planned changes in Public Administration (Motta and Caravantes 1979) where (i) the development of bureaucracy and managerial capacity would be a means of ensuring the efficiency and effectiveness of public organizations and (ii) the organizational values include the social values of public organizations in administrative reform programs and their strategic objectives as a means of guaranteeing their effectiveness. For a broader understanding of the proposals and results of the administrative reforms in Brazil's public sector in the twentieth century, see Lustosa (2008). However, it should be emphasized that administrative reforms with interests of modernization, de-bureaucratization, and improvement of Public Administration have been perennial themes in the governmental agendas in Brazil after the post-dictatorship constitution enshrined in 1988, including, more recently, aspects such as the responsiveness of society and the digitization of public services, including internet access.

## Innovation Systems

The systemic approach has been one of the most used to define and seek and to interpret innovation in different countries (OECD 2018). In this approach, for innovation to take place, it is necessary that there be joint action of different organizations, which generate new ideas and technologies within an institutional system, capable of application and promotion of development (Van de Ven 1986).

In this sense, the innovation system is treated as a set of related organizations in a reciprocal way that, in the search for a dynamic equilibrium, influence and are influenced by an environment composed of broader systems (political-administrative, legal, and economic) as well as

other systems (science, education, religion, mass media, etc.), which compete for different resources (Vidal 2017) according to the choices made by each one of them.

Therefore, innovation as an interactive system proves to be a more dynamic and sociocentric approach, which emerges as an alternative to the state-centric perspective, in which the state, through government, normatively determines interactions between organizations in the context of innovation. In Brazil, the state-centric viewpoint was dominant in the last century, but the sociocentric perspective has been gradually employed in Public Administration, Public Policy, and Governance with the adoption of the public sector innovation system (PSIS). Thus, the notion of PSIS begins to gain more applicability from the twenty-first century to become the object of scientific analysis by the specialized community and the expansion of the international movement for open government. This movement has been intensified with the use of information and communication technologies (ICT's), in order to provide more transparency, responsibility, accountability, and social participation in matters of public interest or that face the common good, such as situations of administrative improbity (Law 8.429/1992).

The Organization for Economic Co-operation and Development (OECD) is an international organization that has been instrumental in disseminating guidelines for the development of innovation based on a taxonomy of practices. This taxonomy is composed of four types of innovation: (i) product (good or service), (ii) process (of work), (iii) organizational (management), and (iv) marketing.

These types of innovation have been proposed since the 1990s by the OECD in its guidelines for collecting and interpreting data on innovation that has aided governments in the economic development of their territories and more recently in public policy and management. These guidelines have become internationally known as the Oslo Manual, a document that has served as the guiding principle for internal and external policies aimed at fostering innovation in public and private organizations in different countries. In Brazil, OECD Guidelines have influenced governments and public organizations, mainly at the federal level, due to their institutional capacity to promote and disseminate actions for innovation.

## The Public Sector Innovation System in Brazil

The emergence of Brazilian PSIS in the contemporary era is the result of governmental actions, mainly in the federal scope, since the 1960s. Actions were taken to create public organizations by the executive branch to encourage innovation in the country as the Financier of Studies and Projects (Finep) (1965), the Ministry of Science and Technology (1985), and the National School of Public Administration (ENAP) (1986).

Instruments for the financing of research, development, and innovation projects were also created, such as the National Fund for Scientific and Technological Development (FNDCT) (Decree-Law 0719/1969) and territorial integration policy instruments through sectoral funds (1997). These are complementary sources of funds to finance the development and innovation of strategic sectors, as well as to promote the deconcentration of science, technology, and innovation activities and the consequent dissemination of their benefits to all regions of the country. Another form of stimulus adopted to foment and diffuse innovation in the public sector in Brazil was competitions and prizes of innovation created in the federal scope like the one of ENAP, existing since 1996, that has recognized good innovation practices in the sector related to organizational processes and services or public policies.

Even with these initiatives of the federal government, there was not yet an environment favorable enough for innovation, marked by the lack of clarity in the attributions and social role of organizations involved in the public-private relationship at the federal, state, and municipal levels. This mobilized the stakeholders of the innovation that culminated in the advent of the Innovation Law (No. 10.973/2004), which was later revisited and updated, seeking to improve legal certainty in interorganizational relationships and in the

innovation process, being called the new regulatory framework for Science, Technology and Innovation (Law no. 13.243/2016).

In the decade of 2010, emmerging as new governmental actions, such as the creation of public innovation laboratories in addition to the executive power at the federal level, including organizations of the legislative and judicial branches, regulatory agencies of different sectors (i.e. health, transportation, finances), and subnational governments in Brazil.

Innovation labs in the public sector are practices, work units, or organizations, with the capability of acting as agents of change, having autonomy in the definition of their goals and methods, as well as aiming at initiating the use of new ICTs in government and in relation to society. Its foundation is based on user engagement, cross-industry collaboration, open innovation, and new ways of collecting data and insights (Puttick et al. 2014).

The occurrence of several innovation laboratories in Brazil's public sector has stimulated the formation of informal and formal innovation networks such as InovaGov in 2016. The InovaGov network has sought to foster the innovation system inside and outside Brazil through a technical cooperation between the federal audit court (TCU); the Ministry of Planning, Development, and Management; and the Federal Justice Council.

However, the use of the PSIS concept in Brazil is still recent and has circulated primarily at the federal level, based on works and cooperation agreements with the OECD, mainly through its Observatory of Public Sector Innovation (OISP) created in 2014. It is still difficult to indicate all the organizations that effectively make up the PSIS in Brazil due to the absence of coordination mechanisms that can accompany the systemic performance of organizations working in the context of innovation in the public sector. This absence is a historical reflection of the legal structure of the country in relation to innovation practices, which need to be linked and authorized by specific laws and regulations.

This legal framework means that risks in the innovation process, which should be shared at the systemic and organizational levels, are fully assumed at the individual level, i.e., public servants are fully accountable for their decisions and subject to audit. This condition generates an environment of risk aversion and diversified engagement in relation to innovation in the public sector (OECD 2018). Despite this, since the 1930s, innovation in Brazil has also been gradually associated with entrepreneurship in the public sector, as it has enabled the introduction, orientation, and implementation of solutions to state and public problems (Emmendoerfer 2019), and more recently it has stimulated the formation of collaboration networks and communities of practice for innovation in this sector.

## Strengthening Innovation in Brazil

For the development of PSIS in Brazil to be effective, it is necessary to carry out certain actions by national and subnational governments to strengthen the system, so as not to inhibit the innovation actions that already occur at the individual and organizational levels in the public sector.

One action would be to establish state planning for the promotion of an innovation culture in public service in an intergovernmental way and in partnership with the private sector to predictively and even sporadically deal with possible disruptive changes to better meet the demands of the Public Administration itself and society.

This requires reviewing a whole historical context of culture, norms, and principles that usually function as focal points of resistance to innovative efforts in Brazil. This involves reviewing normative aspects such as laws, regulations, norms, and the redemption of basic constitutional principles that condition and govern ethos in the public sector in Brazil, such as legality, impersonality, morality, publicity, efficiency, legal security, motivation, ample defense and contradiction, unavailability of public interest, supremacy of the public interest, and continuity of public service.

The absence or non-incorporation of these principles into a system of innovation, which reiterates the public ethos, can increase the risk of the blind pursuit of essentially individualistic goals in the daily activities of public service, as well as

disregard public value and limited scope of the common good in society. Thus, in Brazil, the incorporation of basic principles of Public Administration into innovation plans and actions has gradually fostered a civic spirit so that entrepreneurship in the public sector is strengthened by a culture of citizenship (Bellone and Goerl 1992), increasingly marked sociopolitical participation in the development of its PSIS. This can become a trend to deal more efficiently and effectively in crisis situations, as well as outlining more advantageous governance structures and policies for innovation systems.

# Innovations for Administrative Reforms in Korea Revisited: A Case of Local Autonomy

Jong-Hae Yoo[1] and Deokro Lee[2]

[1]Maesan Research Institute, Seoul, South Korea

[2]Department of Public Administration, Sejong University, Seoul, South Korea

## Introduction

The South Korean local autonomy system started in 1952 and was implemented for 9 years until it was suspended by the military regime in 1961. It was then reinstated before the staging of the Seoul Olympics in the fall of 1988. This democratic self-governing system contributed not only to achieving national balanced development but also to maximizing citizen's political participation. In addition, the government's responsiveness and accountability to its citizens was enhanced.

This section provides an academic basis for reinstating local autonomy by providing a systemic review of local self-governing experiences and analyzing the need of and potential for the local autonomy in South Korea. In the light of certain critical factors, an attempt is also made in this study to propose a desirable and feasible system that will be appropriate for South Korea.

South Korea has experienced more than five decades of dramatic economic development, during which its per-capita GDP increased from $80 in 1960 to $32,800 in 2018. The stages of this growth in Korea can be broken down into three

periods: (1) the establishment of South Korean government in 1948 and up through the 1950s, that is, the stage of nation building; (2) the 1960s–1980s, which is called the stage of economic takeoff and construction of the national economy; and (3) the 1990s and after, which may be regarded as the stage of the welfare state for equitable redistribution of income and greater political participation by the people.

During the stages of nation building and economic takeoff, powerful centralized government and its bureaucratic administration functioned as the most appropriate apparatus in guiding economic planning and implementation of development policies. In these stages, a significant number of local development projects were planned and managed by central officials and planners within the context of national development plans. Critical resources were also mobilized and allocated primarily by the central government.

Since the 1980s, however, significant changes have taken place in Korea, in particular, a wave of major social changes, such as higher education level, increased income level, and greater demand for a higher quality of life. This has had a greater impact on people's political expectations as well. Moreover, there signaled a new wave of distrust of and resistance to the excessive power of the central government.

These factors tend to enable people to ask for greater opportunities to participate in policy-making processes, and for decentralization of power to the local level. These demands for decentralization must be interpreted in connection with the strong and sincere desire of the people at all levels of society for both "democratization" of the political process and active participation in their own government. The people at the local level desired local solutions to local problems, increasingly advocating broader discretionary power. Local officials also expressed feelings of inconvenience with stringent central government control over local affairs. Finally, in response, the central government has advocated that local autonomy would be reinstated gradually in the early part of 1987. This was later postponed until after the 1988 National Assembly elections.

The reason that people want to participate in policy-making processes, especially in the regional development policy, is due to the failure of the centralized metropolitan policy to address specific needs of local communities. (Even though the central government want to implement some land development policy for some local areas, it frequently failed. Because it didn't exactly know about the specific environment and sentiments of the local communities.) Thus, there has been a serious disparity between metropolitan and provincial areas. In South Korea, the over-concentration of the population in metropolitan areas such as Seoul, Pusan, Taegu, and Inchon has accelerated since the rapid industrialization of the country. The physical size of Seoul is only 0.63% of the land mass, but almost 10 million people, 20% of the population live there. Furthermore, as of 2015 not only important facilities and resources – such as 69.2% of deposits and 65.3% of loans, 47.42% of the business – but also substantial opportunities for socialization of people were concentrated in the greater Seoul area including Kyunggi Province and Inchon (Korea Research Institute for Local Administration 2018). Under these circumstances, one of Korea's national policy goals is to redisperse the population and capital of the metropolitan areas back to the rural areas and to develop middle-sized and small cities by encouraging so-called U-turn migration (Cho and Kim 1985). In order to accomplish these policy objectives, it seems essential that a desirable system and strategy for local autonomy should be one that encourages people to live in localities.

Based on a review of the context of South Korean local autonomy since 1949, the presupposition of this section is that local autonomy is the best avenue for local participatory democracy and one of the best solutions for overpopulation in metropolitan areas.

## History of South Korean Local Autonomy

### Changing Process of the Local Autonomy Act

Established on August 15, 1948, South Korea adopted the local self-government system by the

promulgation of the Local Autonomy Act on July 4, 1949. With this act, local assemblies were constituted in such localities, as province (Do), city, town (Eup), and township (Myun), even though the heads of local government were not elected directly be residents. (Even though the assemblies were constituted, the heads of the local governments were appointed by the central government for a while.) This local autonomy system was relatively new to South Korea, which had a long tradition of centralized power system. But it has been radically changed since the first amendment to the Local Autonomy Act on December 15, 1949.

During the Korean War, the first popular elections for local assemblies in the cities, towns, and townships were held in April 1952. With the exception of Seoul, Kyunggi, and Kangwon provinces, which were in war zones, elections for provincial assemblies were held in May of the same year. The fact that local elections were held, despite the nation's involvement in war, does not necessarily mean a strong desire for decentralization and grass roots democracy but may imply hidden political intentions of the central government. At that time, because the opposition party had more seats than the ruling party in the National Assembly, which elected the president, the government tried to weaken the power of the National Assembly through local autonomy. For this reason, it might be said that the purpose of local autonomy of Korea differed from Western countries from the very beginning.

The Local Autonomy Act was amended twice in 1956. Since 4 years of local autonomy experience had revealed many irrationalities, such as an excessive number of assemblymen, no set number of meeting days, and frequent uncomfortable relations between the local assembly and the heads of local government, the second amendment was passed. Through this amendment, the heads of local government were to be directly elected by popular vote. Both the power of the "no-confidence" vote of assemblymen against the heads and the power of disbanding the local assembly of heads were abolished. In contrast to the substantial change in the second amendment, the third produced little change. For example, it preserved the 4-year term of the incumbent local heads and assemblymen elected in 1956. Many considered it as an instrument to postpone elections of local assemblymen until the presidential election of 1960.

Two years after the amendments of 1956, the Local Autonomy Act was substantially amended again. As local heads, a number of opposition party members controlled the local governments. The central government made an amendment that replaced direct election with an appointment system for local heads. The purpose of this amendment was to allow the central government under President Syngman Rhee to control local governments easily and effectively.

The Local Autonomy Act, revised four times during the First Republic period, was dramatically changed by the Second Republic, established by the student revolution on April 19, 1960. The Democratic Party government, which replaced President Rhee's Liberal Party, strengthened local autonomy. For instance, it reestablished the direct election system of local heads, including the mayor of Seoul, the governors of provinces, and even heads of the neighborhood associations such as Dong and Ri. It reintroduced the power of the no-confidence vote of the local assemblies against their heads. Throughout the entire nation, the third election of all heads and assemblymen was held in December 1960.

But the local government under the Second Republic was suddenly ended by the military coup of May 1961. The new military government, led by the late President Chung Hee Park, enacted the Provisional Act on Local Autonomy, which held the Local Autonomy Act in abeyance. According to this law, provinces, cities, and counties (Gun), including towns and townships, were eligible for self-governing units. (Only the last level of locality, called neighborhood associations such as Dong and Ri, were excluded from the self-governing units.) Actually, the law empowered the central government to dissolve local assemblies and to appoint the heads of local governments. The function of the provincial and Seoul assemblies was delegated to the Ministry of Home Affairs. Other city and county governments were placed under the provincial

governors appointed by minister of home affairs. According to the philosophy of efficiency by centralization, local self-governments have not existed since 1961.

However, the ninth Amendment of the constitution in 1987 rejuvenated local autonomy again with the 13th National Assembly elected on April 26, 1988. Based on that amendment, metropolitan and local assemblies were established in 1991, and both heads and assemblies were elected by the first nationwide local election in 1995. As of 2017, the seventh local governments, which were directly elected, work vigorously.

Until 2017, the Local Autonomy Act has also been amended 59 times including 2 total amendments, 35 partial amendments, and 22 related act amendments, and even today, it is still in the forefront of discussion. These frequent amendments to the Local Autonomy Act were not mostly made by the needs of the local residents but rather they were made for the various political purposes of the parties in power and the central government. Thus, local autonomy was distorted as a policy instrument to strengthen the centralization of the government rather than to decentralize the power.

## Current Situation of Local Autonomy

### Hierarchical Relationship Between Central and Local Governments

There are two kinds of administration levels in South Korea. The higher one is the autonomy level, and the lower one is the administrative level. Within the autonomy level, there are the metropolitan and local areas. There are cities, provinces, counties, and other administrative units such as town (Eup), township (Myun), and neighborhood associations (Dong), which are created by the central government only for the purpose of public service delivery (Fig. 1). (The first level of autonomy consists of a special city like Seoul, metropolitan city where several million population live, and province which include cities and rural areas. In addition, minimum number of population based on local level is different (metropolitan city 1,165,000, province 1,550,000, city 43,000, gun 10,000, as of 2018).)

The Ministry of Interior and Safety is one of the most powerful bureaucratic organizations in the central government. Of course, each ministry in the central government has the power to supervise in some ways and direct special subdivisions of the local governments within local ministry's jurisdiction.

There are two local governments related bureaus – local administration and decentralization, local finance and economy – in the Ministry of Interior and Safety. Each bureau administers handle local affairs under the guidance of the minister (Fig. 2). Furthermore, the power of appointment of deputy heads – province, cities, and counties – belongs to the Ministry of Interior and Safety. In reality, the local governments are half self-governing. They operate more like branch offices of the central government in some

**Innovations for Administrative Reforms in Korea Revisited: A Case of Local Autonomy, Fig. 1** Hierarchical structure of the central and local government (as of 2018). (Source: Ministry of the Interior and Safety, Statistical Yearbook 2019)

ways. Practically, almost half of local governments' work comes from the central government (see Table 5). In the light of this present hierarchical structure, the South Korean local government system may be called a half self-governing system. However, it could be argued that the present local autonomy will be improved gradually.

### Financial Self-Sufficiency of Local Governments

In 2018, the average level of financial self-sufficiency of local governments was only 53.4%, and the average rate of local revenue was only 23.3% of the national total (Tables 1 and 2). (Financial self-sufficiency means ratio of independent income such as local income tax against subsidies from the central government.) In comparison to Seoul and the other seven metropolitans' 65.7% of the self-sufficiency rate, 10 provinces' rate is only 39%, 75 cities' rate is only 37.9%, 83 counties' rate is only 18.5%, and 69 wards' rate is only 30.3% (Korea Research Institute for Local Administration 2018).

Among the 83 counties, the highest in terms of financial self-sufficiency was Dalsung-gun (45.97%) and the lowest was Kangjin-gun (11.39%). Of the 75 cities, the highest was Whasung (63.76%), and the lowest was Namwon (13.58%) as of 2016 (Ministry of Interior and Safety 2016). During the last 5 years, from 2014 to 2018, the financial self-sufficiency of the provinces, cities, and counties was not improved significantly. The average degree of financial self-sufficiency only changed from 51.9% to 53.4% during that period (Ministry of Interior and Safety 2018a, see Table 1).

In reality, local governments have financially depended on general and categorical assistance grants from the central government (see Table 2). It should be noted that nearly all local governments are financially weak and politically vulnerable to the influence of the central government.

Overcoming financial weakness and political vulnerability, local governments have been struggling to gain more income resources from the central government. As a result of these efforts, local governments entitled to collect cigarette sales tax, which is a part of local revenue, from 1984. After that local education tax was introduced, especially, local sales tax and local income tax, which is 10% of national sales and income tax each, were introduced in 2010. However, this amount of financial resource is still not sufficient for making local governments financially

independent. Therefore, the central government is considering an increase of tax revenues by providing local government with the power to autonomously appropriate the items and rate of taxation for local assemblies. For this reason, it seems that local financial self-sufficiency can be improved by reformation of structure and exploration of new sources for local taxation.

### Increase in Number of Local Public Officials

The local government organizations have been extended as a result of increasing trends in public service needs. This increase raised the need for local public employees. In addition, the workload of the local governments has been increased by the mandate system, which delegates additional matters to local agencies by the central government. As shown in Table 2, between 1965 and 2015, the number of local public service employees increased substantially by 632.5% (see Table 3). This also reveals that people want to receive more services through their local government because of convenient access and local relevance. Accordingly, central government needs to extend local government functions and to respond to local residents' demands.

## Affirmative Influences on Local Autonomy

In general, the failure of local autonomy in the 1950s was due to certain socioeconomic factors such as a low educator level, insufficient fiscal self-support capacity, narrow scope of governing of local affairs, and excessive control of central government. But these factors have been changing for the past half century. The education

level of the general public rapidly increased. Low financial self-sufficiency will be improved by reclassifying national tax revenue with local tax revenue. This shows that the central government is affirmatively changing its attitude toward local autonomy in response to the strong demand of the people. The following three factors constitute an affirmative influence on the reinstatement of local autonomy in South Korea.

### Education Level of the Public

The education level in South Korea has enhanced so rapidly that it cannot be compared adequately with any other case study example in the world. The percentage of school-age children attending school in 1950 was 69.8%, but in 2018 the percentage of elementary school children in school reached 97.4%. The percentage of secondary education students in the middle and high schools 97.9%, 92.4% each (Ministry of Education 2018). Even the ranking of OECD PISA is around 1–8 level among OECD countries. This shows the competence of Korean human capital. This rapid increase of the quantity and quality of education demonstrates the growth of the citizens' capability for and understanding of local self-government. Of course, high education level is not a necessary condition for operating a local self-governing system successfully, but it means that people will not experience the same failure of local autonomy caused by the 30% illiteracy rate in the 1950s.

### Central Governments' Attitude Toward Local Autonomy

It is no longer valid to say that due to the low fiscal self-capacity of the local government, local autonomy cannot succeed in South Korea. To support local autonomy, the central government changed the Local Tax Revenue Act in 1986, 2001, and 2010. According to these amendments, cigarette sales tax was allocated to local tax revenue, and local education tax, local sales tax, and local income tax were created. The central government is still considering various methods to strengthen local financial capacity. For example, the government is continuously trying to amend the Local Tax Share Act toward improving serious regional disparities. Within the national government, the Ministry of Economy and Finance is considering coordinating the rate of tax revenue shares. Also, the central government is giving consideration to raising the local sales and income tax rate to enhance the financial power for the local autonomy system.

However, the most important factor for the operation of local autonomy is the attitude of the central government, which gives discretionary power and autonomy to local governments without any intervention.

### Political Consciousness of the People

In 1960, when the third and last election period for local assemblies of self-governing communities was held, the per capita income was only $80. Many people say that local elections were fraught with corruption and injustice, including selling votes in order to earn money. But, as of 2018, per capita GDP has reached $32,800, as mentioned. With a rapid increase in income and material stability, the citizens have begun to express their desire for democracy and direct participation in central and local governmental affairs.

Furthermore, many maturity indicators of local politics such as turnout rate of local election, numbers of enactment and revision of local ordinance, and number of female assemblymen are enhancing continuously. The turnout rate of local election went up from 48.8% in 2002 to 56.8% in 2014. The numbers of enactment and revision of local ordinance increased from 31,481 in the first reinstate term of local assembly (1995~1998) to 44,331 in the fourth term (2006~2010). In addition, the number of female assemblymen grew from 4.0% in 1995 to 22.7% in 2014 (Table 4).

Moreover, the South Korean people have experienced the importance of participation through nationwide movements, such as the democratization movement in 1987 and 2016, which resulted in the peaceful replacement of the regime. We can say that the local autonomy system provides a lot of opportunity to participate in democracy.

## Enhancing Local Autonomy

Local autonomy entails decentralization, which means the distribution of concentrated power of the central government to local government.

**Innovations for Administrative Reforms in Korea Revisited: A Case of Local Autonomy, Table 4** Changes in political participation

| Item | 2002 | 2006 | 2010 | 2014 |
|---|---|---|---|---|
| Turnout rate (%) | 48.8 | 51.6 | 54.5 | 56.8 |
| Ratio of female assemblymen (%) | 4.0 | 14.5 | 19.7 | 22.7 |

Korea Research Institute for Local Administration (2015)

Therefore, in operating the local autonomy, one of the most important points is to set up an ideal relationship between central and local governments.

Compared with other countries, such as Japan, China, and some in Western Europe, South Korea has a very different tradition of local government. Those countries have a long history of local government concentrating and coordinating the dispersed power of local governments in the process of modern state building (Chung 1987). South Korea, on the other hand, is experiencing a reversal of this process. From this perspective, it is very difficult for Korea to make a desirable local autonomy system in a sense.

Numerous methods for restructuring the local governments in line with power decentralization have been suggested by both scholars and politicians. A better feasible system in this present sociopolitical context will be proposed in this section by considering the relationships between central and local governments, and the local governments' financial situations.

## Work Distribution Between Central and Local Government

The Local Autonomy Act provides that local autonomous bodies shall deal with local official matters and matters delegated to the entity by laws and ordinances. Therefore, government official work is allocated between central and local governments. The more work allocated to local governments, the more autonomy goes to them. At the same time, based on the burden of the work, power and responsibility can also be distributed.

At the moment, official works of local governments are divided by autonomous and delegated work. Delegated work means the work that is assigned to the local governments by the central government. This kind of task is basically allocated to the jurisdiction of the central government. Thus, the local governments carry out such work only as an agent without their own discretionary power. Delegated work falls into two categories: collective delegated work and agency delegated work. The central and the local governments have overlapping interest in collective delegated work. That is why the central government partially pays for the work execution by the local government. However, agency delegated work is the work that has no local self-interest, and the central government pays all for the work delegation. Now, the indigenous work of local governments only consists of half of their business. The agency delegated work and the collective delegated work consists of roughly 40% and 10% of the local work for each. The urban area has slightly more work and the rural area has slightly less (Lee et al. 2014, see Table 5).

**Innovations for Administrative Reforms in Korea Revisited: A Case of Local Autonomy, Table 5** Work distribution of local governments

| Autonomous Works (%) | Delegated Works (%) | |
|---|---|---|
| | Collective Delegated | Agency Delegated |
| 50~60 | 10 | 30~40 |

Source: Yoo and Lee (2015)

To enhance local autonomy, it needs to hand over more central work to the local level rather than just delegating its work. Accordingly, it is necessary to distribute as many functions as possible to the basic unit of local government such as city, county, and district. For establishing the tradition of grass-roots democracy, the national government has to limit intervention in local governments in the process of reinstating the local work system. At the same time, the financial base should go to the local based on the

redistribution of the works. In addition to this, work distribution should be simplified as central and local work rather than the three types of work as mentioned above.

### Improving the Local Financial System

The financial capacity of local governments is weak. In 2018, 41% of the total revenues for local governments came from outside sources in the form of subsidies of local share taxes provided by the central government (Ministry of Interior and Safety 2018b, c). Local governments still depend heavily on the subsidies from the central government to supplement their financial shortages (see Tables 1 and 2). The reason is that the present tax system puts more priority on national tax than on local tax. The total tax revenue of South Korea was comprised of 76.7% national tax and 23.3% local tax in 2017 (Ministry of Interior and Safety 2017). Therefore, it is necessary that some of the national tax items provide for the sufficiency of local self-governments.

But the most important thing is not to levy any new local tax on local people in order to reinstate local autonomy. Rather than new local taxes, a strategy for developing the local economy should be considered by inviting manufacturing companies to boost the local economy. Each local government should also establish a long-term financial planning system. In addition, scientific management tools such as computer analysis, organization methods, and management information systems should be modernized for local self-governments to enhance efficiency and the economy.

## Conclusion

The structure and governance of local governments was frequently changed throughout the 9-year period 1952 to 1961 and was even suspended. But the institutions for the local autonomy was partially reinstated in 1991 and then fully reinstated in 1995. Especially, since 1991, several important direct participatory institutions such as residents bill proposals, elected official recalls, resident action suits, and calls for an audit system were introduced to the local government (Yoo and Lee 2015). To invigorate and innovate local self-government, the central government will have to take proper actions on the following three points.

1. Without any intervention and control, the central government and other concerned authorities should distribute their power to local self-governments in order to maintain autonomy.
2. The central government should accelerate a balanced regional development policy in order to activate local economies and to result in balanced growth among the regions. Relocating more private and public institutions to the provincial areas would be possible way to reinforce the local power in and out of economy and politics.
3. The central government should encourage participation in local politics and give much more related information to them through public relations activities. The most advanced information and computer technology (ICT) of Korea makes it much more easily possible.

It is more important to keep in mind that the operation of local autonomy does not depend on the system but on the people who operate the system. This is a key reason and impetus to recruit and maintain competent local manpower. Accordingly, those who are influential in the operation of local autonomy have to show their strong willingness toward a more advanced and democratic local government system.

## Endnotes

1. There had been military regime since 1961 in Korea. However, due to the economic prosperity and maturity of citizenship during 1980s, the people realize the meaning of democratization which makes the people advocate their civil right.
2. Even though the central government wants to implement some land development policy for some local areas, it frequently failed. Because

it did not exactly know about the specific environment and sentiments of the local communities.
3. Even though the assemblies were constituted, the heads of the local governments were appointed by the central government for a while.
4. Only the last level of locality, called neighborhood associations such as Dong and Ri, were excluded from the self-governing units.
5. The first level of autonomy consists of special city like Seoul, metropolitan city where several million population live, and province which include cities and rural areas. In addition, minimum number of population based on local level is different (metropolitan city 1,165,000, province 1,550,000, city 43,000, gun 10,000, as of 2018).
6. Financial self-sufficiency means ratio of independent income such as local income tax against subsidies from the central government.
7. This is due to the growth of the people's needs for the public services such as welfare benefits, and central government driven economic development.
8. Local autonomy system provides the residents several important participatory opportunities such as recalling their heads, offering ordinance, and partially making local budget. It is like a grassroots politics education.
9. Delegated works consists of group such as farmyard development, and agency delegated such as issuing personal passports.

# Innovations in Administrative Reforms

Frank L. K. Ohemeng
Department of Public Administration, College of Law, Commerce and Public Affairs, Incheon National University, Yeonsu-gu, Incheon, South Korea

## Synonyms

Improvements; Invention; Modernism; Modernization; Novelty; Revolution

## Definition

Innovation in administrative reform is a dynamic process that changes the overall architecture of government, identifies issues and challenges, develops new processes, and creates, selects, and implements new solutions.

The intentional introduction and application within a role, group, or organization of ideas, processes, products or procedures, new to the relevant unit of adoption, designed to significantly benefit the individual, the group organization, or wider society.

## Introduction: Innovation in the Public Sector

Innovation has become the industrial religion of the late twentieth century in both the public and private sectors. For example, business sees it as

the key to increasing profits and market share through the development of new products and new ways of delivering services to customers, while governments see it as the way to fix the economy, especially service delivery. In the public sector, it has become a buzzword among politicians, policy makers, and others in the context of "improving" the "public sector," or making it more effective and efficient.

Governments around the world continue to advance innovation as a significant means to improve public services. The article goes on to say that the rhetoric of innovation has replaced the postwar language of welfare economics. It is the new theology that unites the political left and right. Over the past three decades, the idea of innovation in services has grown in importance more rapidly than in the decades before.

In the public sector, innovation has mostly concentrated on developing ways to make the administrative state responsive to the needs of citizens. The focus is more on administrative reform, or what the literature generally refers to as public sector or public organizational reforms. Innovation in administrative reform has targeted efficiency in service delivery rather than effectiveness, on the premise that one will cause the other.

The current discussion of innovation in administrative reforms was instigated by the emergence of the New Public Management, a technique introduced by the far right in the early 1980s to streamline the public sector. The intention was to enable it to emulate, if not imitate, the private sector. Since then the idea has been supplemented with the adoption of information communication technologies, culminating in electronic government, mobile government, etc., and the new public governance, meaning government engaging or collaborating with different sectors for better public services. Meeting these objectives also means the development of new organizational structures for the state bureaucracy, which was seen as stifling innovation. Consequently, the new modes of reforming the bureaucracy continue to be adopted with a view to meeting citizens' expectations for public service while reducing taxation. At the same time, innovation in administrative reforms is expected to yield fresh ideas about how the public sector should look in terms of structure, as well as how it can use this structure to develop an environment that will enhance performance outside the public sector. Innovation in administration can thus be seen as comprising "deliberate changes to the structures and processes of public sector organizations with the objective of getting them to run better" (Pollitt and Bouckaert 2004: 8).

## Innovation in Administrative Reforms

A vast array of types of innovation is identified in the literature. A caveat, though, is that all of them can be applied in administrative reforms in one way or another. Here we will review the common ones. In their study of public sector innovation, Osborne and Brown (2013) identified four modes of change to products and services – three innovative and one developmental. The first is radical innovation, meaning "processes of reorientation wherein patterns of consistency are fundamentally reordered" (Tushman and Romanelli 1985: 176). Omachonu and Einspruch (2010) have described this as consisting of disruptive innovations, and as revolutionary, transformational, or nonlinear, creating disorder for old systems, creating new players and new markets while marginalizing old ones, and delivering dramatic value to stakeholders who successfully implement and adapt to the innovation (4). According to Engen and Holen (2014), the common feature of radical innovation is "the effect of the change on the resources or technology in the organization" (16). Radical innovations thus prompt "significant subsequent technological development and exhibit novelty and 'architectural' innovation, *i.e.* rearranging the way design elements are put together in a system" (Kasmire et al. 2012: 346). This type of innovation is therefore very profound and disturbs the equilibrium of the organization immediately as well as into the future.

The second element identified by Osborne and Brown is architectural innovation. Architectural innovation is a innovation that "change[s] the way in which the components of a product are linked together, while leaving the core design concepts (and thus the basic knowledge underlying the components) untouched" (Henderson and Clark

1990: 10). It involves the "rearranging [of] known parts (components) into new patterns (architectures) to achieve higher levels of system performance on one or more dimensions" (Baldwin and Clark 2006: 4), or exploring new possibilities in product design and development through proactively assimilating new technical knowledge by working closely with stakeholders.

The third type of innovation is incremental. According to Globerman and Lybecker (2014), incremental innovations encompass relatively modest improvements to existing products and production processes. Henderson and Clark (1990) say that incremental innovation reinforces the capabilities of established organizations. Osborne and Brown (2013) believe that the term incremental innovation may be misleading in the sense that "such innovation still involves discontinuous change to products or services, although it takes place within the existing production paradigm and affects either organisational skills and competencies or the market/needs that the innovation is addressing" (5). The fourth type of change is product or service development or modular innovation, which is considered to be "innovation that changes a product's architecture but leaves the components, and the core design concepts that they embody, unchanged" (Henderson and Clark 1990: 12). This type of innovation thus "constitutes the repackaging or change in the design of a particular technology or product to reach new markets" (Julnes 2016: 30).

Other scholars have looked at innovation from the perspective of product, process, marketing, and organizational innovations. A product innovation, according to the OECD (2005), is the "introduction of a good or service that is new or significantly improved with respect to its characteristics or intended uses, and it includes significant improvements in technical specifications, components and materials, incorporated software, user friendliness or other functional characteristics"(11). In the public sector, it is about what service is delivered. A good example is the delivery of public services online rather than the traditional way. Product innovations are easy to identify, as they involve the creation and launch of new goods and services.

On the other hand, process innovation is the "implementation of a method for the production and provision of services and goods that is new or significantly improved compared to existing processes in your organisation" (Bloch and Bugge 2013: 145). It deals with improvements in the production or delivery of a product or service, and with changes in techniques, equipment, or software. This type of innovation is characterized by changes in the way a service is carried out or delivered, which – since it does not require significant changes in organizational structure – would seemingly be easier to implement. It thus comprises new or significantly improved methods in the production or manufacturing process. It is more internally than externally driven innovation. Process innovations are thus often silent and hidden from public view, as they involve changes in operations, tasks, and ways of working, and not, necessarily, in the product.

The OECD (2005) sees marketing innovation as the "implementation of a new marketing method involving significant changes in product design or packaging, product placement, product promotion or pricing" (49). Robinson and Pearce (1988) consider it as innovation in marketing or as consisting of new marketing techniques in the context of strategic organizational behavior and patterns. In marketing innovation, the focus is on "the generation and implementation of new ideas for creating, communicating, and delivering value to customers and managing customer relationships in ways that benefit the organisation" (Tinoco 2010: 5). Finally, organizational innovation is about new ways of organizing work to encourage and promote competitive advantage; it can be a new product, service, technology, or administrative practice (Hage 1999: 597). It is more about adopting or creating an idea or behavior that is new to the organization, and includes the espousal of new management systems, new methods of organizing work responsibilities and decision making, new ways of organizing external relations, and new systems for gathering knowledge and building innovative capacity. It thus fundamentally concerns the "art of doing things in a better way than before. . . so [that] organizational innovation can be interpreted as an

improved way of undertaking given tasks" (Valkama et al. 2013: 28).

Halvorsen et al. (2005) have also identified administrative innovation involving new policy instruments, particularly in service provision or, even, organizational structural changes; fundamental system innovations, including new organizations or new patterns of cooperation and interaction; and conceptual innovations, changing the outlook of actors. To them, such changes are accompanied by new concepts, and radical changes in rationale, or shifts in the worldview of employees.

## Characteristics of Innovation in Administrative Reforms

In their study of innovation in health service delivery, Omachonu and Einspruch (2010) identified three important characteristics of innovation: novelty, an application component, and an intended benefit. Novelty refers to the notion that what is being introduced must either be entirely new or a significant improvement. Daglio et al. (2015) say that novelty is subjective, so that while an innovation may be new for the organization where it is implemented, it may already be in use elsewhere. In short, it deals with new ways of thinking or service, new products, or, perhaps, new procedures.

Second is an application component, going beyond the ideas themselves. In this case, it is more about where the innovation will be applied, or simply the diffusion of the ideas to new settings. Lynn (2013) believes that innovation can be "old wine in new a bottle" (32). Something becomes innovative as a result of where it is being applied; the idea is not necessarily new, and might have been applied elsewhere.

The third is intended benefit, meaning the benefit that is supposed to be derived from the innovation, and that thus "distinguishes it [the innovation] from serendipitous change or deliberate change" (West and Altink 1996: 5). In administrative reforms, the intended benefit can be within the organization or outside it. Within it, the new ideas may change how things are done for the benefit of the members: for example, new technologies may help members improve their performance. Externally, the benefit can be in how citizens receive services, or may simply be in the creation of meaningful and trustworthy interaction with the larger society.

## Essence of Innovation in Administrative Reforms

Here we will examine three areas in which innovation in administrative reform has recently become important. First, it is essentially to help bring about new and improved structures and ideas that can enhance economic development from the perspective of the government or in the role of government, in the development of the national economy. It is assumed that "innovation is the main driver of economic change [*and through such*] innovation the necessary conditions for creating a competitive economy that will have a positive influence on environmental and social renewal" will be developed (Bekkers et al. 2011: 3). This is more true in an era of knowledge economies. Creating such conditions, however, depends on the effectiveness of public sector institutions, because of the continuing importance of the public sector in determining the kind of environment that will enable the private sector to properly function.

Second, in an era of public governance, with increased emphasis on creating value with citizen participation through networks, administrative reform innovation helps to keep citizen participation at the forefront of policy development and implementation. As noted by Bekkers et al. (2011: 11), "the innovation agenda that is based on the idea of governance tries to set the conditions under which cooperation between different public, semi-public, and private sectors can become successful, as well as to develop all kinds of network-like arrangements that are required in order to pick up all kinds of 'wicked policy problems'."

Administrative reform innovation is also expected to promote new values and norms in the public bureaucracy. Individuals in

organizations are shaped by a variety of values and norms, absorbed from home, school, and different workplaces. Innovative ideas help to change such orientations so that these individuals can adjust to their new settings. For instance, the innovation may concentrate on creating a new culture or new professional or ethical values by which organizational members have to abide, imposed by a new ideology or new structures. Those new values may further help or influence members to be innovative in their work performance. New values can promote a creative mindset that encourages public sector efficiency and delivers high quality, competitive public services.

## Conclusion

Innovation has become a buzzword in both the public and private sectors. In the former, it has manifested itself in what the literature generally calls public sector reforms or administrative reforms. In administrative reform, innovation means "creative destruction" of the old ways of doing things and the development of new methods, to improve public organizations' performance. That performance may be a matter of how they directly deal with clients or how they create value to a network of stakeholders.

Innovation in administrative reforms is unending. It is a continuing attempt to improve organizations, as well as to infuse them with new ideas. It can take many different forms. Administrative reformers must therefore continue to display vision and leadership to help public organizations with new ideas that can be readily developed and implemented for better organizational performance. Such ideas can come from within or outside the organization. By doing this, the reformers may mitigate the sustained criticisms of the administration as unresponsive to the needs of citizens.

## Synonyms

Achievements; Budgetary; Hostile; Organizations/setup; State; System

## Definitions

- **Institutional arrangements**: It refers to organizational setup/shape/design of various public institutions such as democracy, governance, politics, law and order, economy, etc., in a welfare characterized state.
- **Fiscal performance**: It refers to the budgetary stability of a state. In other words, it means the efficient allocation of funds without creating any pressure on the state economy.
- **Conflict region**: It refers to a state engulfed with political or social turmoil.

## Introduction

The determinants of government expenditure have attained a multidimensional approach. The factors which determine the growth of government expenditure have not remained confined to one particular sector but have varied to different institutions and activities. The literature suggests that the growth of government expenditure is affected by various institutional factors related to the economic, political, demographic, and infrastructural viewpoint. Tanzi and Schuknecht (1997) and Hassan and Mishra (2017) measure determinants of government expenditure by linking government expenditure to socioeconomic institutions such as income level, education, and healthcare that are assumed to be targeted by public spendings. However a number of studies have linked growth of government expenditure to several other institutional factors including fiscal structure (Remmer 2004), administrative process (Bräuninger, 2005), and government proficiency of public good provisioning (Rogoff 1990).

The influence of political institutions on government spending has attracted numerous studies over the last decade. The type of political ruling, political stability, political ideology, and election cycle has been considered the major factors which influence the growth of aggregate and different categories of government expenditure (Persson et al. 2007). Velasco (2000) shows that the larger the size of the legislature, the higher the public expenditures in OECD countries. Perotti and Kontopoulos (2002) analyze the public expenditure through political fragmentation, measured by the number of parties in a coalition, the number of spending ministers, or the number of representatives. Schuknecht (2002) argued that preelection expenditures give out a gesture of the incumbent's ability to supply more public goods. Further, the incumbents would spend more on those items that the voters observe, just to maximize their reelection possibility. Dash and Raja (2013) identified that political institution such as government fragmentation, the potency of the opposition, the majority of the government, and the ideology of the

government and electoral cycle affects the magnitude of government spending.

Therefore, it is obvious from the above discussion that the determinants of government spending are multidimensional. It is not only the income or economic institutions which raise expenditure but other institutional factors also influence the growth of government spending. Thus whether these institutions or any other institution can be held accountable for the rise and fall of government expenditure in a conflict region such as the state of Jammu and Kashmir has become an empirical question. We are intending to the understanding of the impact of economic and political institutions prevailing in the state of Jammu and Kashmir, on the aggregate government spending. An economic and political institution has been chosen due to the fact that they constitute a major and important part of fiscal policymaking. The study is important in the sense that no effort has been done so far to examine the institutions responsible the growth of government spending in the conflict state such as Jammu and Kashmir. The rest of the paper has been divided into four sections. Section I will deal with background, objectives, and sources of data. Section II will highlight the methodology and estimation procedure, and Section III will discuss the results of the models and followed by a conclusion.

## Background of the Study

Jammu and Kashmir is the northern state of India known as crown of India because it situated in the extreme north. The present-day political condition in Jammu and Kashmir is well implicit by the electoral politics of the state since the assembly elections of 1983. The Jammu and Kashmir politics is spread over three phases. The first phase between 1983 and 1987 is the period locale the base for hostility, political upsurge, and militancy. The second phase between l987 and 1996 is the period of political crisis. The third phase between 1996 and 2002 is the period of reinstatement of the political process (Chowdhary and Rao 2003). The political system of Jammu and Kashmir starts in 1953 with one-party dominance, i.e., National Conference, and before the year 1953, it was a princely state run by Dogra Empire. In the year 1983, another political party came into existence known as Jamat-i-Islami which fought the election of 1984 and brought to motion an era of political unrest. In the year 2002, the dominant political party of Jammu and Kashmir, i.e., National Conference, lost the election, and it paved the way for new political institutions, a coalition politics in the state. We believe that the emergence of a coalition government with multi-political ideological leanings resulted in weak governance and adversely affected the policies of taxation and public expenditure in the state.

On the other hand, the financial condition of Jammu and Kashmir State over the last three decades has been a source of deep concern. Over the years, the fused fiscal position of the state has revealed a noticeable deterioration in some of their major fiscal indicators. One of the primary weaknesses of state government finance can be credited to the increases in nondevelopmental expenditure, mainly the revenue component of the nondevelopmental expenditure, and interest payments as a share of revenue receipts. The multidimensional problems of the state's fiscal scenario consist of structural imbalances in the form of revenue and capital deficit in particular and large budget deficit in general, resulting in rising interest burden, increasing distortions in the pattern of expenditure, and very slow-growing nontax revenues. These problems, over the years, have been further accentuated by several economic and political institutional upheavals in the state.

Government spending has increased tremendously in the state over the last three decades. In welfare characterized state, the quantum of public spending has not only increased tremendously but also has reached fantastic heights. Explosive public expenditure in Jammu and Kashmir in recent years most probably has not given enough momentum to the growth of the economy due to several leakages rather it has helped the state in extending the various

unproductive tasks. Though noteworthy development has taken place in some areas since independence, access to opportunities for a reasonable minimum standard of living is one of the lowest in the country.

The total government spending of the state has grown to nine times between "1990–1991 and 2012–2013" with an average annual growth rate of 60.1 percent. The tremendous increase in public expenditure in the first phase might have been due to increased public expenditure on general services for containing law and order, organs of state, and the increasing demand for social services such as education and health. Secondly, the tremendous increase in public spending might be due to the growth of GDP, per capita income, the growth of population, urbanization, and other social and economic factors. There is also a vast change in the public expenditure in general services, economic services, and social services in Jammu and Kashmir. The expenditure on general services has increased 43 percent during 2006–2007 to 2009–2010 and 68 percent during 2009–2010 to 2012–2013. The average growth rate of general expenditure is 10.2 percent annually. The expenditure on general services has always remained high in the state which most probably might have been due to political conditions, rate of unemployment, security purpose, growing population, etc. While the expenditure on social services has increased by 48 percent between 2006–2007 and 2009–2010 and by 44 percent between 2009–2010 and 2012–2013, the average annual rate of growth of social service expenditure stands at 8.2 percent during the same period. The public expenditure on economic services grew by 45 percent during 2006–2007 to 2009–2010 and 17 percent during 2009–2010 to 2012–2013 with an average annual growth rate of 11 percent.

All the above-noted trends provide a solid ground for the necessity and the desirability of undertaking an analysis of the determinants of government expenditure of the state of Jammu and Kashmir to have a proper understanding of the institutions which have been responsible for pushing the level of government spending to such fantastic heights. We believe that many economic and political institutional variables affect fiscal outcomes. Further, even with the emergence and growth of public choice as a new perspective from which to examine the operations of governments, the consensus view asserted by Dye (1984) remained at least an implicit assumption of efforts to identify determinants of government expenditures.

Keeping in mind the trend and pattern of government spending, the primary objectives of this study here is to examine all of the pieces of the fiscal decision-making environment together, and therefore the main objectives of this paper are to:

I) To analyze the impact of economic institutions on government spending of Jammu and Kashmir
II) To examine the tendency of short-term adjustment of economic institutions to stable the long-term equilibrium in government expenditure.
III) To investigate the role of political institutions in determining the government spending in Jammu and Kashmir

## Hypotheses

1. Absolute levels of government spending are largely determined by social and economic institutions.
2. Changes in political institutional variables might have a larger impact on the level of government spending.

## Sources of Data

The study is primarily based on the time series data using the time period of 32 years from 1984–1985 to 2015–2016. The specification of this time period is that the entire period has witnessed wide economic ups and downs where the economic activities in the state have reduced widely. The further entire period has witnessed a

drastic political instability and social unrest leading a big change in revenue generating a capacity of the state. The major sources of data for the study are annual budget papers of the Jammu and Kashmir state, state finance reports Reserve Bank of India, and Economic Surveys of J&K, census reports, and NSSO rounds. The data related to political institutions have been collected from election commission of India, State legislative assembly, and Home ministry and South Asian Terrorism Portal.

## Methodology

The econometric framework adopted in this paper is based on developments in co-integration and error correction model suggested by Johansen (1988) and Johansen and Jusellious (1995). By applying VECM techniques to the time series data, based on the results of unit root and multivariate co-integration test, we are able to approximate a dynamic structure in which initially all the variables in both the models are treated as endogenous. Most time series analysis demonstrates nonstationary characteristic in their mean or trending pattern. Therefore, in order to determine the suitable method of time series econometric analysis, a common approach is to identify the form of the trend in the data and whether individual data series contain unit root characteristic. If the data is trending, then some form of de-trending is needed. The most common de-trending practices are differencing and time-trend regressions. Thus, the first step in co-integration modeling is often taken by testing for unit roots to determine whether trending data should be differenced or regressed on deterministic functions of time.

After employing unit root and co-integration modeling for the time series data set of each determinant function, we are able to constitute a model free of spurious properties and having dynamic robustness structure. Based on the unit root and co-integration results, we identify the error correction models which are suitable to generate robust results in terms of demographic and infrastructure determinants of government expenditure. As stated above, this study employs Johansen multivariate co-integration approach developed by Johansen (1988) and Johansen and Jusellious (1995), specified as a reduced-form VAR model of order $p$. Therefore, in this study, the ECM model is used to assess the short- and long-run determinants of government expenditure through infrastructure variables in the state of Jammu and Kashmir. Therefore, the basic model specified for all the three studies is as

$$y_t = A_1 y_{t-1} + \ldots + A_i y_{t-i} + \ldots + A_p y_{t-p} + Bx_t + e_t \quad (1)$$

where:

$y_t$ is the vector of endogenous variables (i.e., government expenditure)
$x_t$ is the vector of deterministic variables (demographic and infrastructure variables)
$A_i$ and $B$ are matrices of coefficients of the variables to be estimated
$e_t$ is a residual *vector*
$i$ is the lag length, $p$ is the maximum lag length, and $t$ is the time period

The above equation (1) states that the procedure by which the dependent variables in $y_t$ vary about their time-invariant means is entirely determined by the parameters in $A_i$ and $B$, and the (infinite) past history of $y_t$ itself, the exogenous variables $x_t$, and the history of independently and identically distributed shocks, $e_{t-1}, e_{t-2}, \ldots$. Therefore, the joint distribution of $y_t$ is determined by the distributions of $x_t$ and $e_t$ and the parameters $B$ and $A_i$.

However, according to the Granger representation theorem (Granger 1988), if co-integration is established among a vector of variables in the model, then a valid error correction model may be estimated; if not, then VAR is used. Therefore, in this study, the choice of whether to use VAR or VECM for estimations follows Granger representation theorem; that is, it is based on co-integration results.

**Dependent variable**: Total government spending
**Independent variables**
**Political institution variables**: Political fragmentation, law and order, and election cycle
*Political fragmentation* means the number of parties in ruling government coalition. In analyzing political fragmentation, dummy variables will be used in which 0 values will be given to single party (majoritarian government), 1 for 1/2 collation, and so on.
*Election cycle* means the year of the election. The dummy variables used here were 1 for the election year and 0 for other years.
Law and order implies the situation of violence and strikes in the state. The variable is proxy for the unrest and political turmoil. Dummy form has been used in which 0 is given to financial year when there was less than five hundred civilian killings and 1 when there were more than five hundred civilian killings in the state in particular financial year.
**Economic institution variables**: GSDP, tax revenue, unemployment rate, grant-in-aid, and fiscal deficit

## Estimation Procedure

Nonstationary data leads to spurious regression due to nonconstant mean and variance (Dimitrova 2005). If a series is stationary without any differencing, it is said to be I(0) or integrated of order 0. However, if a series is stationary after first difference is said to be I (1) or integrated of order 1. To this end, the Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) tests have been adopted to examine the stationary, or otherwise, of the time series data. The lowest value of Akaike information criterion (AIC) has been used in this to decide the optimal lag length in the ADF and PP regression. These lags were used in ADF and PP regression to make sure that the error term is white noise. If all the variables in an equation are in integral order of I(1) and the resulting residuals are I(0), then according to Engle and Granger (1988), it can be declared that there resides a corresponding error correction mechanism (ECM or *et-1*), and the basic models will be transformed accordingly. The regression from ADF test is of the following the form:

$$\Delta y_t = \alpha_0 + \alpha_1 y_{t-1} + \sum_{j=1}^{p} \gamma_j \Delta y_{t-j} + \varepsilon_t \qquad (2)$$

where $\Delta$ is the first-difference operator, $y_t$ is the respective variable of expenditure over time, $p$ is lag, $\alpha_0$ is constant, $\alpha_1$and $\gamma_j$ are parameters, and $\varepsilon_t$ denotes stochastic error term.

If $\alpha_1 = 0$, then the series is said to have a unit root and is nonstationary. Hence, if the hypothesis, $\alpha_1 = 0$, is not accepted according to equation, it can be concluded that the time series does not have a unit root and is integrated of order I(0), or in other words it has stationarity properties.

Similarly, the regression from Phillips-Perron (PP) test is in the following the form:

$$y_t = \alpha_0 + \alpha_1 y_{t-1} + \alpha_2 (t - T/2) + \mu_t \qquad (3)$$

where $\alpha_0$, $\alpha_1$, $\alpha_2$ are the expected least squares regression coefficients, the hypotheses of stationarity to be tested are $H0 : \alpha_0 = 1$ and $H0 : \alpha_1 = 1, H0 : \alpha_2 = 0$.

## Co-integration Test

After analyzing whether the series is stationary in levels or first difference or integrated in the same order, then Johansen's co-integration method is used to verify whether there exists a co-integrating vector among the variables or not (Johansen, 1988). The Johansen's co-integration test employs two test statistics to identify the number of co-integrating vectors which are the Trace test and the Maximum Eigenvalue test. The Trace statistics tests the null hypothesis of $r$ co-integrating vectors/equation in the given series against the alternative hypothesis of no co-integrating equations. The Trace statistics test is calculated by using the following expression:

$$LR_{tr}\left(\frac{r}{n}\right) = -T * \sum_{i=r+1}^{n} \log\left(1 - \check{Y}_1\right)$$

where $\check{Y}$ is the Trace statistics value, $n$ is the number of variables in the system, and $r = 0, 1, 2, \ldots, n - 1$ co-integrating equations.

Similarly, the null hypothesis for the Max Eigenvalue is to test r co-integrating equations against the alternative of r + 1 co-integrating equations where $r = 0, 1, 2, \ldots, n - 1$ and n is the number of variables in the system. The test statistic for Max Eigenvalue is computed as

$$LR_{\max}\left({}^{r}\!/_{n+1}\right) = -T * \log\left(1 - \check{Y}\right)$$

where $\check{Y}$ is the Max Eigenvalue and T is the sample size.

In case Max Eigenvalue statistics and the Trace statistics yield different results, then Trace statistics test will be preferred.

## Model Specification

After the Johansen co-integration test, next is to fit the suitable time series model. If co-integration has been establishing between the variables, and then this implies that there exists a long-run relationship between the variables under integration equation. Hence, the VECM is applied in order to determine the short-run relationships of co-integrated variables. On the other hand, if there exists no co-integration, then the VECM is transformed to Vector autoregressive (VAR) model, followed by impulse analysis, variance decomposition, and the Granger causality tests to determine casual links and response of dependent variable toward independent variable with a period of stability.

The specification of VECM model for economic determents of government expenditure is given below. The model equations are formed in such way to avoid multicollinearity issue according to the basic form of the relationship shown above. (The standard form of equations given below is after Johansen co-integration test). It was found that economic variables are co-integrated; therefore, the model is as follows.

## ECM Models for Economic Determinants

$$\begin{aligned}\Delta\mathbf{govtexp}_t = {} & \alpha_1 + \prod\nolimits_1 e_{t-1} \\ & + \sum_{i=0}^{n} \beta_1 \Delta\mathbf{govtexp}_{t-i} + \sum_{i=0}^{n} \beta_2 \Delta nsdp_{t-i} \\ & + \sum_{i=0}^{n} \beta_3 \mathbf{taxrev}_{t-i} + \sum_{i=0}^{n} \beta_4 \Delta\mathbf{grants}_{t-i} \\ & + \sum_{i=0}^{n} \beta_5 \Delta\mathbf{unemp}_{t-i}\end{aligned} \tag{4}$$

$$\begin{aligned}\Delta\mathbf{govtexp}_t = {} & \alpha_2 + \prod\nolimits_2 e_{t-1} \\ & + \sum_{i=0}^{n} \gamma_1 \Delta\mathbf{govtexp}_{t-i} + \sum_{i=0}^{n} \gamma_2 \Delta gfd_{t-i} \\ & + \sum_{i=0}^{n} \gamma_3 \Delta pci_{t-i}\end{aligned} \tag{5}$$

In the above two VECM models, the co-integration rank shows the number of co-integrating vectors. For example, the rank of four indicates that four linearly independent combinations of the nonstationary variables will be stationary. $\beta_1$, $\beta_2$, $\beta_3$, $\beta_4$, $\beta_5$ and $\gamma_1$, $\gamma_2$, $\gamma_3$ are the coefficients of the respective variables in ECM equations 1 and 3. Also $\alpha_1$, $\alpha_2$ are constant coefficient. $\prod_1 e_{t-1}$ represents the error correction term (ECT) in both equations. A negative and significant coefficient of the ECT shows the speed of adjustment of short-run variables toward long run, or in other words it shows how far any short-run fluctuation between the independent variables and dependent variables will give rise to stable long-run equilibrium between the variables.

## Regression Model for Political Determinants

The dummy nature of the political variables has restricted to use VECM model because variables are not having a stationary issue; thus there will be no problem of spurious regression which may affect the significance of the variables. Thus multiple regression models are the best fit for the

political variables. The regression model used to identify the impact is given below.

$$\boldsymbol{\Delta}\mathbf{govtexp}_t = \boldsymbol{\alpha}_3 + \boldsymbol{\Delta}\mathbf{govtexp}_t + \boldsymbol{\delta}_1(\mathbf{polfreg})_t + \boldsymbol{\delta}_2(\mathbf{lawnorder})_t + \boldsymbol{\delta}_3(\mathbf{elecy})_t + \boldsymbol{\varepsilon}_t \quad (6)$$

where Δ is the difference level of the variable $\alpha_3$ the long-run coefficients of the equation. However, if the series are not co-integrated, there will be no long-run coefficient. $\boldsymbol{\varepsilon}_t$ is the error coefficient term of the long-term relationship of the variables. Also $\boldsymbol{\delta}_1$, $\boldsymbol{\delta}_2$, $\boldsymbol{\delta}_3$ are the coefficients of the respective variables of regression equation 4. The hypothesis of both the equations is tested on probability value of t-statistics at 5% and 10% level of significance.

## Diagnostic Tests

Different diagnostic tests have been carried out in order to check the strength of our models estimated. The diagnostic tests applied in the restricted equations are the Breusch-Godfrey serial correlation or LM test done for serial correlation of the model and the ARCH test (autoregressive conditional heteroskedasticity) that has been carried for heteroskedasticity. Similarly, the test for parameter stability of the model has been performed by the CUSUM statistics, and the normality test has been done through the Jarque-Bera test. All the diagnostic tests are estimated through null hypothesis which is tested through the test statistic value of each test at the probability value at 5% level of significance.

## Results and Discussion

The empirical scrutiny begins with the lag creation. Akaike's information criterion (AIC) has been used to find out the lag order of each institutional variable under study.

### Unit Root Test

The Augmented Dickey-Fuller (ADF) test and Phillips-Perron (PP) tests were conducted to pre-test the variables for unit roots to verify that the variables are not integrated of an order higher than one. Table 1 provides the cumulative distribution of ADF and PP test.

The estimated results of ADF and PP test in Table 1 shows that all variables are found to be nonstationary at levels but are stationary after first differencing. It implies that the variables like Govtexp, NSDP, Taxrev, Unemp, Grants, GDF, and PCI are integrated of order one which further implies that the variables are having I (1) integrating order. Therefore, the unit root test has predicted a trend in the time series variables at the level and after first difference; the trend has been removed from the variables so that the regression model would not be biased. We then proceed to analyze the results of the multivariate co-integration analysis.

### Co-integration Test for Economic Determinants Series

In order to avoid the problem of multicollinearity, we have divided the economic variables into two series for co-integration analysis and also for the models. In series 1 the variables used are Govtexp, NSDP, Taxrev, Unemp, and Grants, while in series 2 Govtexp, GFD and PCI have been used. We can also identify these variables according to the equations/models used above. The results of both the series are shown in Tables 2 and 3.

The results of both co-integrated series of economic variables suggest that the variables in both the series are co-integrated which implies that all the economic variables have a long-run relationship with government expenditure. As it is evident that the Trace test indicates two co-integrating equations in both the series as the null hypothesis of r = 0 is rejected. Further, Max Eigen statistics indicates three co-integrating equation in series I and no co-integrating equation in series II. As the results between Trace statistics and Max Eigen statistics differ, we will choose Trace statistics value. Therefore from the above co-integration results of equations 1 and 3 of the models, it

may be concluded that there is a unique long-run equilibrium relationship between economic variables and government expenditure. Therefore, these findings indicate that the appropriate model to fit in the data for economic variables of both of the series (i.e., equations 1 and 3 from the models discussed) is VECM.

## Impact of Economic Institution on Government Spending

The existence of co-integration among variables of economic institution suggests that the variables have a long-run relationship; hence the VECM is suitable for modeling the relationship between government expenditure and economic variables like NSDP, Taxrev, Grants, Unemp, GFD, and PCI. Further, the VECM also reports the short-run relationship among variables and depicts how they adjust toward long-run equilibrium. As pointed out in the preceding paragraphs, the existence of multicollinearity issue forced us to divide economic variables into two co-integrated series; thus VECM has been used in both the equations. Table 4 shows the long- and the short-run relationship of economic variables toward government expenditure.

The estimated results of both the models highlighting the economic determinants of government expenditure carry with them some important policy implications. The results of equation 1 show that the respective variables have a long-run relationship with the government expenditure. The estimated coefficients of the long-run relationship of equation 1 show that NSDP of the state has a positive and significant impact on the growth of government expenditure over the long run and the results are in line with Bergh and Henrekson (2011). It implies that 1% increase in NSDP of the state will lead to increase government expenditure by 1.8% which was unexpected. It might be due factor that with continued growth in economic activities and growth in overall economic infrastructure in the state over long period of time, the income of the people increase which in return increase the state income and thus induce government to spend more on the pending activities which were left behind due to shortage of funds. These results coincide with the state of Jammu and Kashmir because due to a shortage of funds most of the demands of the people like health, education, electricity, banking, roads, etc. are not fulfilled at the same time. Therefore, with the increase in state income (NSDP), it gives the opportunity to the government to increase spending on activities left ideal or not taken at an optimum level.

On the other hand, tax revenue also has a significant impact on the growth of government expenditure in the long run. It shows that 1% increase in tax revenue will increase the government expenditure by 0.34% (inelastic) but significant at 5% level of significance, as the results are in line with Kau and Rubin (2002). It might be because the tax revenue was collected to increase the financial strength of the state and thus can spend more for developmental works. With the increase in tax revenue, the income of government also increases, which improve the financial stability on one hand and increases the own revenue generating capacity on the other hand.

Further, the grants from central government have a significant and positive impact on government expenditure over a long period. It might be due to the dependence syndrome which has emerged over the years where at least more than two decades, the share of central funds was highest in total government expenditure. Also, it might be due to the factor that the grants from the center are continuing and specific to every year, which has an easy flow to the state. The estimated results show that over long run 1% increase in grants from central will increase government expenditure by 0.84% which was expected.

The rate of unemployment increase the demand of goods and services from the government, which results in heavy increase of government expenditure, because the larger the rate of unemployment, the smaller will be the source of income for the people, and the government has to

intervene to provide basic services to the people like health, water, education, sanitation, etc. The results show that rate of unemployment has a negative and significant impact on the growth of government expenditure. It implies that with 1% increase in the rate of unemployment in the state the government expenditure reduces by 2% in the long run which was unexpected but is in line with Arewa and Nwakahma (2013). It might be due to the consequence that unemployment laid to the economy, increasing rate of unemployment in the state reduce the mobilization of resources internally, reduce the income level and thus reduce the consumption level as well which results in a decline in the size of government expenditure at a higher level due to a shortfall of income.

Similarly, from equation 3, the long-run estimates of error correction model show that gross fiscal deficit and per capita income has long-run association with government expenditure, but the only gross fiscal deficit has a negative but significant impact on government expenditure. It implies that with an increase of gross fiscal deficit of the state, the government expenditure will decrease. The long-run coefficient of GFD shows 1% increase in gross fiscal deficit in the state, the growth of government expenditure will decrease by 0.04%, and the result was expected because the growth in gross fiscal deficit reduces the efficiency of government spending in which more funds have to be issued to clear the outstanding bills and repay the borrowings which were used to reduce the deficit. While, the per capita income was found positive but insignificant to influence government expenditure in the long run.

Table 4 also provides the results of short-run dynamic coefficients associated with long-run relationship obtained from two ECM equations. The short-run estimates of equation 1 show that government expenditure, tax revenue, and unemployment of previous years have a significant impact on current year's government expenditure. The results show that 1% increase in government expenditure and tax revenue in the previous year will increase the current year's government expenditure by 0.44% and 0.26%, respectively, while 1% increase in unemployment rate in the previous year will reduce the government expenditure by 5.2% as coefficients are significant at 5% and 10% level of significance. In the short run, NSDP and grants from central of the previous year have a positive impact but are insignificant to produce a change in current year's government expenditure. The estimated coefficient for the error correction term ECM (0.201) denoted by C (1) of equation 1 reveals the short-run effect of the change in explanatory variables on the dependent variable. The results confirm that government expenditure in Jammu and Kashmir has an automatic mechanism which response to deviations from equilibrium in a balancing manner. The ECM coefficient (−0.201) suggests a fast-speed adjustment strategy of 20%. It implies that approximately 20% of discrepancy the previous year is adjusted for the current year. In other words, the ECM term of equation 1 shows that any disequilibrium caused by respective variables in the short run can be corrected and bring 20% equilibrium in government expenditure in the long run.

Similarly, the short-run estimates of equation 3 show that gross fiscal deficit of previous year has a negative but significant impact on government expenditure. It implies that 1% increase in the gross fiscal deficit in the previous year will reduce the current year's government expenditure by 0.039%. While as government expenditure and per capita income of previous year shows positive impact but is insignificant to produce any change in current year's government expenditure. The speed of adjustment toward long-run equilibrium by variables in equation 3 carries the expected sign, and it is significant at 5% level of significance. The coefficient indicates a feedback of about 26% of previous year's disequilibrium from the long-run elasticity of gross fiscal deficit and per capita income. This means that the speed with which gross fiscal deficit and per capita income adjust from short-run disequilibrium to change government expenditure growth in order to attain long-run equilibrium is 26% within 2 years.

Thus, the overall result of economic determinants of government expenditure shows that economic variables have very week adjustment power to bring long-run equilibrium in

government expenditure and only a few economic variables are significant to promote growth in government expenditure in short as well as in the long run.

The regression for the underlying ECM equations 1 and 3 fits very well at $R^2$ of 63% and 53%. The reason for being a good fit is that it is statistically above the benchmark of 50 percent; hence, in terms of the goodness of fit, we can say that the test is fair. Both the models also pass the diagnostic tests of serial correlation, heteroscedasticity, normality test, and stability test (Table 5). The table shows that the estimated results are free from serial correlation and heteroscedasticity as the respective coefficient of both these tests is greater than 5% level of significance. Also, the Jarque-Bera statistic shows that the series of variables in both the models are normally distributed. A graphical representation of the cumulative sum (CUSUM) is also established for both the models. The cumulative sum (CUSUM) plots for both the models are shown in Figs. 1 and 2 from a recursive estimation of the model also indicate stability in the coefficients over the sample period.

## Impact of Political Institution on Government Spending

In this section, an attempt is made to ascertain the impact of political dimension prevailing in the state of Jammu and Kashmir, on the growth of aggregate government expenditure. Given the available literature on the problem at hand, we thought it is imperative to have political fragmentation, law and order, and election cycle as our explanatory political variables against the dependent variable of government expenditure. We believe that these variables are the main variables which identify the whole political scenario of Jammu And Kashmir State.

The OLS regression model has been used to identify the impact of the political variables on government expenditure. The analysis begins with a summary statistic to understand the time series properties of the variables. Table 6 shows the summary statistic of the variables.

The summary statistic of the political variables underlined for the study shows that they have considerable variation over the time period. Aggregate government expenditure also varies considerably over the years. All other time series indicators of political variables show a change in

**Institutional Arrangements and Fiscal Performance of Conflict Regions: An Indian Case Study, Fig. 1** Coefficients specification test (CUSUM test) equation 1

**Institutional Arrangements and Fiscal Performance of Conflict Regions: An Indian Case Study, Fig. 2** Coefficients specification test (CUSUM test) equation 3

political variables along with government expenditure over the tie period. The summary statistic shows that two-party collation government has emerged as the basic ruling in the state, while more civilian killings have been stated over the years as the median number of civilian killing is more than five hundred. The nonelection year is the median numbers of years where no election was fought.

Now moving further we estimate the regression model 3 of our estimated models to identify the impact of political variables on government expenditure. OLS regression model has been used. Ordinary least squares (OLS) provide consistent and efficient estimates of the parameters of the model. Table 7 estimates the results of regression model 3 of our estimated models along with diagnostic tests for accuracy and reliability of our results.

The results of political determinants of government expenditure are stated in Table 7. It is evident from the table that the coefficient of *Polfreg* (political fragmentation) and *lawnorder* (law and order) are positive and significant, while *elcyc* (election cycle) is negative and insignificant.

Political fragmentation (*POLFRG*) variable shows that it is significant to produce a significant change in government expenditure. The coefficients of political fragmentation show that 1% increases in the type of ruling in the state lead to increase government expenditure by 0.342% and was found significant at 10% level of significance. It implies that majoritarian government or in other words single-party government spends less as compared to two-party collation more than three-party collation and governor's rule. In other words, the findings show that collation governments and administration in governor's rule spend more than the single or majoritarian government. The results are in line with Perotti and Kontopoulos (2002). The results are interesting in terms of Jammu and Kashmir; it might be due to the issue that with more parties in collation, each party has its own vote bank, and political agenda to take forward, and it uses government expenditure to please their own vote bank. Also, each party in the collation has different spending priorities and power of decision-making which influence in budget making. Thus the larger the number of collation partners, the larger will be the demand of each party, the greater will be the distribution of power and political agenda, and thus the larger will be the government expenditure. The results are also reliable in the sense that during the election when separatists give election boycott call, the political parties in the collation

government and elected representatives form each constituency have to spend respective constituency to carry the legacy of vote bank. While as in majoritarian/single-party government, there is one common agenda, single-power authority, and one single priority of government spending, thus there is no other influence in budget making. Thus single-party government spends less than another form of government.

Interestingly, law and order (*lAWNORDER)* show a positive relationship with government expenditure. It shows that 1% increase in law and order problem lead to increase the government expenditure by 2.45% and was found significant at 5% level of significance. It implies that with an increase in a number of civilian killings, government expenditure increases in the state. The results are in line with Drazen (2000). The results are correct in favor of Jammu and Kashmir state. It is because with increasing civilian killings expenditure regarding security and administration increase sharply. Also, the government offers various compensations to the family of the dead person which increases extra expenditure. As the state has witnessed a long time period of heavy violence and unrest in

1990s and often feel during the current period, thus sharp growth in government expenditure can be expected.

Lastly, election cycle (*ELCYC*) was found a negative but insignificant factor to produce a change in government expenditure. The results are in line with Dash and Raja (2013) and are against the findings of Khemani (2004). It might be due to the nature of election in the state, where we often witness low percentage of voters' turnout. This implies that people hardly participate in the election to elect their representatives. Thus we cannot found any pressure group.

Table 7 also shows the significance of the model. The $R^2$ of 62% shows that independent variable is statistically explaining the change in a dependent variable. It shows that 62% change of dependent variable is attributed to the independent variable. The model is statistically significant as the Durbin-Watson statistic shows no indication of autocorrelation. Various other diagnostic tests were carried to understand the reliability of results and model. The results of those tests show that the equation of political determinants of government expenditure is significant and robust.

Table 7 also shows the result of the different diagnostic test. The results of the different tests showed that there is no problem of serial correlation and auto regression in our model and the residuals of the model are normally distributed. The CUSET (coefficient specification test) statistics for equation 4 in Fig. 3 reveals no serious omission of variables, indicating the correct specification of the model.

**Institutional Arrangements and Fiscal Performance of Conflict Regions: An Indian Case Study, Fig. 3** Coefficients specification test (CUSUM test)

## Conclusion

The paper investigates the linkages between economic and political institutions and fiscal performance in a conflict region of India, i.e., Jammu and Kashmir in the long as well as in the short run over the last 30 years. The study has found appealing results which can be generalized to conflict regions of the world for efficient fiscal performance. The economic institutions have positive tendency to bring equilibrium in government spending in the long as well as in the short run. The stabilized economic institutions adjust the government spending in a positive way leading to efficient financial structure. Therefore, in conflict regions, the governments should carefully drive the policies to uplift the economic activities, to efficiently mobilize internal revenue through taxes, to properly allocate grants, and to reduce the gap between revenue and expenditure. Further, change in political institutions such as change of government structure from the single majoritarian government to collation government and democratically elected government to presidents/governors rule increases the government spending in the conflict region. It seems that in order to control the government expenditure efficiently in conflict regions, majoritarian/single-party government is effective to avoid unnecessary expenditure which comes along with collation governments either of two parties or three parties or in governor's rule. As the conflict regions experience the long history of turmoil and political instability and often witness strikes, hartals, and bands which amplify public spending to an extreme level, in our understanding, we believe that with the more and more civilian killings, turmoil increases as people protest very strongly, which intensify hartals, strikes, stone pelting, etc., which further worsens law and order problem and so as public spending. Therefore, the governments need to carry proper

measures for maintaining normalcy in the state which will reduce unnecessary expenditure on aggregate spending and made effective use of funds for other development works.

# Institutional Efficiency and Financial Health

Greta Falavigna[1] and Roberto Ippoliti[2]
[1]Istituto di Ricerca sulla Crescita Economica Sostenibile (IRCrES), del Consiglio Nazionale delle Ricerche (CNR), Moncalieri (TO), Italy
[2]Department of Management, Università degli Studi di Torino, Torino (TO), Italy

## Synonyms

Bankruptcy enforcement and insolvency; Judicial efficiency and financial rating

## Definition

The concept of "institutional efficiency and financial health" refers to the positive relation between the court's ability to enforce the law and the expected debtor's ability to pay back the debts and its likelihood of default.

## Introduction

A financial rating is an evaluation of the credit worthiness of a debtor, that is to say, an evaluation of the debtor's ability to pay back the debts, as well as its likelihood of default. The risk of

insolvency can be estimated considering both quantitative and qualitative information and it can be intended as a proxy for the financial health of an enterprise. According to the recommendations on banking laws and regulations issued by the Basel Committee on Banking Supervision (i.e., the so-called Basel II), credit institutions have started to build an Internal Rating System (IRS) in order to define internal criteria to the credit market access. This means that, nowadays, along with the "Big Three" – which are the largest and best-known international rating agencies (i.e., Standard & Poor's, Moody's Investors Service, and Fitch Ratings) – all credit institutions can independently build their own rating taxonomy for the financial evaluation of enterprises, that is to say, they started to assess the financial health of potential debtors. This is even more significant after the economic crisis of the last few years. However, even if it is important to detect the insolvency to reduce the expected risks, there is the necessity to increase the current knowledge on the determinants of debtor's ability to pay back the debts. In particular, which might be the role of public institutions? Is it admissible the hypothesis that institutional efficiency might affect the financial health of these private subjects? What about judicial efficiency as a determinant of debtor's ability to pay back the debts?

## Theoretical Perspectives

Starting from the seminal propositions of Modigliani and Miller (1958), current literature suggests a significant relation between debts and default risk, highlighting the main related risks accepted by managers and/or shareholders with their business strategies (D'Mello et al. 2018; Obradovich and Gill 2013). On the one hand, researchers show that increasing the financial leverage (i.e., the ratio equals to financial debts and net capital), the managers, and/or shareholders returns grow, as well as the default risks. On the other one, literature focuses on the necessity of an appropriate balance of debts and net capital to decrease those potential default risks. Obviously, a trade-off between the interests of creditors and managers/shareholders might arise. Indeed, even if stockholders and managers might be attracted to augment debts, financial obligations have to be repaid and creditors can present application for bankruptcy if there is difficultness in attending the financial obligations. The same hypothesis can be extended to operating debts, that is to say, suppliers can apply for bankruptcy in order to obtain payments.

According to the proposed theoretical background, the courts' ability in enforcing the law can be determinant in pushing creditors to apply for a bankruptcy in case of insolvency, as well as the risks assumed by shareholders and/or managers. In other words, the higher the efficiency in the bankruptcy enforcement, the lower the risks assumed by these shareholders and/or managers, since the higher is the probability of a bankruptcy application by creditors and/or suppliers. This is exactly the main theoretical perspective proposed by this entry, that is to say, a positive relation between the risks of insolvency (by firms) and the institutional efficiency in enforcing the law (by courts), ceteris paribus. Which are the current evidence about this hypothetical relation? Can we support the proposed hypothesis about insolvency and institutional efficiency?

## Literature Evidence

The Organization for Economic Co-operation and Development (OECD) and the European Commission for the Efficiency of Justice (CEPEJ), as well as the European Court of Human Rights (ECHR) and the World Bank have analyzed national judicial systems in the last decades. These interests are clearly due to the positive economic impact of judiciary on national economic growth, with the possibility to increase peoples' wellbeing through the improvement of this key process. Starting from these preliminary results, academia has pushed the boundary of scientific knowledge even further, supporting the policy makers in the reform process of national judicial systems with the proposal of significant evidence on the best interventions. On the one hand, researchers have focused their interest on the determinants of courts performance,

while, on the other hand, they have analyzed more precisely the economic impact of an efficient enforcement system. In particular, among the determinants of courts' performance, researchers have identified the number of lawyers and the consequent induced demand of justice (Carmignani and Giacomelli 2009; Ippoliti 2015). At the same time, researchers have highlighted the key role of civil and criminal procedure rules (Lanau et al. 2014) and courts organization (Falavigna et al. 2018), the independence of judges (Rıos-Figuero and Staton 2014) and their incentive system (Posner 1993). Considering the expected positive externality on the national economic growth, which might be due to the courts efficiency in enforcing the law, academia has focused on the business demography, that is to say, the new entries on the market (i.e., entrepreneurship) and the growth of already existing firms (i.e., investments). Accordingly, current literature has emphasized a positive correlation between the efficiency level of courts and the presence of larger firms, as well as a higher level of new entrepreneurial initiative on the market (Falavigna et al. 2017). In other words, a healthy environment in which there is certainty about the enforcement of rights and rules adopted by the policy maker and public authorities can have a positive impact on the national economic growth (Beck et al. 2006). What about the finance? Is there any evidence about a positive impact of institutional efficiency and financial health of enterprise?

According to current literature, the performance of a national legal system in enforcing the credit rights can affect the access to the financial market (Bianco et al. 2002), as well the financial structure of enterprises (Carmignani 2004). Moreover, researchers have highlighted that the mortgage interest rates are correlated to the enforcement ability of the legal system (Meador 1982), as well as the presence of less lending and more non-performing loans where the enforcement system is not efficient. Obviously, a healthy financial environment, that is to say, a market where there is certainty about the solvency of financial obligations assumed by firms and consumers, can positively affect the economic growth of a country (Beck et al. 2006). Indeed, as well as suggested in the previous theoretical section, the enforcement of credit rights might support

**Institutional Efficiency and Financial Health, Fig. 1** Determinants and impact of judicial efficiency. (Source: Falavigna et al. 2017)

the financial health of an enterprise, reducing the risks assumed by managers and/or shareholders on the market and, in this way, the expected risk of insolvency.

Figure 1 synthesizes the determinants and the expected impacts of judicial efficiency, as well as highlighted in this section according to current literature (Falavigna et al. 2017). On the one hand, we can observe the determinants of judicial performance (i.e., the judicial independence, the current incentive system of judges, the adopted procedural rules, as well as the litigiousness or the number of lawyers), while, on the other hand, we have the main impacts of courts ability to enforce the rule on the economy (i.e., a more vivacious business demography and a dynamic financial market with less distress), which can lead to a significant national economic growth.

Moreover, an efficient judicial system might contribute to create an opportunity structure, that is to say, a system with a high capacity can support the creation of an institutional, social, and economic framework able to stimulate and to facilitate both investments and entrepreneurial initiatives (Falavigna et al. 2017). All of these positive impacts can shape the market, providing opportunities to start new successful businesses or improve the already existent ones, with good financial health.

## Conclusion

This entry has provided an overview of what is known about judiciary and financial health, suggesting that the ability of the judicial system in enforcing the law can be considered as a key determinant of enterprises' ability to pay back their debts. On the one hand, we can imagine a negative relation between the risks assumed by the managers of these enterprises and courts' efficiency in enforcing the financial obligations they assumed on the market. On the other hand, the same judicial inefficiency and the incapacity to deal promptly with the debtor insolvency can affect negatively the creditors. These results are even more significant if we consider the recent financial market crises and the growing relevance of leverage.

The opportunity to exploit the tax-shield, which could be due to the deductibility of financial interests, can induce firms to a very high level of borrowing on the financial market. This strategy is coherent with the approach proposed by Modigliani and Miller (1958), who suggest that the bankruptcy risk can affect the decision-making process of managers and/or shareholders. On the one hand, if there are taxes but not bankruptcy risks (and the related costs), the optimal financial structure is a level of debts equal to 100%. On the other hand, if the bankruptcy risk is present (i.e., costs of default higher than 0), managers and/or shareholders will mitigate the advantages from tax-shied, that is to say, they will adapt accordingly the financial level of debts. Accordingly, if managers and/or shareholders expect a high level of courts' ability in enforcing financial obligations (i.e., the judicial system is efficient), we cannot reject the hypothesis that they will reduce the leverage exposure and the related default risks, entailing – ceteris paribus – an increasing of their financial rating. This is exactly the main contribution of this entry: a positive relation between judicial efficiency and financial health, which is strongly supported by current literature and the evidence proposed by international institutions and academia. This relation could support the policy maker in the reform process of this key public institution and, indirectly, the national economic growth.

# Institutional Foundations of Local Self-Government, Russia

Ivan Leksin
School of Public Administration, Lomonosov Moscow State University, Moscow, Russian Federation

## Synonyms

Institutional Organization of Local Self-Government; Municipal Governments

## Definition

Although both subnational units (constituent entities of the Russian Federation) and local (subregional) entities enjoy self-government, this term is being officially applied only to the latter. Self-government of this kind can be called administrative autonomy; however, local entities are not termed autonomous neither by federal nor by regional legislators.

Local self-government is being exercised in subregional units of several types that are generally referred to as "municipal formations" (meaning "municipal entities"). The latter is not a constitutional term. It has a doctrinal origin and did not appear in federal legislation until 1995. Currently the Federal Law No. 131-FZ dd. 6 October 2003, "On the General Organizational Principles of Local Self-government in the Russian Federation" is devoted to these entities. Incidentally, the latter are not termed "municipalities" officially (the said Federal Law uses the term mentioned above), though this word is used by scholars and experts (Avakyan 2013). However, in some regions, the word "municipality" is used as an official name for either an executive or a representative body of municipal entities.

Jurisdiction assigned to municipal entities is formally titled "issues of local significance." The institutions that are vested with powers to decide upon these issues are literally named in the legislation the "organs of local self-government" (meaning the "bodies exercising self-government on the local level"). Almost equivalent to the latter is the term "organs (i.e., bodies) of municipal entities" (however, some of these bodies are not termed bodies of local self-government). Due to awkwardness of these officially recognized collocations, the terms "municipal governments" and "local governments" shall be used instead in the following.

## Introduction: Historic Background

During the last decades, the local level of government in Russia had undergone a number of drastic

institutional changes (Kutafin and Fadeev 2013). In the Soviet period of Russian history, both the political system and the system of public administration had not differentiated regional and local governments, and up until 1990s they used to handle without the notion of self-government. The Soviets (councils of people's deputies) in the krais (territories), oblasts (provinces), autonomous oblasts (autonomous provinces), autonomous okrugs (autonomous districts or autonomous areas), districts, cities, city districts, settlements, etc. had been being constitutionally characterized only as "local organs of state power" (meaning the "local bodies exercising power on behalf of the state"). The executive committees of the Soviets had been being titled the "local organs of state administration" (meaning the "local bodies exercising public administration on behalf of the state").

The Law of the Russian Soviet Federative Socialist Republic (RSFSR) dd. 24 May 1991 No. 1329-1 "On Amendments and Additions to the Constitution (the Basic Law) of the RSFSR in Connection with the Reform of Local Self-Government" introduced the words "local self-government" into the Russian Constitution. These words referred to the governments at the district level and below. The governments at the upper orders retained their terminological affiliation with the state. Detailed provisions regarding institutionalization of local self-government were expounded in the Law of the RSFSR dd. 6 July 1991 No. 1550-1, "On Local Self-Government in the RSFSR."

The constitutional crisis of 1993 had led to demolition of the Soviet system of government. The new Constitution of the Russian Federation adopted on 12 December 1993 had emphasized the distinction between the state and the local self-government and actually legalized multiplicity of institutional patterns of the latter, as it contained no provisions regarding construction of the local governments, but solely provided for establishment of common principles of organization of the system of local self-government.

The first of the federal laws enacted under this constitutional provision, the Federal Law No. 154-FZ dd. 28 August 1995 "On the General Organizational Principles of Local Self-Government in the Russian Federation" did not set binding rules regarding either the levels for the local self-government to be exercised or the types of municipal entities, thus leaving the legislators of the constituent units of the Russian Federation much space for creativity. The said Federal Law had not affected the construction of the local governments much as well, as all local bodies of the municipal entity except elected representative body were regarded to be optional. No guarantees for financial self-standing of municipal governments were provided, thus most municipal entities remained highly dependent on the transfers from the regional budgets.

Interregional diversity of institutional systems of local self-government had lasted out up until the abovementioned Federal Law No. 131-FZ dd. 6 October 2003 had come into force. This legislative act brought uniformity into organization of local self-government and obliged the regions to provide for establishment of municipal entities throughout their territory. Implementation of this reform took more than 5 years. It implied total territorial reorganization of local self-government and a dramatic reallocation of powers that resulted in imposing dozens of unfunded or poorly funded mandates on local budgets and thus increased their dependence on the regional transfers. Certain efforts had been made intermittently to remove this imbalance, but the gap between actual local revenues and the funds required for due financing of all mandates ascribed to local governments is still prodigious.

## Constitutional Bases of Local Self-Government

The Constitution of the Russian Federation contains scarce provisions describing organization of local self-government. The basic constitutional principle of local self-government is set in Art. 12 of the Constitution. It reads as follows:

- In the Russian Federation, local self-government shall be recognized and guaranteed.

- Local self-government shall be autonomous within the scope of its powers.
- Local governments shall not be affiliated with the state.

The last two guiding lines provoked multiple disputes among the Russian scholars, experts, and politicians. Ambiguity of these rules and their irrelevance to the customary system of governance caused heated criticism at their origin, and the pessimistic view on them is still typical (see, e.g., Avakyan 2010).

However that may be, the sphere of local self-government was not defined by the constitutional provisions. The Constitution of the Russian Federation divides powers between the Federation and its constituent units only, thus leaving no exclusive jurisdiction to municipal entities (see ► Multilevel Governance and Public Administration, Russia).

Chapter 8 of the Federal Constitution that is promisingly called "local self-government" includes quite imprecise formulas open for a broad interpretation. According to Art. 130, local self-government in the Russian Federation ensures that the population shall decide upon the issues of local significance, of possession, use and disposal of municipal property. Local self-government shall be exercised by citizens through referenda, elections, and other forms of direct expression of the will of the people and through elected and other bodies of local self-government. Art. 131 of the Constitution reads that local self-government shall be exercised in urban and rural settlements and in other areas with the consideration for the historical and other local traditions. The structure of local self-government bodies shall be determined by the population autonomously, and the changes in borders of municipal entities shall be performed with consideration of the opinion of the population of the corresponding areas. Following to Art. 132 of the Federal Constitution, municipal governments shall independently manage municipal property; form, adopt, and implement the local budgets; impose local taxes and dues; ensure protection of public order; and decide upon other issues of local significance. Municipal governments may be vested by law with certain state powers and receive the necessary material and financial resources for their implementation. The implementation of the delegated powers shall be controlled by the state. Art. 133 provides for the rights of local self-government for judicial protection and compensation for additional expenses emerging from decisions of regional and federal governments and bans abridgment of the rights of local self-government fixed by the Constitution of the Russian Federation and federal laws.

## Municipal Entities

Under the mentioned Federal Law No. 131-FZ dd. 6 October 2003, the whole of the territory of every constituent unit of the Russian Federation should be distributed between municipal entities. Several kinds of the latter can be created:

- Single-tier intracity areas within the cities of federal significance (as of 1 January 2016, 267 of such municipalities existed)
- Municipal areas as upper-tier municipalities within other constituent units (1,788, as of 1 January 2016)
- Rural settlements and urban settlements as lower-tier municipalities within municipal areas (as of 1 January 2016, 18,177 and 1,592, respectively)
- City districts (the legislator uses the term "city district" for the city territory with adjacent areas) that can be either single-tier (560, as of 1 January 2016) or upper-tier municipalities (3, as of 1 January 2016)
- Intracity areas within city districts (as of 1 January 2016, 19 municipal entities of this type existed)

Totally, more than 22,400 local governments currently operate in Russia. Distribution of municipal entities between constituent units of the Russian Federation is, predictably, unequal. Total number of such subregional entities varies from 9 (in the Magadanskaya Oblast) to 956 (in the Republic of Tatarstan).

Alongside with municipal entities, administrative territorial units exist in every region. These

are creatures of the regional governments and are designated for allocation of territorial offices of the regional executives. These units coincide with municipalities frequently, but the matches and mismatches between their borders are situational.

## Municipal Governments

According to the mentioned Federal Law No. 131-FZ dd. 6 October 2003, on default municipal government shall comprise of the representative body, the head of the municipal entity, the local administration (the executive body), control and accounts board, other bodies and elected officials provided for by the statute (charter) of the municipal entity. On default it is mandatory that the representative body, the head of the municipal entity, and the local administration were included into the structure of the government of the municipal entity. Exceptions are envisaged for:

- Settlements acting as administrative centers of municipal districts (executive bodies of the latter can perform the functions of local administrations for such settlements)
- Settlements with no more than 100 voters (in such settlements representative bodies are not elected, and their functions are performed by the gatherings of the voters)
- Settlements with 101–300 voters (in such settlements representative bodies can be replaced by the gatherings of the voters)
- Single-tier intracity areas within the cities of federal significance (in such municipal entities a local administration can be absent)

Representative body of the municipal entity is usually called "council," "assembly," or "duma" (this historic term meaning "considering entity" had been brought back to political and legal practices after the Soviet period).

In most municipal entities, representative bodies are elected directly by the voters. In the city districts, such bodies can be composed of the delegates from the representative bodies of the intracity areas, and in municipal areas, of the delegates from the representative bodies of the lower-tier settlements and of the heads (chief officials) of the latter.

The federal legislator had defined the bottom limit for the size of representative bodies:

- In settlements and city districts, they cannot comprise less than seven deputies, and this limit rises with the population size (for instance, in the municipal entities with over 0.5 million inhabitants, representative bodies cannot comprise less than 35 deputies).
- In municipal areas, they cannot comprise less than 15 deputies.
- In intracity areas, they cannot comprise less than ten deputies.

On default, the deputies of the representative body of the municipal entity serve on a non-permanent basis (it is permitted for only up to 10% of deputies of the certain representative body to be permanently employed).

Electoral system is to be selected by the municipal entity itself with consideration of the requirements that can be set by the regional law. The latter in its turn should comply with the federal rules. These are as follows:

- The candidates can be either self-nominated or nominated by social associations constituted as political parties, social organization, and social movements.
- In the settlements with population under 3,000 inhabitants and in the settlements and the city districts with representative bodies consisting of less than 15 deputies, only majority voted system can be used.
- In case the majority voted system is being applied, both single-member and multimember (up to five members) constituencies can be formed.
- In case the mixed member proportional representation system is being applied, no less than ten mandates should be distributed between the lists proposed by the mentioned social associations.

Elections can be held every 2, 3, 4, or 5 years (to be determined in the statute of the municipal entity according to the guidelines set in the

regional law). The status of the municipal deputy can be terminated before due date in case of:

- Physical disability
- Resignation at his or her own discretion
- Losing his or her eligibility (e.g., having been declared by a court as having no legal capacity or as having a limited legal capacity, being sentenced for the crime, termination of the Russian Federation citizenship)
- Being recalled by the voters
- Resignation from the party he or she had been nominated by
- Dissolution of the representative body of the municipal entity

The representative body of a municipal entity can be dissolved early in several occasions:

- By its own decision
- By a court decision establishing insufficiency of the number of acting deputies for carrying out the sessions of the representative body
- By a regional law following the court decision establishing that the representative body had not conducted sessions for 3 months consecutively
- By a regional law following a court verification of the 3-month long evasion of executing the court decision establishing violation of federal or regional legislation by an enactment issued by the representative body
- In case of reorganization of the municipal entity

Representative bodies of municipal entities are the primary instrument of decision-making on the local level of government. The powers of such bodies include:

- Adoption of the statute of the municipal entity
- Adoption of the local budget
- Establishment of local taxes and fees
- Adoption of plans and programs of development of municipal education
- Setting procedures for managing and disposing of municipal property, for making decisions on formation, for reorganizing and liquidating municipal enterprises, etc.
- Monitoring execution of powers by municipal bodies and officials
- Deciding upon retirement of the head of the municipal entity

The head of the municipal entity (in some municipalities this post is called "mayor" or "elder") is its chief official that officially represents it in relations with other governments, signs local acts and agreements, and issues acts sui juris. He can be elected in several ways:

- At municipal polls
- By the representative body of the municipal entity from among the members thereof
- By the representative body of the municipal entity from the nominees recommended by the contest commission
- By the gathering of the voters (in the settlements with no representative bodies)

Depending on the way of election, the head of the municipal entity can play different roles within municipal government:

- If elected at municipal polls or by the representative body of the municipal entity among the members thereof, he or she shall become either a chairman of the latter or the head of the local administration.
- If elected by the representative body of the municipal entity from the nominees recommended by the contest commission or by the gathering of the voters, he or she shall become the head of the local administration.

On default, the head of the municipal entity cannot combine the presidency in the representative body with the leadership in the local administration. Exception can be made for the rural settlements and for intracity areas within the cities of federal significance.

Term of office of the head of the municipal entity can be set in a range between 2 and 5 years, similar to the municipal deputies' term. His or her powers can be terminated before due date in numerous cases, such as:

- Physical disability
- Resignation at his or her own discretion

- Losing his or her eligibility (e.g., having been declared by a court as having no legal capacity or as having a limited legal capacity, being sentenced for the crime, termination of the Russian Federation citizenship)
- Being recalled by the voters
- Court verification of the 2-month long evasion of executing the court decision establishing violation of federal or regional legislation by an enactment issued by the representative body
- Evasion of executing the court decision that established either committing actions or taking decisions by the head of the municipal entity entailing infringement on the rights and freedoms; menace to the unity and territorial integrity of the Russian Federation, to the national security of the Russian Federation and its defensive capability, and to the integrity of the legal and economic space of the Russian Federation; or misspending of subventions from the federal or the regional budget
- Failure to discharge his or her duties for 3 months
- Taking decisions leading to an overdue municipal debt exceeding the limits set by law
- Budgetary infringements or violation of federal legislation (having been established by the court) in the course of executing powers delegated by the regional or federal governments
- Two consecutive unsatisfactory assessments of his or her activities by the representative body of the municipal entity
- Failure to observe the restrictions and bans established by legislation on counteracting corruption, e.g., establishing accounts in foreign banks or using foreign financial instrument by the head of the municipal entity himself or herself or by a member of his family (this restriction applies for the heads of municipal areas and city districts)
- Reorganization of the municipal entity

Some of these measures can be taken by the representative body of the municipal entity, some by the chief official of the constituent unit of the Russian Federation, and some by the President of the Russian Federation. Excessiveness of grounds provided for political and legal responsibility of the heads of the municipal entities had made these offices relatively unpopular. In the recent years competition for the latter had significantly decreased.

The local administration of the municipal entity is an executive body headed by either the chief official of the municipal entity or by a manager hired by the representative body of the municipal entity on a contractual basis. The non-elected head of local administration is considered to be a municipal servant, unlike the elected one (the latter does not come within the purview of the legislation regarding public service).

The structure of a local administration can vary significantly depending on the type and size of the municipal entity. In a rural settlement, it can consist of several officials, while in a municipal area or in a city district it can be divided into dozens of departments.

Under the federal and regional legislation on local self-government, this body is accountable for its decisions and actions to the representative body of the respective municipal entity. However, in most municipal entities, local administration is the only continuing body. Given the fact that the controlling capacities of the representative bodies are limited and dependent on the local population's political activity (which is not high, in general) and that the regulatory functions are concentrated in the local administration, the latter often appears to be the dominant body within municipal government.

## Powers of the Local Governments

The powers of local governments do not cover an exclusive sphere of jurisdiction that could be separated from the regional one. The "issues of local significance" that are listed in the said Federal Law No. 131-FZ dd. 6 October 2003 are concentrated within joint jurisdiction of the Russian Federation and its constituent units. Moreover, these issues may fall within the constitutional spheres of jurisdictions that are considered to be the exclusive ones of the Federation and of its constituent units, as these spheres are marked by the

boundaries of legislative powers of the said orders of government that do not coincide with the boundaries of the spheres of public administration (see ▶ Constitutional Federalism and Public Administration, Russia; ▶ Multilevel Governance and Public Administration, Russia). Thus, the assertion that municipalities enjoy self-government implies that they execute federal and regional laws. In going this they issue regulations, but the latter are not called "laws."

The "issues of local significance" are primarily the ones concerning local budget, local taxes and fees, municipal property, provision of primary fire safety, maintenance of communications, public catering, trade and everyday services, cultural activities, physical training and popular sports arrangements, municipal archives, etc. Allocation of other powers is asymmetrical in several dimensions:

- The lists of powers that the governments of single-tier, upper-tier, and lower-tier municipal entities have to exercise are not uniform, naturally.
- Within each of these types, certain jurisdictional differences can be found (e.g., single-tier city districts within most current constituent units of the Russian Federation are considered to be the most powerful municipal entities, while single-tier municipalities within three federal cities exercise quite few powers reserved for them at the discretion of the cities' legislatures).
- For different types of municipal entities, the said Federal Law sets separate lists of powers to be exercised at the discretion of the respective local governments (i.e., in case they have a will and sufficient funds for that).

However that may be, the overwhelming majority of local governments are far from financial self-sufficiency. Thus, they have to rely on the upper budgets in order to exercise their powers. Consequently, they become highly dependent on the governments of the respective constituent units of the Russian Federation. Besides, in the course of time, increasingly more powers had been being delegated to the local governments by the regional ones and even by the federal government. Such delegation is being carried out either by means of legislation (regional or federal) or by agreement. As a result, municipal entities become integrated into a single federal-regional-municipal system of public administration.

## Conclusion: Local Self-Government or Local Agents of Upper Governments?

According to the constitutional concept, the institutions of municipal entities are considered to be the institutional basis for local self-government functioning separately from the regional and federal governments. However, this idea that had been rising political and scientific disputes in the end of the last century and in the beginning of the current one had been ruined by political, legislative, and administrative practices.

During the past 15 years, much had been done by the federal government in order to constitute a pervasive structure of decision-making and implementation that would encompass not only federal and regional orders of government but a local one as well (Leksin 2011). At present, local governments and their officials are:

- The executors of federal and regional laws
- The agents of regional and federal governments within the issues delegated by respective legislators
- The operators of funds transmitted from regional and federal budgets
- The bodies and the persons that are accountable before the regional and federal governments
- The ones answerable and chargeable for violation of federal and regional laws and for misuse of regional and federal money

As a result, currently municipal governments function not just as institutions deriving from local communities but primarily as an infrastructure for execution of the regional and federal powers. Correspondingly, their activities are mostly aimed not at solving tasks of purely local significance but at conducting nationwide and region-wide policies, meeting national and regional standards, and providing public services throughout the country.

## Synonyms

Citizens; Institutions and public organizations

## Definition

Institutional governance is a simplified conceptual framework that can aptly explain how the behavior of public sector organizations is influenced by their interaction with those actors taking part to social life, meaning citizens and institutions.

## Introduction

Since the 1970s, an international reform movement called New Public Management (NPM) started criticizing the inefficiencies of the public sector and arguing that public organizations were managed without taking into account citizen benefits and resource consumption. The approaches implemented in the private sector were considered more efficient and effective (Hood 1991). Consequently, the reform processes resulting from this movement aimed to move those economic activities that were managed by public institutions back on the market and competition. Moreover, the adoption of management and accounting instruments and approaches commonly implemented by private firms was proposed for public sector entities. The results, however, have often been disappointing. Private and public entities can be similar in how they are organized and managed; the main difference, however, lies in that the latter are not privately owned, but pertain to the community as a whole. Public management studies, therefore, require an understanding of the way the community is organized, its articulation into various entities, and mutual influence between political bodies and administrative organizations. From a holistic approach, every public organization interacts with the environment in which it operates, its culture and institutions. Specifically, these dynamics of social life could be explained through the concept of "institutional governance," which is interpreted here through a simplified conceptual framework, resulting from the interaction between three relevant classes of actors: citizens, institutions, and public organizations. The following sections describe these components and a model that help represent and explain these interactions.

## Citizens and the Widespread Culture

Citizens represent the key element of the institutional governance framework: the institutions are in fact their highest collective expression. The most relevant feature of a citizen is culture, which is a complex concept that pertains to a person's education, values, beliefs, behaviors,

and interpersonal relationships. In this wide meaning, every person has their own culture that comes from their religion, philosophical and ethical principles, family, experience, and environmental habits. From another point of view, each society has its commonly shared values, beliefs, and ways of behaving and interacting with other people, which can be defined as the widespread culture of that society. According to the formal jargon of economists, the term culture expresses the social norms and the ideas and thoughts common to several individuals that govern interaction between them (Tabellini 2005; Greif 1994).

A widespread culture can be characterized by features such as: (1) the idea of the state as a collective organization created to serve people, or as an ethical entity super-ordinate to the citizenry; (2) the appreciation for a government that limits itself to the management of a minimum of rules that guarantee coexistence, or for a wide public sector that heavily affect collective life; (3) relationships among people routed in equality in dignity and rights, or differences in social classes, races, religions, etc.; (4) the strong perception of community and common good, or the prevailing sense of belonging to the family clan; (5) honesty in public affairs, or widespread corruption; (6) intensity of political and social participation, mutual trust, collective loyalty, or a fatalist view of public life that rejects participation and collective action (Banfield 1958; Hofstede 1985; Putnam 1994).

## Institutions and Institutional Models

The expression "institution" is often used as a catch-all concept that means different things. In a broad sense, institutions are defined by North (1990, p. 3) "the rules of the game in a society or, more formally, the humanly devised constraints that shape human interaction." A keyword of this definition is "constraints." Thus constitutional laws, electoral rules, norms, and practices that define the ways a society is organized at all levels are good examples of institutions. Regulations state how the citizen representatives are elected, how they decide and behave, and the way public administration is managed. The word "institution" also refers to the bodies established and responsible for collective life – legislative assemblies, executive boards, and judicial powers –, the rules concerning their formation and functioning, and the relationships among individuals. In defining institutions, North is careful to make the distinction between them and organizations. Both are components of the institutional governance framework, but they are not the same. As stated previously, institutions can be considered the rules of the game, while organizations can be considered the players. The rules aim at defining the way that the game is played.

Institutions are shaped by citizens and derive largely from historical contingencies, international influences, and, last but not least, by chance. On the one hand, culture and institutions interact with each other in continuous and significant ways. Thus, as some scholars argue, "culture" is a fundamental means of historical influence that can explain why the same formal institution functions so differently in diverse environments (Glaeser et al. 2004). On the other hand, institutions influence citizens; it is reasonable to think that equitable and functional institutions virtuously influence citizens' behavior. On the contrary, inefficient institutions suffer from a variety of problems such as pervasive corruption, rent seeking, clientelism, and nepotism. Different combinations of these problems could lead to institutional and government failure, reducing the capacity of governments to efficiently deliver public goods and policies, and tend to multiply citizens' opportunistic and immoral behaviors (Rodríguez-Pose and Storper 2006).

Institutional models are based on the distinction between absolutist and democratic regimes. In the former, coalitions of power groups, such as the military, can express governmental bodies without free consent statements made by citizens. The latter, on the contrary, is founded on choices among various political offers made at the electoral stage by the citizens themselves. Democratic regimes are generally classified as consociational or competitive (Forte 1988). The following description focuses on this distinction.

## The Consociational Model

The consociational model is based on assemblies expressed by all citizens according to proportional electoral rules. The emphasis is on the representativeness of the institutions: all groups, interests, and views that have a minimum of political visibility can express their representatives in national and local councils, where laws and general rules are issued and executives are elected. These regimes do not allow a single political party to reach the absolute majority of votes and to choose the executive body; as a result, coalition governments are necessary. The central point of the analysis is that politicians want to maintain their privileged status, which comes from citizen consensus, and that the politicians' behavior is therefore geared toward acquiring the consensus itself (Buchanan and Tullock 1962). Thus, in consociational regimes, political groups focus on the interests of few but decisive stakeholders, whose consent can attribute a significant relative weight in those coalitions. The political environment is characterized by a constant conflict situation, because each group continuously tries to improve its relative power, but seldom in a framework of strong general stability, thanks to long-standing agreements with the opposing forces. Relevant widespread interests are overlooked as their satisfaction would not allow politicians to establish relationships with specific groups of citizens which would result in electoral consensus. It is thus possible to note that little attention is paid to the general utility that comes, for instance, from large projects of common interest.

## The Competitive Model

The competitive model is characterized, with significant differences, by assemblies founded on majority rules and sometimes by the direct election of the chief executive. Here a single party has the actual possibility to conquer the political power, reached through relative majorities. As a result, various groups have to seek the consensus of vast parts of the electoral body through programs and actions of great scope and visibility. In competitive regimes, thanks to a direct relationship between the executive body and the citizens, a stronger consistency between goals and resources is often observed, at the expense of scarce or no attention to minority group interests. Elected officials usually have the power to run coherent governmental actions; they are also interested in maintaining popularity and pleasing voters in order to be re-elected (Alesina and Tabellini 2007).

## A Comparison Between Institutional Regimes

The two institutional models considered here reveal dissimilar characteristics that affect the social and political environment, generate diverse constraints and opportunities, and bring about the selection of those politicians adapting best to those features. In the consociational model, the minority group consent is sought through the protection of its specific interests; in the competitive one, the majority group consent is pursued through the definition and implementation of programs that can be welcomed by a vast number of citizens.

The central issue of public sector governance seems therefore to be the identification of control tools and objectives able to force politicians in the pursuing of collective utility at a satisfactory level. To this end, it is necessary to consider the existing institutional system, its features, and outcome over the behavior of social life actors.

Besides the fact that the real world reveals various regimes, not easily attributable to the mentioned simplified models, the preference accorded to a particular institutional model involves a value judgment, as the choice is based on a particular idea of what "collective utility" is. Does preference have to be given to the will of the majority and the government authority or to the preservation of the interests of minorities, even at the expense of having weak governments? In the former case, it is then necessary to avoid the "tyranny of the majority" (de Tocqueville 1840); in the latter, it is essential to determine what is the minimum dimensional level of the groups and the quality of the interests to be guaranteed.

From an economic point of view, the competitive model has some obvious advantages. Even with the imperfections due to a competition that is discontinuous, as it only takes place during the

electoral rounds, political groups have to propose actions and goals that can influence large communities. Conversely, when no political party alone can reasonably aspire to gain political supremacy, attention will be directed to smaller groups whose interests have to be protected in order to reach a better result. Hence, it is possible to observe the formation of inhomogeneous governmental coalitions, characterized by perpetual conflict and disorganized public action.

## Public Sector Organizations

The features of the institutional model strongly affect the rationale and conduct of decision makers and the way the different organizations behave and perform. It is useful here to classify public sector entities as democratic or instrumental. The former are founded on bodies elected by the citizenry, such as the various state-level administrations, regions, and municipalities; the latter are controlled by a democratic organization that chooses and steers their general managers.

In the consociational model, public administration is characterized by poor accountability. While financial rigor is not a central issue in the political project, spending activities are desirable, particularly when it is clear whom they come from and who benefits from them. Within public sector units, loyalty toward political parties ultimately tends to be rewarded. Management and operations of local authorities, founded on elected councils, are particularly fragmented due to the plurality and inconsistency of the actual purposes. Instrumental organizations, not founded on elected assemblies, are obviously influenced by the rationale that informs controlling authorities. Because of the lack of clearly stated goals and accountability, top managers are chosen according to a criterion of political loyalty and interest defense.

In competitive models, instrumental organization management – e.g., public transport service – is a key element of the entire political system. Its performance is subjected to immediate and direct judgment by the citizenry and therefore affects the public approval of the governmental political group. They will, therefore, be required for functionality and consistency with the general policy design. The selection of general managers is based primarily on professionalism rather than their political connections with those controlling the democratic organizations.

## Citizens, Institutions, and Public Sector Organizations

As stated previously, the above-described classes of actors – citizens, institutions, and public organizations – can be integrated in a simplified "institutional governance" conceptual framework that depicts social life and actors' behavior. Only a few relevant characteristics are considered (Table 1); firstly the citizenry widespread culture, consisting of ethical values, beliefs, behaviors, and ways of interpersonal relationships. As for the institutions, the framework only considers how efficient they are, which means evaluating exclusively their ability to allow the socioeconomic system to meet the needs of citizens with the least use of resources. Public organizations are characterized by their specific organizational culture – e.g., that of legality and compliance with laws and regulations, or that of management for objectives – and specific organizational variables. Different management tools are used, such as accounting systems, personnel policies, and management styles (Pavan and Reginato 2012, pp. 29–37).

The conceptual framework is holistic in nature; therefore, every element has to be coherent with the others. An accounting system derived from private sector, for instance, has to be evaluated not per se but for its general consistency with the other components. The culture of the single economic unit is influenced by the one that is widespread in the reference environment and can be characterized by values such as the sense of civic duty, the seeking of collective well-being, the mutual trust, the sense of ethics, or by individualism, fatalism, opportunism, and corruption. These concepts can

**Institutional Governance, Table 1** Characteristics of public sector actors

| |
|---|
| Citizens: widespread culture |
| Institutions: efficiency |
| Public administrations: culture and organizational variables |

be hardly defined rigorously, and yet sociological research (Hofstede 1985) shows that huge differences exist between countries.

The framework components interact with each other. As actors with their relevant features are included and outlined, it is now possible to state that the institutional governance performance is a function of the degree of consistency existing among the characteristics itself: that is, the widespread culture, the institutions' efficiency and the organizational variables adopted by the administrations.

The conceptual framework is presented (Fig. 1) according to a triangular drawing that shows actors dynamically. Observed clockwise, the scheme shows the actors' rationale behavior and the resulting outputs. As every person and group brings about their own interests, the model assumes that citizens, taken as a whole, express their consent to the institutions through both the electoral choice of representatives, as well as the continuous social pressure of the public opinion.

The institutions' behavior results in the decision making regarding the issuing of laws, rules, and regulations, which particularly affect collective wealth management and the economy in general. The public organizations' behavior depends, in the first instance, on such decision-making. They are responsible for providing services such as public security, national defense, justice, education, healthcare, etc.

The triangle can be also read anticlockwise (Fig. 2). Thereby, it shows that there is interaction among the actors. Citizens affect the behavior of public entities through social pressure. They will ask for high-level services or for personal privileges. Public sector organizations provide the institutions with the information they need for their decision-making. Finally, citizens interact with institutions. As previously mentioned, institutions are shaped by citizens. At any time in history, however, there are institutions that have not been specifically intended by the citizens of the time. On the other hand, observation of reality seems to show that institutions in place are not neutral with regard to the behavior of citizens. When institutions are efficient and provide excellent services, citizens can probably deal with their businesses and work, show more willingness to pay taxes, and so on. When institutions are unsatisfactory, new problems arise and everyone is forced to fend for themselves, particularly to look for privileged relationships with the public apparatus. Ultimately, inefficient and corrupt institutions will affect citizens in a negative way and will particularly reduce their community spirit.

## Conclusion

Explaining public sector organization behaviors requires a deep analysis of their environment. The "institutional governance" conceptual framework

**Institutional Governance, Fig. 1** Actor's outputs

**Institutional Governance, Fig. 2** Reactions

helps to explain how their behaviors are influenced by the interactions with the other actors taking part in social life: citizens and institutions. In the long run, organizations' behavior may be changed as a result of their interaction with institutions – the rules of the game – and the citizens' widespread culture. The improvement of social life quality is a complex process in which institutions play a relevant role. At the same time, the historical evolution of institutions itself reflects the interrelations between citizens' culture and public sector organizations. Comparative historical analysis of the institutional governance framework can contribute to predict future behavior and to develop public policies aimed at collective utility, efficiency, and accountability.

# Institutional Isomorphism

Nurul Huda Sakib
Department of Government and Politics, Jahangirnagar University, Dhaka, Bangladesh

## Synonyms

Institutional homomorphism; Organizational homogeneity

## Introduction

Institutional isomorphism can be defined as a mechanism where one organization went through some organizational transformation by initiating actions that are similar to other organization in terms of procedure and outlook, but not in the outcome. It becomes a buzz word as World Bank and much more organizations often referred to the term for successful policy implementation, especially in developing countries. The term "isomorphism" (or "isomorphic mimicry") is drawn from biological evolution in which one animal gains survival skills by pretending to have characteristics of other animals in a way that provides that animal with survival value (Pritchett and de Weijer 2011). A central precept of institutional theory is the belief "that organisations sharing the same environment will employ similar practices and thus become 'isomorphic' with each other" (Kostova and Roth 2002). Therefore, the terminology "isomorphism" is very crucial in the context of explaining institutional behavior.

The notion of isomorphism emerged in organizational sociology in the 1970s and 1980s, introduced mainly by Hawley (1968), Hannan and Freeman (1977), Meyer and Rowan (1977), and DiMaggio and Powell (1983). Hawley (1968) found isomorphism to be a "constraining process that forces one unit in a population to resemble other units that face the same set of environmental conditions"(cited in DiMaggio and Powell 2000, p. 146). With the suggestion that the diversity of organizational forms is isomorphic to a variety of environments, he extended the terminology by stating that isomorphism is a productive process as organizational characteristics are modified in the direction of increasing their comparability with environmental aspects (DiMaggio and Powell 1983). Following Hawley (1968), Hannan and Freeman (1977) argued that isomorphism would work in society as organizational decision-makers learn appropriate responses and adjust their behavior accordingly. Meyer and Rowan (1977) tried to understand firms' quest for legitimacy. They argued that the rules set by institutions mainly functioned as myths by which organizations incorporate, gaining legitimacy, resources, stability, and the ability to survive for a longer time.

DiMaggio and Powell (1983) explained isomorphism through two types of isomorphism dynamics – competitive and institutional.

## Competitive Isomorphism

Isomorphism, in a competitive sense, defines that organizations in an environment compete freely and openly. It creates pressure to adopt behavior due to competition (Hannan and Freeman 1977). For example, if one company gives its products in half price on a special occasion every year, then a similar company also follows that principle to remain in the market and provide customer satisfaction. Many neoclassical economists believe that under the condition of the absolute market, competitive pressure creates optimal results (Beckert 2010).

## Institutional Isomorphism

DiMaggio and Powell (1983) mainly explained institutional isomorphism while they were elaborating the two types of isomorphism dynamics, as

I have published the theoretical framework in two of my published paper. For detail see: https://doi.org/10.1080/02185377.2019.1642773 and https://doi.org/10.1007/s41111-020-00143-4

Source: Adapted from Scott 1995, p. 33; Guillén 2014

it is crucial to understand politics, especially in developing countries. They expanded the idea as a social scientist and connected institutions with the structure and behavior of organizations. Institutional isomorphism is a process in which organizations gain increasing similarity in the structure to other organization, but in practice social rules, ideals, and practices dominate the rules of the game of the organization.

DiMaggio and Powell (1983, 2000) argue that organizations copy practices adopted by others to acquire legitimacy. They try to explain why in modern society, organizations tend to be similar and exhibit a sign of homogeneity rather than heterogeneity in their strategy, process, and activities. Thus, instead of seeking variation among organisations in structure and behaviour, the focus should be on investigating why there exists a startling homogeneity among organisations. External organizational forces are crucial to an organization which not only competes for resources and customers but also for political power and legitimacy. In this context, the fundamental mechanisms through which isomorphic change occur is a critical issue.

## Dynamics of Institutional Isomorphism

Institutional isomorphism identifies three processes of constraining influences, namely, coercive, mimetic, and normative isomorphism, to explain why organizations are driven to similarity and seek to maintain their legitimacy (DiMaggio and Powell 1983). These fundamental mechanisms which shape and established structures of three core pillars of enforcement are regulative, normative, and cognitive in operation (Table 1);

## Coercive Isomorphism

The terminology power, pressure, force, or persuasion could be the best way to define coercive isomorphism. In general, homogenization of organization occurs due to pressure or exercise of power from one organization to others. Thus, in coercive isomorphism, actions can be constrained by the effects of other, more powerful units (Mizruchi and Fein 1999). For example, the ADB adopted the Accountability Mechanism due to coercive isomorphic pressure from the World Bank (Park 2014). Thus, coercive isomorphism shaped by government regulation or regulatory agencies engages with organizations. Another example of a powerful organization is the state, as organizations are influenced by rules and legitimized by the state. Coercive pressure shapes through different mechanisms, such as performance evaluation, budgetary control mechanisms, and accounting practices by mother organizations

(Yazdifar et al. 2008). Furthermore, a higher level of funding and personnel dependence creates more influence and imposition (DiMaggio and Powell 1983). Hence, the coercive isomorphism is likely to be the dominant force in the anti-corruption efforts in Bangladesh; it involves interorganizational powers like World Bank, ADB, JICA, and UN.

## Mimetic Isomorphism

In line with institutional organization theory, many scholars have extensively explored mimetic isomorphism as a response to uncertainty as the institution seeks legitimacy (Meyer and Rowan 1977). Mimetic isomorphism suggests that organizations try to copy other successful organizations, particularly in contexts of uncertainty or crisis (Park 2014). According to DiMaggio and Powell (DiMaggio and Powell 2000, p. 149), "when organisational technologies are poorly understood, when goals are ambiguous, or when the environment creates symbolic uncertainty, organisations may model themselves on other organisations." Moreover, in a different model, March (1981) showed that mimetic isomorphism could also be driven by "obligatory action." As many social actors can drive any action, ultimately these actions become familiar, taken for granted, or institutionalized. As a result, other social actors will undertake that course of action without hesitation (Haveman 1993). The mimetic process may succeed through recommendations from donors, public consultations, etc. Thus, although anticorruption efforts in Bangladesh may develop through coercive pressure, the formulation process of that strategy is mainly through mimetic isomorphism. One of the advantages of the mimetic process is there are very few expenses for organizations who face uncertainty and unclear solution. Modelling (as DiMaggio and Powell used the word) other organization activities would provide a viable response to uncertainty. This modelling may be unintentional or indirect through their working process but may lead to innovation. To describe the mimetic process, DiMaggio and Powell provided the example of Japan's modernization process and showed how they were successful following western prototypes.

## Normative Isomorphism

Normative isomorphism suggests that institutions and institutional change can also be the result of attraction from other successful initiatives. DiMaggio and Powell (1983) argued that normative isomorphism is a matter of professionalization as formal education and professional networks lead to the spread of insights, models, and prescriptive rules. Greenwood et al. thus outlined (2002, p. 58) "Professional associations . . . play an important role in theorising change, endorsing local innovations and shaping their diffusion." The reason is that professional bodies receive similar training and interact with professional and trade associations (Mizruchi and Fein 1999). Wouters and Wilderom (2008) also have argued that professionalism positively influences employees' positive perceptions toward a performance measurement system. A professional person has better access to technology and information and can transmit external ideas into their organization with the same cognitive lens. Thus, institutionalists chose normative approach when they adopt policy transfer in developing countries. For example, several normative elements like a seminar, workshop, and training of officials are often organized to make a professional anticorruption body in Bangladesh.

## Studies on Institutional Isomorphism

Many scholars have studied institutional isomorphism extensively. Among these studies, the effect of societal and institutional environment through coercive, mimetic, and normative isomorphism has been widely noted in budgetary control systems, NGO accountability and

nonprofit organizations reporting, the evolution of hospital structure and health-maintenance organizations, the adoption of civil service reform by municipal governments, financial management reforms, organizational structures and management accounting systems, of the multidivisional corporate form, the diffusion of diversification strategies, combating corruption, environment management, and many other sectors. For example, Tolbert and Zucker (1983) found that in the case of civil service, the adoption of a policy or program by an organization is importantly determined by the extent to which the measure is institutionalized – whether by law or by gradual legitimation. Similarly, in the case of the Japanese banking sector, Hussain and Hoque (2002) found several institutional factors like an economic constraint, central bank regulatory control, financial legislation, management's strategic focus, bank size, competition, and tendency of coping best practices that influence the banks to implement performance measurement system. Burns and Wholey (1993) showed that matrix adoption in a group of the hospital is influenced not only by task diversity, but also by sociometric location, the dissemination of information, and the cumulative force of adoption in interorganizational networks. It suggests the importance of cultural setup of any situation to imitate organization. Another notion of the isomorphic pressure from the parent organization is that external constraints limit the choice of an organization due to resource dependence. Thus, they follow the parent organizations' norms and make an influence on both internal and external entry-mode decisions and structures that firms pursue (Davis et al. 2000). In this regard, Park (2014) showed that the Asian Development Bank (ADB) created a new Accountability Mechanism (AM) because of institutional isomorphism. The idea of AM comes from the World Bank, and ADB had to apply it because of the coercive and mimetic isomorphism process. Most of these literature highlight how the institution is controlled by parent organizations and influences institutional behavior. At the same time, some of the writings emphasize the need for balancing institutional control through strategy.

## Limitations of Institutional Isomorphism: Why Fails in Developing Countries?

Institutional isomorphism has several limitations. Notably, the application of isomorphic models in developing countries is someway difficult. Andrews' (2013) explanation is someway interesting as he showed why institutional isomorphism does not work in developing countries. He argued that based on public financial management reform in Africa, the success rate from the institutional changes is 30–60% depending on the situation. Even if the reform occurs, there is only a minimal execution of the law. This is mainly because of three significant causes: context problem, content problem, and an agency problem. The context problem suggests the reforms put by the countries based on donor prescription to deliver the result. However, what you see is not what you want you to get. That is because the context is not fit for those countries. It suggests that "reforms often fail because they do not fit many developing country contexts – looking like square pegs in round holes." (Andrews 2013, p. 2) They failed to provide all the practices required because these reforms were adopted in a short term and limited attention to the context, involve impressive-looking-but-hard-to-reproduce best practice interventions, and emerge through narrow engagements with agents that outsiders consider champions. Such reforms have poor functionality. It is like putting a bunch of laws or changes in a small hole where countries do not have enough capacity to adopt those laws because of political will and other factors like- 'informal institutional content' (Fig. 1).

The second problem he mentioned is the content problem. That is because donors failed to see everything but external, like an iceberg. Donors or reformers see the formal institutional constraints above the waterline and overlook informal institutional constraints below the waterline. However,

**Institutional Isomorphism, Fig. 1** Institutional structures are like icebergs. (Source: Andrews 2013, p. 44; Sakib 2020)

there are certain norms or cognitive belief we do not see as an outsider. Hence, reformers put a lot of attention to the top and make regulative reforms. Thus, informal institutional content contains many constraints. The third problem he has mentioned is the agency problem. It suggests that actors from the reforms party (e.g., The World Bank) face the issues with agency network. There are multiple players in the agency whom the externally defined change agenda is unlikely to resonate normatively (for detail see Andrews 2013).

Similarly, Kostova et al. (2008) showed that institutional isomorphism has limited success due to pressure from the host country as they are restricted to the regulatory and legal domain. In the context of coercive isomorphism, Pfeffer and Salancik (2003) argued that the politically motivated isomorphic pressure might lead to inflexible, repressive, regressive, and less adaptive reforms. It is also found that institutional isomorphism has limited success due to the host country's institutional environment and internal institutional environment (the parent organization) (Davis et al. 2000). However, one criticism of dealing with institutional pressure was given by Christine Oliver (1991) with a detailed model of a strategic response to the isomorphic pressure. She argued that organizations always try to minimize the institutional burden with an appropriate strategic response that is active and consistent to be under a firm's control. She also noted that the strategic response of organizations to institutional pressures is not always the same and organizations may still vary in their strategic behaviors in direct response to these isomorphic pressures. In doing so, institutions try to adopt five types of strategic actions when any isomorphic pressure is put by a parent organization. Table 2 summarizes Oliver's five strategic responses.

Out of the five types of strategy Oliver (1991) mentioned, manipulation is the most active strategic response to organizations toward institutional pressures because in any institutional pressure manipulation can change and normalize the other organization's power to control and impose them further pressure. In addition to these strategic responses, she also mentioned five antecedents responsible for the adoption of strategic behavior. These are cause, constituents, content, control, and context. The precursors discussed above have a substantial influence on the five strategic responses (Canning and O'Dwyer 2013).

**Institutional Isomorphism, Table 2** Typology of strategic behaviors in response to isomorphic pressures

| Strategies | Tactics | Examples |
|---|---|---|
| 1. Acquiesce | Habit | Following invisible, taken-for-granted norms |
| | Imitate | Mimicking institutional models |
| | Comply | Obeying rules and accepting norms |
| 2. Compromise | Balance | Balancing the expectations of multiple constituents |
| | Pacify | Placating and accommodating institutional elements |
| | Bargain | Negotiating with institutional stakeholders |
| 3. Avoid | Conceal | Disguising nonconformity |
| | Buffer | Loosening institutional attachments pressure |
| | Escape | Changing goals, activities, or domains |
| 4. Defy | Dismiss | Ignoring explicit norms and values |
| | Challenge | Contesting rules and requirements |
| | Attack | Assaulting the sources of institutional pressure |
| 5. Manipulate | Co-opt | Importing influential constituents |
| | Influence | Shaping values and criteria |
| | Control | Dominating institutional constituents and processes |

**Source:** Adapted from Oliver (1991, p. 152), (Sakib 2020)

## Conclusion

The three types of institutional isomorphic dynamics and relevant study discussed in this entry suggest that countries having a competent structure might be well benefited by adopting isomorphism. However, countries with minimum structure and lack of intensity to take policy are likely to fail through institutional isomorphism. The limitations of the isomorphism also show that institutional constraints occurred during policy implementation had dealt with an unexpected circumstance like policy manipulation, compromise with the stakeholders, avoidance, etc. They also had to face insider constrain. Therefore, mimicking in developing countries often does not bring sweet fruits. Hence, these remain mostly a ceremonial adaptation.

# Institutional Logics in Zambian Public Accountability Organizations

James Hathaway
Research Advisor at NLA University College, Bergen, Norway

## Synonyms

Cultural symbols; Institutions; Norms; Organizational practices; Rationalities; Values

## Definitions

Institutional logics are coherent sets of values, principles, and practices that shape the way actors understand their world, what they value as important, and how they plan to act.

## Introduction

Since its introduction by Friedland and Alford (1991), the institutional logics perspective has become an important inspiration for research on organizations in various contexts. The past decade has witnessed an explosive rise in articles and conference presentations on institutional logics, with nearly all of them focused on contexts in the Global North (Johansen and Waldorff 2017). Only recently has the perspective been applied in the Global South as a way to understand the outcomes of reforms and development initiatives (Andrews 2013) and the change processes within public accountability organizations in Zambia (Hathaway and Askvik 2020). By using an institutional logics perspective in these contexts, this entry provides insights on how government bureaucracies are organized, how civil servants should behave and be evaluated, and the basic values and norms organizational actors should follow while carrying out their work.

Institutional logics are here understood coherent sets of values, principles, and practices that

shape the way actors understand their world, what they value as important, and how they plan to act. This perspective offers a path toward understanding individual and organizational behavior within their social contexts, since actors can draw on different institutional logics that provide meaning to their world, and they can also manipulate and elaborate on those different logics in novel ways to change social relations in society. Central to this perspective is the idea of embedded agency, since the logics within society shape the actions of individuals, while at the same time those logics can provide opportunities for organizational change through individual or collective agency.

Research on institutional logics often uses typologies as a systematic way of examining the logics within a society. This helps order data collection and theorizing since the ideal types serve as stable points for making empirical comparisons. Friedland and Alford (1991) presented the first typology of institutional logics within what they called "contemporary Western societies – capitalism, family, bureaucratic state, democracy, and Christianity" (Ibid, p. 249). Others have built upon this original work to develop typologies for empirical research, most notably, Thornton et al. (2012), who considered that societies are comprised of the following logics: family, community, religion, state, market, profession, and corporation. Still, other studies have focused on specific sectors of society, such as that by Meyer and Hammerschmid (2006), which examines the legalistic-bureaucratic and managerial logics in the Austrian civil service.

Despite the various typologies that have been developed in "Western" contexts such as these, there had been a gap in the literature related to the Global South until recently. Hathaway (2019), while conducting empirical research on Zambian public accountability organizations, found that these existing conceptualizations did not fit the local context in Zambia and set out to develop a new typology. The process of developing the new typology followed the adaptive theory approach and is described in detail in the article by Hathaway and Askvik (2020). The typology from Hathaway and Askvik (2020) is summarized below along with a discussion of how it is useful for research on public accountability organizations in Zambia.

## Presentation of Four Ideal Types of Logics

### The Kinship Logic

The first logic in the typology is the kinship logic, which is an informal type of logic based on mutual obligations between individuals. The values and practices of the kinship logic have existed for several millennia on the African continent along with the long-standing communitarian approach to life in which familial and tribal relationships are important ways for needs to be met in society. This way of life has been described as "primordial" by researchers such as Hydén (2013) and Masunungure (2004), since it has existed on the African continent for thousands of years, certainly long before colonists arrived. Within this approach to community life in Africa, actors are thought to "share expectations about what is appropriate behavior: that is, reciprocity in all exchanges" (Hydén 2013, p. 87). In that way, needs are met whether in times of scarcity or times of abundance.

Scholars such as Hydén (2013) and Masunungure (2004) have contended that one of the central problems facing African public administration today is the tension that exists between this informal and primordial way of getting things done and the more abstract civic professionalism within government administrations. This is because within the kinship logic there is no distinction between private and state resources. Thus, state resources may be distributed as favors in exchange for fealty, and patrimonialism is practiced and tolerated under a kinship logic. The kinship logic has its own basis of rationality in the sense that it "presupposes personal interdependence" between members across all levels of society (Hydén 2013, p. 86). As Friedland and Alford (1991) described this interdependence, "Through gifts, the lower status persons take possession of powerful persons whose substance they have penetrated with their own. . . Individuals make use of the institutional logic of kinship to penetrate the state definitions of

needs and social categories" (p. 259). In this way, the kindship logics can subvert more formal institutional logics and their ways of determining what is appropriate, and it can be used to get things done outside of those logics. This can be commonly seen in practices such as payouts or bribes, the hiring or promoting of civil servants based on tribal affiliation, or the granting of other types of benefits based on interpersonal relationships or exchanges of favors as opposed to being based on formal operating procedures.

### The Bureaucratic Logic

The second logic in the typology is the bureaucratic logic, which is based on bureaucratic organizing principles. Central to the bureaucratic logic are the ideas of hierarchy, standardized work routines, and stability. In this way, organizations are seen metaphorically as machines that perform routine tasks with standard and efficient outputs. This logic also assumes that organizational outputs should be regulated and formalized, as opposed to the informality of the kinship logic described previously. In that way, an organization guided by a bureaucratic logic would be "characterized by a strong emphasis on processes, rules, and. . . impartiality" (Meyer and Hammerschmid 2006, pp. 1002–1003).

Bureaucratic organizing principles developed over centuries in Europe as a response to personalized rule (Hydén 2013) and as a means of standardizing workers' output during the industrial revolution. It later arrived in Zambia with the British South Africa Company in the early 1900s as a way organizing tax collection, copper mining operations, and exerting British control over African labor. This oppressive history has led to a sense of mistrust of bureaucratic systems in Zambia and throughout Africa. However, bureaucratic ideas, practices, and structures are still present in organizational life in Zambia, both in public and private organizations.

### The Development Management Logic

The third ideal type, the development management logic, is based on private sector approaches to development processes. Development management is a contested term in society and in research today because it can reinforce power disparities between North and South. The terminology itself signals an idea that societies in the Global South are not yet modern or self-sufficient enough and that they therefore "need 'development'" (Cooke 2004, p. 604). The term can also convey that "management" is somehow a neutral instrument rather than a tool of domination and control wielded by those in roles of power. However, much as Thomas (1996) argued in early conceptualizations of "development management," this typology takes the concept at "face value" (Cooke 2001, p. 13) for the purpose of making comparisons with the empirical data.

In a development management logic, the espoused mission of the organization centers around the empowerment of society and its marginalized groups and, in that way, it takes a normative stance on development and empowerment of the poor and marginalized in societies (Brinkerhoff and Coston 1999). This aspect of empowerment makes the development management logic different from the "managerial logic" presented by Meyer and Hammerschmid (2006), for example, and managerialism more generally. Inherent in development management is societal empowerment and good governance for the citizenry, particularly for the disempowered and vulnerable. Therefore, the development management logic's values and practices are centered on bringing measurable results for all members of society and, in particular, those who are poor and disenfranchised. The principles and practices found in the development management are also more recent arrivals to Africa, coming after bureaucracy, and are often embedded within the goals, measures, and project plans of donor organizations and NGOs. Therefore, the development management logic is often prominent in accountability-related issues and public accountability organizations.

### The Professionalism Logic

The fourth logic in the typology is the professionalism logic, which is useful to consider in the context of Zambia. Zambia has seen a marked increase in professional training and the establishment of professional organizations since the 1980s, which has impacted the civil service. This

is also seen in some other parts of the Global South and has received attention from other researchers such as Grindle and Hilderbrand (1995) and Gustavson (2014), who have called for a new emphasis on the role of professionalization in the South. This research has shown that civil servants who see themselves as professionals and who strive to uphold professional standards can have a positive impact on their organizations. This is because the values consistent with the professionalism logic emphasize education and the improvement of skills within the occupation, and furthermore, it is contended that having a professional work ethic tends to motivate individuals in ways that monetary reward alone cannot.

When organizations are organized according to the professionalism logic, they are coordinated and controlled by fellow professionals. It is, therefore, individuals from within the professional community that fill executive and management positions and who lead the organizations.

**Institutional Logics in Zambian Public Accountability Organizations, Table 1** Typology of institutional logics in Zambian public accountability organizations

| Dimensions | Kinship logic | Bureaucratic logic | Development management logic | Professionalism logic |
|---|---|---|---|---|
| Collective identity | Affiliation with tribal and ethnic groups | Affiliation with the bureaucracy | Affiliation with shared mission of the organization to serve society | Affiliation with the professional community |
| Staff orientation | Orientated toward kin, community, and patriarch | Internal orientation within bureaucratic organization | External orientation toward public | Oriented toward professional field |
| Core values | Relationships: reciprocity, serving one's own needs and those of family and tribe with loyalty | Rules: following rules and correct procedures in a stable environment | Results: achieving measurable results, efficiency, effectiveness for society, especially the disempowered | Reliability: being skilled in and following professional norms, standards, and methods; maintaining professional work ethic, autonomy |
| Preferred org. structure | Patriarchal structure | Centralized hierarchical structure | Fragmented structure, team & project based | Decentralized hierarchical structure |
| Operational mode | "Personal fiefdoms" with no separation between private and public resources | Mechanistic and geared to rules and routines | Organic, strategic, and flexible to meet the needs of the public | Pigeonholing processes: diagnosis and application of program; discretionary judgment |
| System of control | Informal control based on expectations of reciprocity and/or fear | Rule-based, with strict formal control by centralized authority structure | Managerial control based on performance measurement | Professional autonomy, guided by norms and standards |
| Source of authority | Informal authority | Rational-legal authority | Managerial authority | Professional authority |
| Evaluation criteria | Elevating status with community; showing and sharing personal wealth | Following proper procedures; providing stable, consistent service | Achieving performance goals and targets | Delivering professionally sound and reliable work by following professional standards and methods |
| Employment practices | Entry to employment and promotions based on personal favor and connections | Entry to employment through centralized system. Promotions based on seniority | Entry to employment and promotions based on ability to bring results and performance | Entry to employment and promotions based on professional certifications and knowledge acquisition |

Typology of institutional logics in Zambian accountability organizations, Hathaway and Askvik (2020)

Occupational roles within the professionalism logic are fixed in ways that allow professionals to fill the same types of roles in other organizations within the same field (e.g., a lawyer moving from one firm to another). This also contributes to a professional worker's allegiance to the profession instead of to the employer. Formal and specialized knowledge are important and central within this logic, as they are a source for professional identification and pride that professionals often share.

## Conclusion

The values and practices that are consistent with the four logics in this typology each have an influence on accountability organizations in Zambia. They offer competing alternatives for the way that public accountability organizations are organized, the decisions that are to be made, and the ways that organization members view themselves and others. More details on each of the institutional logics in the typology are presented in the Table 1. This provides what Johansen and Waldorff (2017) call the vertical relationships within each logic – the varying institutional dimensions within each of the logics that are critical for evaluating institutional contexts (Campbell 2004). These dimensions include, for example, "collective identity," which plays a critical role in actors' behavior when they see themselves as members of a particular group or collectivity. They also include the core values associated with each logic, based on factors such as family relationships, rule structures, results frameworks, and professional norms. These dimensions affect decision-making processes and organizational behavior within public accountability organizations.

Using an institutional logics perspective in research on public accountability organizations is useful because it provides a systematic way of looking at the organizations and the conflicts that can exist between multiple sets of organizing principles, practices, and ideas that influence organizational actors and the power struggles that can take place. This is particularly relevant in public accountability organizations that play an increasingly important role in development processes (Andrews 2013). Within these organizations, there are often political power struggles related to guiding principles, ideas, and control systems consistent with the four logics in the typology. This perspective can also be used for tracking change processes within the organizations, which is an "uneven process where change in one dimension may lag another" (Campbell 2004, p. 39). For example, an organization might adopt *evaluation criteria* that are consistent with the development management logic while maintaining *core values* that are more consistent with a bureaucratic logic. The organization could eventually change to adopt the development management logic's values, or it could remain a type of hybrid with aspects of both logics. The institutional logics perspective and the typology with the four logics could help measure these aspects in ways that allow for the type of complexity that often exists in public accountability organizations.

# Institutional Organization of the Chilean National Congress

Ricardo Gamboa[1] and Andrés Dockendorff[2]
[1]Institute of International Studies, Universidad de Chile, Santiago, Chile
[2]Department of Government, University of Essex, Colchester, Essex, UK

## Synonyms

Legislative branch – assembly

## Definition

The Chilean Congress has achieved a high degree of institutionalization since the country's democratic restoration in 1990. It has a consolidated internal structure and plays a central role in the political system in exercise of its own functions, which indeed have increased over time. Even so, for political and institutional reasons, its capacity for influence is less than that exercised by other assemblies in advanced democracies.
Section: Latin America and the Caribbean.

## Introduction

Legislatures play a central role in all democracies, mainly by exercising functions of legislation, oversight, and representation. In this context, there is extensive academic research into democratic assemblies analyzing various aspects of its place within the political system. In the case of Chile, observers have noted the great capacity of its Congress to influence the policy making process when compared with the scenario of many Latin American countries (BID 2006). For example, the Parliamentary Powers Index provides information consistent with the aforementioned, situating Chile in a relatively high position in Latin America, but below advanced democracies like Germany, the United States, or Denmark (Fish and Kroenig 2009). Despite a favorable international ranking, it is one of the institutions ranking lowest in indices of confidence among the population (CEP 2016).

In view of this, it is essential to examine Congress organization, functioning, and its role in the policy making process, both to understand its role in the political system and to analyze if it carries out its functions effectively (or not). The present article seeks to contribute to this discussion. This article is divided into the following sections: first, the composition of the Congress is described. Second, how it is organized is explained. Third, the main functions of the Chilean assembly are described and analyzed. Finally, the role of Congress in the Chilean political system is briefly discussed.

## Composition of the Congress

Since 1822, the Congress has had a bicameral structure similar to various other countries in Latin America (e.g., Argentina, Brazil, Colombia, Mexico, and Uruguay), in a region in which bicameralism has a long history (Llanos and Nolte 2003). Congress is composed of the Chamber of Deputies (CD) and the Senate. The CD has 120 deputies and the Senate 38 members. The deputies hold their seats for 4 years and senators for eight. Parliamentary elections coincide with presidential elections. Thus, every 4 years the entire Chamber and half of the Senate are renewed. Both senators and deputies can be reelected indefinitely.

For the election of both chambers the so-called "binomial system," almost unique in the world, was used from 1989 until 2013. According to this system, each district to elect deputies (60 in all) and each senatorial constituency (19) has a magnitude of 2. (Between 1990 and 2006, the number of senators varied between 47 and 49, due to the existence of nonelected senators (of which there were nine, appointed by different institutions) and senators for life (former presidents who had held office for more than 6 years). Nonelected senators figure was eliminated in 2005.) Each party or electoral pact comprising two or more parties could present a list of up to two candidates per district or constituency. Electors voted for one candidate. The D'Hondt formula was applied to determine who was elected. Thus, it happened that if the most voted list received more than double the votes of its nearest competitor, both members of the list were elected. If this was not the case, those candidates were elected who had the most votes of the two most voted lists.

Beginning with the elections of 2017, the rules will change due to the 2015 electoral reform act (Law 20,840). First, this reform increased the number of deputies to 155 and of senators to 50. Second, the number and magnitude of districts and senatorial constituencies were changed. In the case of the CD, the number of districts was reduced to 28, each with a magnitude of between 3 and 8 seats. In the senate, there will be 15 constituencies, each of which will elect between 2 and 5 senators. In both cases, the D'Hondt formula will still apply to determine who is elected. Third, a gender quota was introduced, according to which of each party's list of candidates those of the same sex cannot be more than 60% of the total (Gamboa and Morales 2016).

## Internal Organization

The internal organization is regulated both by the Organic Constitutional Law of Congress (Law 18,918) and the standing orders ("*Reglamentos*") of each chamber. These deal with the establishment of the various internal bodies that structure the work of each chamber, as well as bureaucratic organization.

### Chamber Directorates

At the start of every legislative period (March 11 following the most recent election), each chamber elects a governing body or Chamber Directorate ("*Mesa*"). The CD's Directorate comprises a president and two vice-presidents, each of whom is elected by majority (CD Standing Orders, Article 44). In the Senate, the Directorate consists of a president and a vice-president. Formally, they are elected for a single legislative period (4 years). However, since 1990 the practice has been to reach an agreement at the beginning of each legislative session on the distribution of the members of the Directories of both chambers as well as the chairs of the legislative committees (see below). Both change every year. (For example, for the 2014–2018 period, the ruling New Majority (Nueva Mayoría) governing coalition which dominates both chambers, agreed to distribute the leadership of the CD and the Senate between its main parties for the duration of the entire period. Thus, every year the leadership of the chambers switches between members of different New Majority parties.)

The CD's president directs its sessions and keeps order in the debate of legislative bills and of the Chamber's declarations and resolutions. (The first part of each session is dedicated to the discussion of legislative bills. After that, chamber declarations (*proyectos de acuerdo*) are debated,

and sessions end with the Hour of Incidents (see below).) The president must also decide on the admissibility of legislative bills (whether they are consistent with the Constitution or otherwise, a decision that can be revoked by the plenary). The Chamber Directorate is also competent to name legislative committee members (according to the agreements reached by the party caucuses), to declare matters secret, to establish what subjects need to be dispatched immediately or fast-tracked, and to formulate the draft bill for the corporation's budget. The Directory is permanently assisted by the General Secretary of the Chamber of Deputies.

In the case of the Senate, the president chairs the debates in the plenary sessions and organizes the discussion of matters the corporation must examine. According to the standing orders, the president also has powers to summon and preside the Senate's sessions, keep order, declare a session secret, and uphold the corporation's relations with other State institutions. The Senate's Directorate is assisted in its functions by the General Secretary of the Senate.

According to information obtained from interviews with key informants, the Chamber Directorates do not actually function in a collegiate manner. Rather, their decision-making power is concentrated in the president, who also has significant leverage in administrative actions.

## Party Parliamentary Groups

After the Chamber Directorates, the Party Parliamentary Groups (caucuses or "*bancadas*") are of great relevance in the organization of Congress. In the Senate's case, they are the "communicating organs" between the Chamber Directory and the plenary for all matters submitted for its consideration (Senate Standing Orders, Article11). Regardless of the number of members it may have, each party may constitute a parliamentary group. Likewise, three independent senators may form a parliamentary group. Parliamentary group meetings are the forum in which representatives negotiate and reach agreements on how and in what form Senate business should be conducted (Article 16).

In the CD, all deputies must be members of a party parliamentary group. Each party forms a parliamentary group by every nine of its members. Thus, each party may have more than one parliamentary group. Taken together, all the committees make up the party caucus of each chamber. If a party cannot meet the minimum number of nine members, it may incorporate members of other parties to do so. Independent deputies join to form an independent parliamentary group (CD Standing Orders, Article 55). The parliamentary groups function is to expedite the work of the Chamber (CD Standing Orders, Article 1). In this way, for example, a meeting of parliamentary groups decides how the various matters included in the *Order of business (Tabla)* of the respective sessions must be dealt with (e.g., if something is to be considered of "easy dispatch" or not), or also those that relate to the CD's international policy. Despite the foregoing, the action of parliamentary groups is limited in that the law establishes obligatory norms for the definition of what each chamber must deal with in its sessions (i.e., the issues included in its Order of business). The executive branch can also influence such decisions by its power to declare decisions on legislative bills to be "urgent" (see below).

The internal coordination of the parliamentary groups is not formally regulated. According to information obtained from interviews with legislators and officials, so-called *caucus lunches (almuerzos de bancada)* are a central feature of their functioning. These informal meetings are directed by the caucus chair or vice-chair, and most of the legislators are normally present. They take place twice a week, on Tuesdays and Wednesdays, and are the occasion on which each caucus's political position on legislative bills, as well as the legislative agenda, is discussed and decided.

## The Bureaucracy

The general secretaries of the Senate and the Chamber of Deputies are the top administrative authority or senior head of each corporation and responsible for administering their services and staff. The law and the standing orders establish also the conditions for the entrance and promotion of officials within the structure of each Chamber, leaving limited room for political discretion in the appointment of officials.

In the case of the Senate, the law provides for a total of 220 permanent staff, while in the CD they are 284, distributed in different grades or categories. The Library of Congress, which is responsible for providing legislative assistance to senators and deputies, has 125 permanent staff, who report to its director. In addition there are at least as many temporary staff on contracts; in 2016 there were 139 in the CD.

## The Functions of Congress

### Common Powers: The Congress in the Legislative Process

The Chilean constitution attributes exclusive powers to each chamber and common powers to both. Among the latter, their participation on the legislative process (Article 46) is first and foremost. Second is their power to approve or reject international treaties the president may present for their approval, before these can enter into force. Legislators may not introduce amendments to the text of a treaty, but it may suggest formulating reservations or declarations interpreting the treaty. Finally, both chambers must vote to accept or reject states of constitutional emergency (states of siege and assembly) declared by the president of the republic (Article 54, Nos. 1 and 2 of the Constitution of the Republic of Chile, CPR).

The main actors in the legislative process are the executive branch and the Congress. The process begins with the introduction of a legislative bill, either by the president or by one or more parliamentarians (not more than ten in the case of the CD, or five in the Senate) (Art. 65 CPR). Bills proposed by the president are referred to as "messages," while those presented by parliamentarians are known as "motions." (In Chile there is no provision for citizens' legislative initiatives.) The CPR also establishes that the president has exclusive powers to initiate legislation on certain important matters (Art. 65). (Examples of matters on which the president enjoys sole right of initiative are: the political and administrative division of the country; the creation, modification and elimination of taxes; the creation of public services; social security and collective bargaining laws; and the financial administration of the state. For details, see Cea (2013).) This means that parliamentarians may not present bills on these matters or propose amendments to bills dealing with them, except to approve or reject the proposals or reduce the spending whose introduction is proposed (Law 18.918, Article 24).

The law-making process, in general, is as follows. Once presented, a bill is discussed in the respective chamber, which is referred to as the "chamber of origin." If declared admissible (and unless it is approved immediately in one of the chambers), as a rule the bill has two readings in each chamber, a general one and a detailed one. Thus, every bill is first discussed by one or more of the permanent committees established to study proposed legislation. (In the majority of cases, it is one. Exceptionally, two committees are asked to review it, either separately or jointly. Also, special committees may be created. In every case, bills involving public expenditure must pass through the Treasury Committee (Law No. 18,918, Article 18).) In the CD there are 25 (with 13 members each) and in the Senate there are 19 (with five members each). The committee or committees first examine a bill "in general" and recommend that the plenary approve or reject it. The latter then decides whether to approve or reject the bill "in general." If it approves it, it is sent back to the committee or committees for a discussion "in detail" (second reading). At the end of the discussion, a second report is issued and discussed by the plenary, which finally decides whether to accept or reject the bill. If it approves it, the bill is passed to the other chamber, where a similar procedure is followed.

The quorum for a law's approval varies according to the law in question. In the case of laws that interpret the constitution, the quorum is three-fifths of the senators and deputies holding office. The quorum for the approval of organic constitutional laws is four-sevenths, while an absolute majority is required to approve laws requiring a special quorum (*quorum calificado*) (Article 66). (The constitution stipulates what matters must be regulated by an organic constitutional law. Chief among them are: the organization and powers of the courts, of the

Constitutional Court, the Central Bank, the electoral system, and the political parties. The same is true of laws requiring a special quorum (e.g., those authorizing the state to engage in an economic activity).) For all other laws (so-called simple laws), the quorum is a majority of the deputies and senators present. (Parliamentarians holding office are all those who are members of Congress except for those who have been stripped of their parliamentary immunity or are out of the country. The chambers can sit with a third of their members plus one, that is, with 41 deputies and 13 senators. Consequently, to pass an organic constitutional law (if all parliamentarians are in exercise of their functions), the votes of 69 deputies and 23 senators are required. If a simple law is involved, on the other hand, and there are only 60 deputies and 24 senators, the vote of 31 deputies and 13 senators is sufficient.) Once a bill has been approved in each of the chambers, it passes to the president of the republic, who can approve it or veto it. In the case of a veto, in order to reject the veto and insist on the original text, the Congress need the affirmative vote of two-thirds of the legislators in each chamber.

Some comments may help to understand better the dynamics of the legislative process. First, every law must be approved by parliament before its promulgation. Unlike other countries such as Argentina or Brazil, there is no mechanism enabling the executive branch to dictate unilaterally norms with the status of laws. Second, during the discussion of bills, both legislators and the executive branch may present proposals for amendments (subject to the limitations mentioned above with regard to the president's exclusive competence), which are known as *indicaciones*. Third, except in the case of the budget laws, (This law, which is annual, has a different procedure. The president has to present the bill at least 3 months before it must become law (on January 1 of each year), and if Congress does not decide on a bill within 60 days, the version presented by the president prevails.) parliamentary deliberations are not subject to any time limit. Despite this, the executive branch may declare bills consideration to be a matter of urgency, in which case the respective chamber may have to comply with a fixed deadline (of 30, 15, or 6 days) to reach a decision on a bill. However, failure to meet the deadline does not imply the bill's approval (Law 18.918, Article 26). Fourth, during the discussion in the committees, experts and other organizations that wish to express an opinion on a bill may formally participate – access is open. Fifth, even though the plenary has the final word on bills, the key decisions on their content and whether they progress or not are taken in the specialized committees. In this context, the committee chairman plays a key role, as in practice her favorable disposition is a vital factor in the progress of a bill. This is why the choice of the committee chairman (especially the main ones like the Treasury and Constitution Committees) is part of the negotiations between party caucuses. Sixth, should the chambers differ over the contents of a bill, the constitution provides for the formation of "joint committees," composed of an equal number of senators and deputies, whose job is to propose a path to resolve the differences between the chambers. In practice, this has been the main mechanism for resolving legislative clashes between government and opposition (in 23 of the 26 years since 1990 the government coalition has not had majority in both chambers).

Between 1990 and 2016 Congress discussed 10,905 legislative bills, of which 2748 (25.2%) were "messages" and 8157 (74.8%) were "motions." However, when we look at the approval rate of bills as opposed to their origins alone, the comparison is reversed. 73.5% of the 2676 laws approved since 1990 originated with messages, while only 26% originated with motions. In other words, only 8% of the motions actually became law. These data clearly speak to the powerful leverage of the executive branch in the legislative arena.

In the final analysis, Congress can be stronger than these figures would lead one to expect. Recent research has shown that parliamentarians use informal resources to increase budgetary allocations and to relocate resources (Arana 2015). There is also evidence that Chilean legislators use informal contacts with the executive to influence the prelegislative phases of bills (Ferraro 2008).

### Exclusive Powers: The Chamber of Deputies as an Oversight Body

The CD has two exclusive powers. The first is to oversee the actions of government, for which it has three main instruments: (a) to create committees of inquiry (CI) to gather information on specific government actions, for which it needs the vote of two-fifths of the deputies, and (b) to adopt chamber declarations to be transmitted to the president, who must respond through the respective minister within 30 days. In addition, any deputy may request information from the government with the vote of one-third of the deputies. Finally, (c) to put questions to government ministers, that is, summon them to appear to respond to questions about matters on their watch. For this, a vote of one third of the deputies is required (Article 52). (This power was introduced in 2005.)

Its second power is to determine whether to proceed or not with impeachment proceedings against government authorities. The constitution establishes exhaustively which authorities are subject to impeachment, the grounds on which such proceedings can be based, and the quorum needed to approve them. For example, the president can only be impeached for actions of his or her administration that have seriously compromised the honor or security of the nation or have seriously infringed the constitution or the law (Article 52). The quorum for approval is an absolute majority of the deputies in office.

Of the oversight mechanisms available to the CD, its committees of inquiry (Until the 2005 constitutional reform the constitution did not recognize committees of inquiry. However, many of them were created after 1990, based on the Standing Orders of the CD.) are the most visible and have the greatest public impact, as well as a long tradition in its history. They consist of 13 members (CD Standing Orders, Article 313) and the CD defines their objectives and purpose when it agrees to form them. To carry out their work, these committees can order the appearance of ministers of state and public officials as well as the staff of public enterprises. Summonses and orders for information can be issued with the agreement of one-third of the members of committee. A committee can also invite private actors to attend, although they have no obligation to do so.

Between 1990 and 2016, 169 committees of inquiry were established. Their number varied by year, averaging 6.5 over the period. In 2016 19 were formed, the highest number since 1990. (Among those created in 2016 were the committees charged with investigating errors in the electoral register for the municipal elections of 2016; irregularities in the tendering of hospitals; compliance with the Directorate of Labor norms on trade unions, among others.) The duration of commission mandates varied during 2016, giving them 30 to 180 days to carry out their work. (Information obtained from https://www.camara.cl/trabajamos/comisiones_tipo.aspx?prmT=I visited on January 17, 2017.)

Finally, regarding the questioning of ministers, since 2006 16 ministers have had to appear before the CD to answer questions. (Information obtained from the official Chamber of Deputies website. https://www.camara.cl/trabajamos/comision_interpelacion.aspx) In practice in the great majority of cases such questioning has had no concrete political repercussions.

In view of this, the efficacy of these mechanisms has been queried. To date, no systematic study has been carried out to evaluate the oversight capacity of the CD, even though its limited capacity has been underscored (PNUD 2014). A key aspect to consider is that the instruments described above lack any powers of sanction. Thus, for example, even when they conclude that some authority broke the law, the committees of inquiry cannot impose sanctions. Another fact that reflects the limitations of the powers described above is that between March 11, 2015, and March 10, 2016, the CD issued 10,151 requests for information from the government, of which only 5560 received replies, leaving 4.561 awaiting a response (Chamber of Deputies 2016).

### Exclusive Powers: The Senate in the Political System

The Senate has greater exclusive powers, which give it more leverage in the political process. Among the most important (CPR, Article 53) are: (a) to hear impeachment proceedings approved by the Chamber and to pass final

judgment on the guilt of the accused. If the accused is found guilty, he or she is removed from their position and may not be designated or elected for any public office for 5 years; (b) Decide on the loss of civil immunity of ministers of state; (c) rule on questions of competence between administrative authorities and the courts; (d) Declare the incapacity of the president for reasons of physical or mental disability, as well as allow or reject the president's resignation should he present it; and (e) Intervene in the appointments of various authorities.

This last attribution gives the Senate a substantial source of power within the political system, placing it in a superior position to the CD. (This is mainly because the Senate's other powers are little used and have no major political impact. The main exception is its mandate to rule in impeachment proceedings, which at any rate have been infrequent. Since 1990 21 have been launched, of which three have been approved. Two of them ended with the dismissal of ministers of education (in 2009 and 2013). We are grateful to Cristina Escudero for this information.) For example, it falls to the Senate, on a vote of two-thirds of its members, to approve or reject the president's nominations for the appointment of the attorney general, Supreme Court justices, the comptroller general of the republic, and the councilors of the Central Bank and of the Electoral Authority, among others. Moreover, it appoints four of the 10 members of the Constitutional Court (two of them from candidates nominated by the CD). (On this point, it is important to note that since 1990 several reforms have increased the Senate's intervention in the appointment of authorities, and thereby its influence in the political system (Berrios and Gamboa 2006).) In this context, from 1990 until 2013 134 nominations were submitted for Senate approval, of which 119 were approved.

Thus, given the high quorums required for the approval of nominations to top posts in the decision-making process, the executive branch must establish a broad system of political agreements with the Senate, which gives this body a substantial level of influence in the political system, greater than that of the CD (PNUD 2014).

## Congress and Its Representative Functions

Different types of activity are involved in the representation of voters. Some are carried out outside Congress and are unregulated, such as direct contact with voters (constituency work) or press activities. Others, on the other hand, can be carried out in Congress by using the spaces the institutional framework provides. In the Chilean case, these are basically two: introducing legislative bills and presenting the problems of groups or territories to parliament and other authorities.

With regard to the first instrument, data available for 2002–2006 show that only a marginal percentage of the bills presented by deputies have a specific territorial or district reference (Marenghi 2009). Moreover, as indicated previously, deputies' powers to initiate legislation are limited and their bills have a small probability of becoming law. In this sense, this instrument has limited scope.

The second space is the so-called *Hour of Incidents*. A total of 1 h per week is allotted to this activity, (The time allocated to each party or parliamentary group is proportionate to the number of deputies it has. The party or parliamentary group then divides this time between its deputies, as it seems fit.) in which parliamentarians may raise any issue they wish with the Chamber, making it a useful instrument for their function as representatives, especially of their own constituents. Although the subject been little studied in the Chilean case, recent research shows that that is indeed the case: of 1374 interventions in the Hour of Incidents between 1998 and 2014 (approximately 8% of the total), 53.4% were made to raise issues of local importance (Gamboa and Toro 2017). Another study has demonstrated that legislators from electoral districts more distant from the capital tend to use this procedure more frequently (Alemán et al. forthcoming). It should be pointed that these interventions are normally accompanied by a request that the authority concerned (usually a minister), intervene by adopting measures to deal with the problem in question. There is no systematic information on the effectiveness of these

interventions in practice in terms of the actions taken in response to them. However, informal interviews with members of Congress coincide in suggesting a low response rate by the executive.

## The Place of Congress in the Political System

An overview of the role of the National Congress in the political system offers inconsistent perspectives. On the one hand, the Congress exhibits a high degree of institutionalization in organizational terms. Since 1990 its internal organs (Chamber Directorates, *caucuses*, committees, and the internal bureaucracy) have consolidated themselves and developed a way of working that seems suited to the functions entrusted to them. Moreover, the actors involved attach value to these bodies. Added to the above, the Congress has continued to strengthen its position in the system (mainly through the appointment of authorities in the case of the Senate) and oversight activities in the case of the Chamber.

On the other hand, if we concentrate on the legislative function, the Chilean system reveals a situation of imbalance between the executive and legislative branches, in favor of the former. Even though this has not led to cases of legislative gridlock or paralysis, its origins lie in the institutional system, which provides the executive branch with a set of instruments to exert influence over the legislative process at Congress's expense. At the same time, however, a thorough evaluation on this point requires more study of the informal mechanisms of influence available to members of Congress, as well as mechanisms of cooperation between government and opposition. The latter is particularly important given that since 1990 and for a large part of the period analyzed here, the different governments have not enjoyed a parliamentary majority.

Equally, even though research on the issue is sparse, legislators enjoy few instruments to exercise from Congress their functions as representatives. What's more, the existing mechanisms are not necessarily effective.

In synthesis, the Congress is a consolidated institution within the Chilean political system. It plays a significant role in determining public policies, despite its reduced powers when compared with the executive. To alter the imbalance between the legislative and executive branches would require a reform of the political system that could only be achieved by a profound constitutional change. This has been a source of debate since the restoration of democracy, as well as of proposals by some political parties.

# Institutional Racism and the Public Sector

James D. Ward
School of Public Affairs and Administration, Rutgers, The State University of New Jersey, Newark, NJ, USA

## Synonyms

Color-blind racism; Hidden racism; Paternalistic racism; Structural racism

Institutional racism may be defined as "an indirect and largely invisible process which can be compared with cloning and the glass ceiling," according to A.J. Price (1997). "It is a term encompassing the, often unintentional, barriers and selection/promotion procedures which serve to disadvantage members of ethnic minority groups."

Braham et al. (1992: 106) goes a step further and suggests that widening our definition of discrimination to include indirect or *institutional* racism gives a much better understanding of the barriers faced by ethnic minorities. Institutional racism, he asserts, is virtually unrecognized by organizations but is an extremely contentious issue in the public sector.

Dominelli (2002: 157) writes that it is often the veiled presence of racism in everyday activities, which coincides with the failure to make connections between the various incarnations of racism (personal, institutional and cultural), which results in the inability of white people to pinpoint its existence and thus take corrective action.

Halstead (1988) postulates institutional racism as the manner in which institutional arrangements and the distribution of resources shape the advantages of white society. More specifically, he asserts that there are four distinct aspects of the phenomenon. First, he says that there is the historical form of an institution which is in and of itself not racist, as the organization was created for a homogenous society. Second, he argues that these institutional arrangements may disadvantage minority groups and thus require corrective assessments and implementation of non-discriminatory arrangements. Third, Halstead calls attention to the power of the white majority over these institutional arrangements and argues they may be intentional or unintentional. The arrangements may be intentionally perpetrated for racist reasons, he argues, because whites see the system as being to their advantage. The arrangements may be perpetrated intentionally for non-racist reasons, he argues, because of tradition or custom. Finally, Halstead writes that once discriminating consequences of the arrangements are exposed, institutional change should occur. If not, he says anyone seeking to perpetuate them is guilty of racism.

In an influential study, Jones (1997) distinguishes individual from institutional racism that relies on a classificatory or taxonomic system for forms of discriminatory expression. For Jones, individual racism can take either a dominative/aggressive form or an aversive form involving avoidance of those of other races, prompted by feelings of unease or discomfiture. The same author describes institutional racism as behavior directed toward entire demographic categories rather than individuals and says that it may be thought of as an extension or aggregation of individual racism. Jones (1997) further describes two forms of institutional racism, individually mediated and standard-of-practice discrimination. *Individual-mediated racism* refers to the substance and impacts of institutional policies and practices (such as hiring and promotion procedures) that are influenced by individuals who (knowingly or otherwise) have racist outlooks. *Standard-of-practice* discrimination includes institutional practices that directly or indirectly restrict the professional access and mobility of individuals or groups on the basis of race. For Jones, individual and institutional variants of discrimination may lack full cognizance or intentionality, but it is no less harmful for lacking willfulness.

Essed (1990) notes an overlap between individual and institutional forms of discrimination. When individual prejudices are enacted in

institutional settings, for instance in aggregate failures to extend to colleagues of color the same social supports as others, the result may be the creation of a climate of nonacceptance that affects those colleagues' career chances.

Distinctions between individual racism and individually mediated institutional racism are necessary in development of a nuanced and useful understanding of employment discrimination in the context here described. Insisting on the institutional dimensions of action and impacts obviates the self-serving tendency to limit considerations of racism to individual, fully conscious, and explicit or overt action. Racism is insidious because it is so often hidden among institutional practices which are, in effect, aggregations and accretions of individual attitudes over time.

The National Association of Social Workers has referred to institutional racism as the manifestation of racism in social systems and institutions, contending that "it is the social, economic, educational, and political forces or policies that operate to foster discriminatory outcomes" (NASW 2007). Others (Barker 2003; Brandt 1991) have argued that institutional racism results from the arrangement of policies and procedures that are tied to bureaucratic structures and thus produce unequal distributions of outcomes for people of color. Penderhughes (1989) contended that such *power-assigning structures* take the form of institutional racism and affect not only life opportunities but also the life-styles, and the quality of life for people of color, as well as for Whites. In doing so, such arrangements exacerbate and distort perceptions of biological and behavioral differences.

An observation of institutional racism and administrative leadership (Ward 2001) pinpointed the need for organizational leaders to be more cognizant of cultural differences when conducting performance evaluations. This was found to be especially relevant when minorities were being evaluated for the first time in previously all white organizations or departments. The author cited the example of a newly hired Hispanic field employee whose supervisor received complaints that the employee was not friendly and lacked good communication skills. The supervisor was alarmed because in the 10 years he had worked for the organization, he had never received any complaints from constituents. Should the supervisor consider the complaints valid and include them as part of the employee's performance evaluation or should the supervisor place the complaints in a broader cultural context before considering them valid? According to the study, if the supervisor does the former, he becomes part of the problem rather than the solution and thus perpetuates cultural racism (also see Ward and Rivera 2014).

Cultural racism exists when the culture of a minority group is seen as *flawed* and thus as standing in the way of the group's progress. The minority group is encouraged to relinquish its own culture and adopt the majority culture including mannerisms and speech patterns.

To the extent that racial and/or ethnic minorities are restricted from upward mobility in public organizations due to institutional arrangements or cultural differences rests decidedly with organizational leaders. Lack of action on the part of administrators may perpetuate the unspoken phenomenon that newly appointed white employees are considered competent until they prove themselves incompetent, whereas newly appointed black or Hispanic employees are assumed incompetent until they prove themselves competent or the belief that African Americans must work twice as hard to prove their competence (Ward 2001; also see Arrow 1972).

Other forms of so-called unintentional racism include paternalistic racism and color-blind racism. Whereas institutional racism stems from the failure on the part of the majority to adapt to diverse organizations, paternalistic racism suggests that white people have the right to interfere in the lives of black people for the good of black people and the influence to decide what is in the best interest of black people (Halstead 1988).

Color-blind racism is most closely associated with the term unintentional racism. Yet, in public organizations as well as in society at large, it may lead to injustice by ignoring the history, experiences, and needs of black people and other minorities. Halstead (1988) argues that injustice is

caused by color blindness when people are treated the same when in relevant respects they are different, just as when treating people differently when in relevant respects they are the same.

Much of the study of racism (see Rivera and Ward 2010) has placed emphasis on the adverse impacts of direct expressions of prejudice or the exclusion from serious consideration for employment. However, the impacts of racism and prejudice may be more often felt through indirect actions and behaviors. For example, indirect manifestation of racism may involve the exclusion from mutual support networks on which employment so often relies. It is not, in other words, the direct repudiation of minority candidates at the point of the hiring decision that is key to minority under-representation, so much as the exclusion of such candidates from collegial networks based on mutuality.

One countervailing trend is the increasingly common practice among graduate programs in public affairs of helping to develop supportive collegial networks and mentoring programs for minority hires. Another is the development of cultural-competency and diversity curricula in graduate public affairs education (see, e.g., Rice 2006).

While some successful practices are being developed in this regard, the problem is also a philosophical one. The germane literature relating to representation of faculty of color in public affairs programs suggests that there continues to be confusion over what is diversity and what is equal employment opportunity and what the larger agenda might be for these elements of employment equity regarding public administration in particular. An equal employment approach may amount to little more than risk management (e.g., aimed at avoiding discrimination actions or maintaining accreditation), while a diversity approach would turn to a positive commitment to representativeness and equity. The former operates in the institutional domain of the law and the latter in the normative realm of public ethics or the *ethos* of the discipline.

Today, some of the most nuanced treatments of diversity and the changing workforce come out of the business administration literature. Argyle (2007) argues that the "public sector was in the forefront of implementing AA/EEO, serving as a role model for the private sector [but] the same cannot be said when it comes to managing diversity." He finds that the private sector now leads in this area, while the public sector is decidedly behind. In short, the public sector may have relinquished much of its leadership in the area of diversity.

However, recent work by public administration scholars is attending more closely to the public sector performance implications of diversity. David Pitts of Georgia State University and Elizabeth Jarry of the University of Georgia (2005) have produced a strong empirical treatment linking diversity and organizational performance. Noting that theirs is "the first public administration study to use large-N data to link a measure of diversity to organizational performance," Pitts and Jarry (2005: 26) remark that public administration still awaits its first qualitative data study to achieve the same goal. However, haltingly, research on both the performance and normative implications of diversity is gaining centrality in public administration scholarship.

One prevailing view is that institutional racism may be diminished, and diversity enhanced, through effective cultural-competency training (see Ward and Rivera 2014). According to this perspective, cultural-competency training should be emphasized in all organizations irrespective of sector, but especially in racially diverse organizations and organizations serving diverse constituencies in the public sector. Examples of effective cultural-competency training were found in the areas of community-policing initiatives, where increased citizen involvement helped to foster positive relationships between the citizenry and the law enforcement community, toward the goal of reporting and reducing crime (also see Ward 2002). Other effective examples were found in the social work field. However, as previously mentioned, such training must emphasize the positive understanding of differences, rather than being an

exercise in risk management, or simply pursuing the knowledge of other groups and cultures, which may result in an overambitious exercise, most likely to result in the inadvertent reinforcement of racial, ethnic, and cultural stereotypes. Thus, it is often the matter of the individual courage of a public servant faced with a compelling claim to social equity that makes the critical difference rather than a given set of diversity policies and practices.

Hence, institutional racism perpetuates both intentional and unintentional practices that disadvantage minority groups. In essence, it voids the most earnest efforts at increasing organizational diversity and equity. Most often, it makes for denials of the very reality of racism or of a need to respond to others in a racially sensitive and culturally competent manner. However, those organizations that embrace change in this regard, particularly when they have recognized the existence of institutional racism within their midst, are much more likely to respond successfully to the demands of an increasingly diverse polity, society, and marketplace. In addition, and although risk management should not drive diversity programs, such organizations are also much less likely to also be exposed to the risks associated with racial and cultural insensitivity.

## Synonyms

Organizational theory pertaining to institutions

## Definition

Perspectives about how organizations develop cultures, systems of patterned behaviors, and recurring processes.

## Introduction

The economic theory of the nonprofit sector states that the sector's existence is attributable to market failure, pluralism, and needs for modernization, trust, and solidarity. Nonprofit organizations are structured in accordance with democratic, collective/feminist, hierarchical, and elitist approaches. As individual nonprofit organizations become larger and more complex, they become *institutions*. Social scientists apply the term "institutions" to organizations that have developed a well-defined structure and a *culture* founded on rules, folkways, mores, and customs. The culture influences the behavior of the organization's members, making it consistent. Institutions in a field of activity converge toward similar structures and cultures. Deviations from this pressure for convergence, when they occur, are brought about by "institutional entrepreneurs."

## Institutional Theory in Economics, Political Science, and Sociology

### Origin of Institutional Theory

The attention of a large proportion of social science scholars has been caught by the concept of institutions during the last few centuries. For example, ever since the US Constitution went into effect in 1789, many American political scientists have assiduously studied Congress, executive agencies, and the Supreme Court, described their interactions, and analyzed the extent to which they influence the making of public policies. That approach to the study of public policy is known as "institutionalism." In general, the term "institutional theory" refers to the strain of thought that places institutions at the center of social interaction and production of results. This theory attracted adherents beginning in the 1850s. Sociologists who used the concept of institutions as a framework for their analyses include Herbert Spencer, Karl Marx, Émile Durkheim, Max Weber, Charles Horton Cooley, Talcott Parsons, Robert K. Merton, Philip Selznick, and Everett Hughes. Since the 1970s, most social science research that focuses on institutions has been said to be expounding on "new institutional theory" or "neo-institutionalism."

### Definition of Institutions

The "new institutional theory" holds that the definition of an institution goes beyond the definition of an organization. A group of people who want to address a social problem may assemble and declare that they are founding a nonprofit organization. But the organization is unlikely at that point to have been institutionalized. To be an *institution*, a group must have developed the following features:

- There must be an intention that gives the group a raison d'être. The reason may be expressed as a mission, a vision, or a platform.
- There must be a structure in accordance with which the relationships of the members with each other are specified. The structure is the means through which the organization's purpose is implemented.
- There must be a set of rules, folkways, mores, and customs. The rules, folkways, mores, and customs constitute a culture that channels the behavior of the members, thus making the behavior consistent, predictable, orderly, and stable (Scott 2014; Miles 2012).

The sociologist Selznick explained that a group becomes an institution over a period of time, during which the group develops a history, the personalities of its members shape its development, its members attach variable amounts of value to forms of process and product, and the group selects ways of interacting with its task environment. Selznick also observed that organizations with the least well-developed technologies and the most ambiguous objectives are most likely to become extensively institutionalized (Scott 2014).

### Legitimacy and Conservatism

In so far as an institution has folkways, mores, and other customs, presumably its members internalize these aspects of its culture and perceive that behavior conforming to them is right, proper, and even moral. Members act in accordance with the norms not just because such behavior is expected, as the sociologist Parsons explained, but also because the circumstances socialize them to believe that the behavior is worthy.

Because they hold this belief, the members perpetuate the culture, so that it persists. The conferral of legitimacy discourages deviating behavior and reinforces the cultural framework. Even as the original members have left the organization, their successors have learned the norms and reproduce the culture without any particular deliberation. "We have always done it this way" becomes a forceful rationale for continuing to do things that way, whether the norms serve the organization optimally on any given occasion or not.

The perpetuation of traditions developed long ago exerts a conservative effect on institutions and the society they serve. Any revision of the culture is likely the initiative of an influential, persuasive change agent, who makes a calculation that deviation from the norms will serve a pressing need that he/she perceives at that point. Ordinarily, however, an organization's leaders will be loath to disturb an existing culture that fosters consistent, predictable, voluntary, and orderly conduct and thus tends to serve their interests (Scott 2014; Miles 2012).

### Rationality

A central rationale for the use of institutions as devices to accomplish goals is that institutions foster rational behavior. Political scientist Herbert Simon wrote, "· · ·[T]he rational individual is, and must be, an organized and institutionalized individual" (quoted in Scott 2014, p. 29).

The theories of Frederick W. Taylor, founder of the scientific management school, and the sociologist Max Weber assumed that managers had complete information – or at least the means to compile it – with which to make rational decisions. Therefore, managers would have the opportunity to bring about optimal results.

In describing "administrative behavior," Simon disputed the assumption that managers have anything other than incomplete information. Then, in making decisions, managers are also constrained by human limitations on being aware of available options and their costs, benefits, and unanticipated consequences, by limitations on how much time and money can be dedicated to decision-making, and by being affected by biases as they sort through alternatives. In the presence of such sources of uncertainty, managers must resort to methods that offer *bounded rationality*. Bounded rationality is apparent in the following manifestations:

- As philosopher David Braybrooke and Charles E. Lindblom, a political scientist and economist, described, administrators make policies using the process of "muddling through" – incremental decision-making that designs the next round of policies by making small changes to the preceding round of policies. Incremental decision-making averts provocations to stakeholders, because they do not need to adapt to sudden changes in direction and there is continued reliance on previous compromises.
- Managers may develop courses of action with the use of such heuristic (rule-of-thumb) approaches as trial and error.
- Simon observed that administrators may settle on suboptimal measures that, though they do not optimize, *satisfice* stakeholders. The term "satisfice" is a combination of "satisfy" and

"suffice." Mollifying stakeholders is accepted as an acceptable alternative to the costly and essentially impossible aspiration of finding the best of all possible options (Anheier 2014; Scott 2014).

### Isomorphism

As indicated above, institutional theory states that the members of an institution will act consistently in accordance with the group's norms. Institutional theory goes further in asserting that all organizations in a single field of activity (e.g., public schools) will develop fairly similar structures and cultures. In 1968, human ecologist Amos Hawley observed that the uniformity of environmental conditions causes the similarity of structure and culture. *Isomorphism* is the term that describes how institutions in a field of activity resemble each other. Sociologists Paul J. DiMaggio and Walter W. Powell identify three categories of isomorphic process.

- When the similarity is caused by pressure from other organizations to act in accordance with rules or standards, the process is *coercive isomorphism*. These organizations may be regulatory agencies, watchdog organizations, or sources of funding. Their requirements may force otherwise informal organizations to become bureaucratic, professionalized institutions that conform to standards of financial reporting, performance evaluations, and certification requirements.
- When the similarity is caused by uncertainty due to technology underdevelopment or dynamic environmental conditions, the process is called *mimetic isomorphism*. Organizations may react to the uncertainty by imitating organizations that are coping successfully. Nonprofit managers may adopt functions and strategies of the for-profit sector that have proved successful in managing the uncertainty.
- When the similarity is caused by professional standards and practices imposed by the content of education and training programs, codes of ethics adopted by professional associations, and similar sources of professional expectations, the process is called *normative isomorphism*. "For example," Anheier writes, "the rules, regulations, and ethics of the social work profession contribute to similarities across social service and welfare agencies, irrespective of organizational form" (Anheier 2014, p. 280).

Institutional theorists recognize that, on occasion, leaders of organizations may opt to resist some of the pressures that trap organizations in similar patterns of structure and culture. Such leaders are labeled as "institutional entrepreneurs." They may act individually or organize a coalition. In this way, change agents can overcome the homogeneity that the process of isomorphism otherwise produces (Anheier 2014; Miles 2012; Scott 2014).

## Rationale of the Nonprofit Format

Nonprofit organizations arose to address societal needs that governments and profitable enterprises address insufficiently. This section lists five contributions that nonprofit organizations provide to a society:

- Modernization
- Market failure
- Trust
- Pluralism
- Solidarity

### Modernization

Lester Salamon explained that nonprofit organizations generate support from the community for and deliver the support to those in need today just as families and tribes would help their members long ago (Bachani and Vradelis 2012). In feudal Europe, communities were based on the existence of estates owned by lords on which serfs were employed on the basis of permanent relationships with the respective lords and with other serfs. Accordingly, each lord had an ongoing affiliation with his peers and each serf had an ongoing affiliation with his peers. If help were to be needed, one would know exactly to whom to appeal for assistance. The Europeans who emigrated to

North America found a virtually limitless expanse of land. If feudalism was the answer to the scarcity of land in Europe, it was the solution to no problem at all in the New World. Instead, a society without formal economic classes arose. However, the lack of formal classes posed the problem of where an inhabitant of this New World would find assistance were he or she to encounter a pressing problem.

As a natural development, voluntary associations arose, such as the volunteer fire department that Benjamin Franklin famously cofounded in Philadelphia. Furthermore, the framers of the US Constitution remained jittery in 1787 from the very recent spectacle of Shays' Rebellion, in which a group of debt-ridden farmers in western Massachusetts marched to the east intending to bring down the commonwealth's government in Boston in order to deprive the creditors of the arena in which to enforce debts. Thus, the framers explored the threat of factions to popular government. As James Madison explained in a 1787 article in New York newspapers (known as *Federalist* 10) as he solicited support for ratification of the proposed US Constitution, the framers chose not to outlaw factions but rather to allow them to proliferate in a national (essentially centralized) political system, so that they would be so numerous as to neutralize each other's potential for destabilizing the political system. So effective was this stratagem that, by the 1830s, French social observer Alexis de Tocqueville found in the United States a vibrant population of voluntary associations, each arising because some American recognized a social problem and set out to address it. In 1944, Arthur Schlesinger described a "lusty progeny of voluntary associations" in the United States (quoted in Anheier 2014, p. 15). These associations participate in helping society to adapt to changing conditions and new circumstances that bring with them new problems.

## Market Failure

Markets would allocate resources satisfactorily if there were perfect competition and there were purely private goods. Perfect competition requires countless vendors and customers and access to perfect information about the goods being exchanged.

Capitalist economic theory assumes that there are an infinite number of vendors and an infinite number of consumers. If that were the case, then, in theory, the price of any item would be the price at the intersection of the supply and demand curves – i.e., the only price at which the exact number of units that vendors are willing to sell is equal to the exact number of units that consumers are willing to buy. However, if the number of vendors is very limited, as in the case of monopoly or oligopoly, or if the number of consumers is very limited, as in the case of monopsony (the presence of only one buyer), market failure exists and one or a few parties can manipulate the price to their own advantage.

Goods are purely private if they are consumed fully by whoever purchases them and if there are no externalities. Externalities occur when, in the course of a voluntary marketplace transaction between two parties, an uninvolved third party is affected by the transaction as well. If markets were perfect in these terms, the existence of nonprofit organizations could not be deemed useful.

Nonprofit theory suggests that nonprofit organizations would not exist in a perfect marketplace and that market failures account for the demand for such organizations. In 1980, Henry Hansmann, an expert in the economics of law, argued that situations in which complete information is not available to all parties generate the interest in having nonprofit organizations, because such organizations remove from the circumstance owners who, motivated by their desire for profit, might withhold information to consumers. Removal of the profit motivation dampens the desire to behave in an opportunistic manner.

Society has a need for public goods. Public goods are a form of "positive externalities." This refers to transactions between two parties that confer a benefit on otherwise uninvolved third parties. For example, were a private organization to set out to overcome the problem of pollution, and it solicited funds from individuals, the organization's output would benefit individuals who were unaffiliated with the organization and did not

donate funds. There is a good chance that the donors would eventually become weary of conferring benefits on "free riders" and would terminate their philanthropic sacrifice. This is a rationale for the government to undertake the creation of public goods and to require all citizens to contribute to such programs through taxation. Arguably, the government's various forms of assistance to disadvantaged members of society also constitute public goods. However, government cannot necessarily be relied upon to solve manifestations of poverty. Elected officials have the motivation to please the average voter, but those citizens who need more than the average amount of government assistance or service will demand more than the political officials are willing to deliver. The duty of providing more than the median-level demand for the public good falls to the nonprofit sector.

### Trust

Because nonprofit organizations do not have owners who anticipate profit and who might, therefore, withhold information, consumers may have more trust in nonprofits than for-profit enterprises. This may be especially the case in human service delivery, such as day care, education, and health care. People who are in a vulnerable situation might seek out sources of assistance that they perceive to be altruistic and service-oriented. Thus, they may be able to avoid the challenge described by the principal-agent theory. This theory states that a person (the "principal") may need assistance with a problem and, therefore, contracts with another person who has the wherewithal to address the problem (the "agent"). Thereinafter, says the theory, the principal's primary challenge is to monitor the agent and ensure that the agent is acting in the principal's interest rather than in the agent's interest. Removal of the profit motivation arguably reassures the principal of the agent's commitment to the original purpose of the arrangement.

### Pluralism

Tocqueville's analysis was that the circumstances of American life promote the formation of countless associations. Americans create organizations and they join them. A typical American is a member of a variety of associations and carries in his/her wallet a collection of membership cards. This condition is known as *pluralism*. An American's affiliation with a set of groups tends to subject him/her to diverse opinions about political issues, social conditions, and other matters of daily life. The existence of countervailing pressures causes a moderating influence on members of the population. Sociologist Lewis Coser said that pluralism decreases sharp divisions that would bring about class conflict, discord among religious groups, and other bases for desperate conflict (Anheier 2014).

### Solidarity

Because a widespread social problem (e.g., poverty) may not be addressed effectively by for-profit or public organizations and may require a cooperative effort to address it, interested individuals may indicate a preference for nonprofit organizations to arise and to work jointly. This need for *solidarity* may account for the existence of any number of nonprofit organizations (e.g., a local United Way of America fund-raising apparatus – i.e., the confederation that organizes the fund-raising efforts of local charities – and the affiliated voluntary human service organizations) (Bachani and Vradelis 2012, p. 13).

## Development of Nonprofit Research

Anheier (2014) has said, "···[N]o 'field' of nonprofit or voluntary sector studies as such emerged." At best, the study of nonprofit organizations found homes in "interdisciplinary" studies, while sociologist Charles Perrow "declared nonprofits as 'trivial' from the perspective of organizational theory and management" (p. 15).

In 1973, American philanthropist John D. Rockefeller III invited John H. Filer, chairman of Aetna Life & Casualty Co., to head a Commission on Private Philanthropy and Public Needs, commonly referred to as the Filer Commission. Its 1975 report was the most detailed description of philanthropy in the United States created to date and sparked scholarly study of the nonprofit sector in American institutions. The pursuit of scholarship in the field then expanded to other countries.

## Comparison with for-Profit Organizations

Nonprofit organizations are established for purposes that are significantly different from the purposes that motivate the creation of for-profit firms. Therefore, their activities are significantly different as well. Bachani and Vradelis list major differences between nonprofit organizations and for-profit enterprises.

- Nonprofit organizations seek to accomplish a social mission, while businesses seek financial reward.
- The success of nonprofit organizations is assessed based on effecting a social change, while the success of businesses is assessed based on a bottom line of profitability.
- Employees of nonprofit organizations opt for employment in the nonprofit sector based on preference for a cause or lifestyle, while employees of businesses opt for employment in the for-profit sector in order to achieve financial and career growth.
- Leaders of nonprofit organizations tend to make decisions through participative deliberation, while leaders of businesses tend to prefer a command-and-control approach enforced with rewards and punishments.
- Nonprofit organizations must raise funds to remain solvent, while businesses can generate revenue through the sale of products and services.
- Nonprofit organizations are more attached to the communities that they serve, while businesses are free to relocate to places with more compatible business climates.
- Nonprofit organizations must cope with scarcity and are, therefore, accountable to those who provide funding in terms of a variety of abstract contexts, while businesses are accountable to shareholders chiefly in terms of delivering financial rewards.
- In so far as nonprofit organizations endeavor to deliver services, the demand for which exceeds the capacity to supply them, these organizations tend not to need to generate demand, while businesses tend to rely on promotion to fuel demand lest their capacity exceed consumption of their products.
- Nonprofit organizations have an opportunity to cooperate with other nonprofits who are serving the same societal need, while businesses are oriented more toward competition than sharing financial prospect (Bachani and Vradelis 2012).

The differences between for-profit and nonprofit organizations create a need for different strategic management frameworks, as Bachani and Vradelis explain. Business managers rely on a strategy-structure-systems (SSS) approach. Nonprofit managers tend to turn to a social approach of purpose-process-people (PPP). The PPP approach is more compatible with the mission- and values-driven organizations of the nonprofit sector (Bachani and Vradelis 2012).

The political behavioralist Heinz Eulau wrote that role is the "coin of the realm" of the social sciences. His expression of role theory is given significance by institutional theory, in so far as an institution confers roles on its members. Eulau, therefore, indicated that one's behavior is most likely to follow logically from the office that he holds in an institution. As Rufus E. Miles Jr., an assistant secretary in the US Department of Health, Education, and Welfare, explained it, "Where you stand depends on where you sit."

An intriguing question is whether the behavior of managers and employees in the nonprofit sector can be distinguished from the behavior of managers and employees of for-profit firms. The traditional assumption was that nonprofit managers and employees are motivated by altruism and that government employees are called to the public sector by a public service motivation. Enough reports of self-serving behavior of employees of governments and charities exist to at least raise doubts about the assumption. There is research to show that opportunistic behavior occurs with some regularity, that nonprofit employees' actions are sometimes reflective of goal displacement, and that the nonprofit sector's effectiveness in fostering wealth redistribution from affluent donors to needy recipients to alleviate poverty is modest at best. The possibility that nonprofit managers and employees may be using their institutional membership to aggrandize themselves

contrary to stakeholders' expectations cannot be ruled out.

## Options for Structuring Nonprofit Organizations

Literature about the nonprofit sector suggests that there are four options for structuring nonprofit organizations which are the democratic, collective/feminist, hierarchical, and elitist approaches.

*Democratic*. Tocqueville and others long assumed that voluntary associations were inherently democratic. The US Internal Revenue Code requires tax-exempt organizations to be governed by their members. However, the law does not specify the format under which democratic participation will be effectuated. In so far as any number of nonprofits are governed by self-perpetuating boards that can reappoint themselves, Roberto Michels' "iron law of oligarchy" cannot easily be dismissed and may very well describe the conduct of more nonprofits than does Tocqueville's rosy portrait of associations operating in an egalitarian manner as "great free schools" of democracy.

*Collective/feminist*. Repelled by the hierarchical and authoritarian structure of bureaucracy, feminists set out to organize themselves along egalitarian lines. Their preference is to deliberate at length until, if at all possible, a consensus can be reached. Organized as collectives, the feminists' voluntary associations have proved to be stable and sturdy enough to persist for decades.

*Hierarchical*. The bureaucratic structure is ubiquitous across sectors of the economy. This structure is based on hierarchy – i.e., there is a chain of command in accordance with which those members at the top have the most authority and those at the bottom have the least. Accordingly, it is the antithesis of equality and democracy; the control by the minority of members at the top of the organization makes it oligarchical. Power holders find the hierarchical approach to be compatible with their ambitions, and they have the necessary influence to specify how organizations will be structured. In the nonprofit sector, it is certainly true that many founders of socially oriented organizations establish democratic processes, but, as the organizations move through a typical life cycle, they often evolve in the direction of bureaucracy.

*Elitist*. If one peruses the US Internal Revenue Code, he/she will probably draw the conclusion that the law expects nonprofit organizations to operate democratically and transparently. It follows, then, that most nonprofits' corporate charters mention rules that will allow for voting for members of the board and other widespread participation. But rules intended to invite participation can certainly be redirected to ensure elite control. The boards of the most prominent national, state, and local nonprofits tend to be dominated by members of the upper class, who then dictate to other members and volunteers what role in the organizations remains for them. Participation in decision-making is frequently not one of them.

## Conclusion

Management experts and social scientists share an interest in understanding the behavior of members of organizations. Those who lead and participate in nonprofit organizations tend to have motivations oriented toward satisfying societal needs relating to resource deprivation (e.g., hunger and homelessness), culture, health, environmental protection, and humanitarianism. Over time, nonprofit organizations have gravitated toward democratic, collective/feminist, hierarchical, and elitist approaches to organizational structure. There is a long tradition of historical and political inquiry that centered on institutions' organization charts and legally prescribed processes to explain public policies, social stratification, and other outcomes. The new institutional theory, originating in the 1970s and also known as "neo-

institutionalism," explores organizations – primarily large organizations – more systemically as legions that have structures and cultures that produce "patterned behaviors" of the members. Nonprofit managers often find the orderliness and stability of employees' and volunteers' behavior to be in accord with the managers' preferences. Some social scientists have gathered evidence to indicate that institutions guide managers to display rational behavior that produces better results than do arbitrary, whimsical decision-making formats.

# Institutional Theory of Organizations

Olivier Berthod
Department of Management, Freie Universität Berlin, Berlin, Germany

## Synonyms

Institutionalism; Institutional analysis; Institutional theory; New institutionalism; Organizational institutionalism

## Definition

The institutional theory of organizations puts institutions at the core of the analysis of organizations' design and conduct. From this point of view, organizations are local instantiations of wider institutions. Institutions, understood as taken-for-granted beliefs, rules, and norms, shape the creation and spreading of organizational forms, design features, and practices. Complying with institutionalized prescriptions is considered a means for gaining legitimacy, decreases uncertainty, and increases intelligibility of organization's actions and activities.

## Introduction

The rise of institutional arguments in organizational analysis reflects a sense of dissatisfaction with theories that put efficiency at the core of organizational action. Organizations do not operate in a vacuum. They must deal with a multitude of external influences, such as cultural differences, legal requirements, conventions, and norms, and with the demands raised by a diversity of actors, e.g., suppliers, customers, regulatory agencies, NGOs, or trade unions. Efficiency, from this point of view, is subject to constant, collective redefinition. The resulting beliefs, rules, and persisting expectations explain choices in formal structures and organizational practices (e.g., ISO norms, information technologies, CSR standards, or the divisional form). This idea was provocative, because it explained why there was such homogeneity of design features and practices among organizations (Meyer and Rowan 1977; DiMaggio and Powell 1983; Zucker 1977). This approach is also referred to as the "new" institutionalism – "new" to distinguish itself from older treatments of organizations as institutions in which issues of power, politics, and change were more prominent. Contemporary works, however, have reconciled both approaches. This brief entry covers this development.

## Why Institutional Explanations?

Institutions, broadly speaking, are those beliefs, rules, roles, and symbolic elements capable of affecting organizational forms independent of resource flows and technical requirements (Scott 1991: 165). Such beliefs, rules, roles, and symbolic elements can be of different natures (Scott 2013): regulative (i.e., required/enforced by law, as it is the case with specific accounting standards), normative (i.e., enforced by a shared sense of what is appropriate, e.g., the expectation that elected leadership represents the interest of its constituents), or cognitive (i.e., taken-for-granted, mental models of how work should be done, as it is the case with most routinized behavior in organizations).

Economists interested in institutions tend to focus on regulative institutions, while organizational scholars and political scientists embrace societal norms and taken-for-granted beliefs as drivers of organizational action. In earlier developments, institutional arguments remained close to the notion of resource dependence. Each organization needs specific resources to survive: businesses need sales, venture capital, or investments; schools need students and funding from state agencies; NGOs need fundraising and media attention; unions need members and their fees; etc. Resource dependence argues that organizations need to appear "legitimate" in the eyes of the most important resource holders (customers, blue-collar workers, investors, etc.). It predicts that a business will generate more sales if its functioning is considered appropriate by its customers; an NGO will receive more funds from charities if its headquarters are in the right building or city and appear powerful; a union might generate more memberships if it focuses on a specific rhetoric or highly desirable goals in its communication, etc.

The resource-dependence approach, however, was often not sufficient for an institutional argument. Legitimacy is defined as a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate (Suchman 1995: 574). Institutional arguments (and organizational institutionalism) moved beyond resource dependence and explained why organizations adopt legitimate design features and practices without reflecting on their relevance. Specifically, institutional explanations rely on the taken-for-granted nature of institutions and not on utilitarian arguments. Davis et al. (1994) made a clear distinction from resource-dependence arguments by highlighting the idea that organizational practices should be considered *institutionalized* if they are widely accepted and used without recourse to analysis or proof for their relevance *and* if they withstand challenges on instrumental grounds (see also Greenwood et al. 2008).

## New Institutionalism and the Spreading of Institutions

More than mere access to resources, relying on institutions is a means for organizations to reduce uncertainty and increase predictability and intelligibility of their actions to their audience. Institutions thus constrain, but also support/enable organizational actions and decisions (Barley and Tolbert 1997). The relational focus between organizations and audiences explains the spreading and stability of organizational practices across whole industries and policy arenas. In this case, Institutional theory of organizations speaks of the constitution of "organizational fields". The concept of "fields" has become popular for explaining how taken-for-granted, shared understandings of organizational designs and practices are debated and shaped over time. A common misunderstanding was to assume that "organizations are kind of wacky, and (...) people are never rational" (DiMaggio 1995: 395). Empirical studies challenged this misunderstanding. For example, Fligstein (1985) studied the spread of the multidivisional organizational form among large firms and looked for the causes of this diffusion between 1919 and 1979. He found that firms were aware rise of the mutidivisional form in their environment and adopted it reflexively. Going even further, Hoffman (1999) revealed that fields emerge when organizations (or their representatives) gather to discuss important topics and shape current and/or nascent institutions. In

other words, the spreading of institutions is a political process that involves many organizations with some interest in the issue at stake.

## Development of the Institutional Theory of Organizations

As hinted in the introduction, a divide had been staged between tenants of an "old" and a "new" institutionalism. The old institutionalism focused more on organizations and how they become institutionalized. Defending older treatments of institutions and organizations (and organizations as institutions), Abbott (1991) pointed out the relevance of change and processes – two dimensions that fell short in the new institutionalism and its focus on homogeneity and stability. In a similar vein, Selznick (1996) expressed concerns about such a sharp differentiation. He worried that such feuds would encourage an undesirable preoccupation with polarities and polemics (1996: 276) instead of studying actual social policies, their implementation, and their challenges. Finally, Stinchcombe (1997) stressed that the new institutionalism underestimated the willingness of people to accept institutions for what they are or not: The guts of institutions is that somebody somewhere really cares to hold an organization to the standards and is often paid to do that (1997: 18). Hirsch and Lounsbury (1997) pleaded for reconciliation. They opposed the determinism of overtly structural approaches. A unified institutional theory, they said, would provide a more accurate picture of organizational actions and structures.

Consequently, organizational change has become a major issue. Puzzled by radical organizational change, Greenwood and Hinings (1996) recognized that the new institutionalism, with its focus on legitimacy and field-wide homogeneity, failed to take change into account. Specifically, the theory did not explain why some organizations would adopt radical change in spite of institutional pressure. The authors opened institutional analysis to issues of power, commitments, and interests within the organization. Since then, the analytical interest of the institutional theory of organizations has shifted from a focus on stable structures toward individual and organizational strategies and influences. DiMaggio (1988) coined the idea of "institutional entrepreneurs" to identify those individuals who set out to change and disrupt institutionalized beliefs. Oliver (1991) linked the institutional theory of organizations to strategic management to account for variations in organizational responses to institutional demands. And on a more settled tone, Powell (1991) proposed looking more closely at dynamics of institutional compliance to find out how enacting institutionalized beliefs in fact contributes to the evolution of these beliefs.

Consequently, research has considered the dynamics of institutional emergence and the process of institutional change (Dacin et al. 2002). For example, Covaleski and Dirsmith (1988) observed how a university adopted budgetary practices that were deemed appropriate and how actors contributed to modifying them using a subsequent period of decline. Elsbach and Sutton (1992) showed how decoupling legitimate structures from illegitimate activities facilitated the work of spokespersons. Similarly, Hargadon and Douglas (2001) showed how Edison overcame institutional rigidity stemming from the gas industry by adapting his electric bulb to the older gas lamps, both in terms of design and of performance. Battilana (2006) wondered how actors manage to produce change when they see opportunities and found an explanation in the individuals' social position. Finally, Greenwood and Suddaby (2006) asked similar questions and observed the introduction of the multidisciplinary practice as a new organizational form among professional business services companies. They demonstrated how centrality in field explained exposure to dissonances and opportunities for change.

## Toward Institutional Pluralism

Institutional theory of organizations has moved from a theory of stability toward a theory of change. Riding this trend, the idea of pluralism has become a major issue. A multitude of

institutional forces infuse society and organizations. Friedland and Alford (1991) argued that a set of central logics underlies the most important institutions in western societies: the capitalist market, the family, the state, religions and the democracy. These institutions are the cradle for a wealth of institutional logics, with many of them contradicting each other. The potential for conflicts and change is not negligible. As Thornton and Ocasio put it: competing logics are not, by themselves, an explanation of change in institutional logics but an antecedent or a consequence (1999: 118).

An organization is often penetrated by institutional demands of a different sort. For example, Townley (2002) documented the introduction of business planning and performance measures and reports in cultural facilities and heritage sites in Alberta, Canada: the operative core, i.e., museum professionals and conservators in the province, declared such attempts "heresy" and resisted the change. Pluralism, however, does not need to end in conflict. For example, Purdy and Gray (2009) reported on the coexistence of multiple practices in state offices for dispute resolution, where no single organizational design seemed to dominate. Therefore, current debates entertain the possibility for organizations to hybridize their design to navigate pluralism. Battilna and Lee (2014) note that the boundaries between design features that were typical for the private, public, and nonprofit sectors have become blurred. Such hybrid designs, despite being a locus for creativity, are less stable due to the tensions that emerge at the interplay of their sometimes contradictory features. A typical example is social enterprises that combine elements from business organizations and charities in their design. A second approach to the problem of pluralism/conflict concerns itself with the strategies organizations can employ (Greenwood et al. 2011). Often, specific members of the organizations constitute an internal representation of various institutions and institutional logics (e.g., doctors and business managers in hospitals will work with very different models and priorities in mind). Compartmentalizing these groups is one approach to the pluralism problem. Other strategies have been suggested, from blunt confrontation to silencing conflicts away, although the consequences of such strategies are not clear. The emergence of organizational identity is increasingly designated as an important resource to institutionalize hybrid designs and reduce the potential for conflicts.

## Conclusion

A chief feature of institutional theory of organization is that it enables an alternative analysis of questions relating to forms and design of organizations in all sectors. The focus on legitimacy, taken-for-granted beliefs, and field constituents provides both a dynamic and embedded view of the conduct of organizations. This approach has been enriched by a wealth of empirical research. However, institutional theory has also been the object of attacks. The notion of field is more elusive than, e.g., the notions of industry or interorganizational networks; organizations are reduced to local instantiations of institutions; and the way individuals are perceived is often criticized as being overly simplistic. Nevertheless, institutional theory provides strong arguments about why and how organizations do the things they do.

# Institutional Trust and Political Participation in Africa

Daniel Dramani Kipo-Sunyehzi
Legon Centre for International Affairs and Diplomacy (LECIAD), University of Ghana, Accra, Ghana

## Synonyms

Democratic participation; State institutions; Trust for institutions

## Definition

Institutional trust is about people who believe in their institutions and take part in their activities.

## Introduction

This research examines two issues institutional trust and political participation. The analysis cut across states and continents. Trust is a form of expectation that arises from a community or people with "cooperative behavior based on commonly shared norms." There are types of trust that people exhibit in a community, society, or state. The focus is on institutional trust and how it affects political participation. This suggests that there is a relationship between institutional trust and political participation of people. Institutional trust is a highly contestable concept and is conceptualized differently and viewed differently by scholars.

The contributions of this research are in three ways. Firstly, it adds to the extant literature on the field of institutional trust and political participation in general and specifically in the context of Africa. As it delves deeper into the relationship between the two concepts, it looks at their applicability across states and across regions of the globe, with specific reference to Africa. Secondly, this research identifies influencing factors that connect institution trust to political participation with some insights on "critical citizens" as in advanced democracies in the world. The "autonomous citizens" – who are the active ones or the "mobilized subjects" – passive citizens institutional trust for political participation in new and emerging democracies which are largely in Africa. Finally, this research attempts to bridge the literature gap in institutional trust and political participation in Africa and highlights some facilitating and inhibiting factors in Africa.

Khodyakov (2007) conceptualized institutional trust as people having trust for their system based on the public's "perceived legitimacy, technical competence," as well as ability to carry out "assigned duties efficiently." To what extent institutional trust facilitates or inhibits political participation in countries is of interest particularly in Africa. Suh et al.'s (2013) survey results show that institutional trust-oriented people are more likely to participate in political activities like expressing of their opinions toward the government and voting than those with distrust or no trust for institutions. It also demonstrates that institutional trust has effects on political participation with some positive influence over democracy. Thus, they suggest that public trust for institutions lays the foundation for political participation of people or individuals. The trust is that the elected elites will make policies to solve their social problems (Suh et al. 2013). The people or the citizens' trust in democratic institutions like Parliament is that their representatives will serve their interest with good laws or policies for public good. Also, where the people or citizens have trust for institutions like the electoral commission, it helps them to participate in the activities of the institution like registrations and or voting during elections.

Thomas Hobbes's "state of nature" describes human life is "solitary, poor, brutish, and short," where society in the "state of nature" looks chaotic. As human society looks chaotic, this calls for some form of leadership or a "sovereign" who shall make laws to regulate society. The government also shifted from the few to masses and from direct democracy-Greek "city-states" (city center or town hall meetings) to representative democracies (modern democracy). As human society evolves, types of government keep changing to suite the changing conditions. All these stages of human development or types/forms of government involve the participation of people in decision-making with those who rule and those who follow (some rule; others follow). Next is the concept of political participation in modern states. Political participation involves legitimate and illegitimate, voluntary and involuntary (forced) participation in an attempt to influence the public policy-making process as well as the involvement in choosing political leaders which may take forms including voting or elections and participation in issues of "development policy and governance" in Africa and other parts of the world (Huntington and Joan 1976; Hyden 2013, p. 2; Suh et al. 2013; Kipo-Sunyehzi 2020).

Suh et al. (2013) used political participation as a dependent variable with four elements, namely, voting, online expression, expression toward government and media, and participation in political campaigns, political demonstrations, and strikes.

The four dependent variables are used in the analysis of binomial/multinomial logit regression. They thereby analyzed the types of trust (institutional trust) in relationship with the four variables of political participation. The work of Suh et al. (2013) is very relevant to this research as it looks at how institutional trust influences individuals' political participation in Africa. There are other relevant literatures on institutional trust and political participation outside Africa which are analyzed or used in this research.

Askvik and Jamil (2013) also map out institutional trust in developing countries' context with particular reference to Bangladesh. They look at the extent to which people (citizens) "perceive public institutions to be trustworthy" against popular perception that the people in Bangladesh do not consider public and political institutions as trustworthy. Askvik and Jamil (2013) look at the paradox in experts in governance issue assessment of citizens' trustworthiness for public and political institutions as low, while the public (ordinary Bangladeshis) trustworthiness for the same institutions as high particularly trust for parliament and central government in recent survey results (country-wide door-to-door questionnaire survey including 2,000 households conducted in 2009 in Bangladesh). Thus, Askvik and Jamil's (2013) focus is on the gap between experts' judgments and popular perception of trust for public and political institutions in Bangladesh. It may be interesting to understand what factors or circumstances led to the high institutional trust among Bangladeshis, while the governance experts' results suggest a low institutional trust in Bangladesh. The governance expert's claim of low trust for public and political institutions is based on these factors: public office holders (public officials) exhibit less commitment to institutional policies, less benevolence to citizens, and limited honesty and competence and exhibit partial fairness. The high trust for public and political institutions among the people is also associated with the culture of large/high "power distance" where people accept that power is "distributed unequally" and accept power hierarchy as such (Hofstede et al. 2010). Connecting the ordinary Bangladeshis institutional trust to political participation, the results of Askvik and Jamil (2013) suggest that ordinary people trust can use their democratic structures (public and political institutions) to effect change (change leaders or maintain status quo). Hence the "power distance" concept fits well into the general Asian paternalism and authoritarianism ideals. Hossain (2008) examines institutional trust among the poor in Bangladesh and their levels of political participation. Her work reveals that most of them turn to trust the government as "the protector of the poor" as they participate in voting to keep government as it delivers their needs (Hossain 2008. p. 2). Besides Bangladesh, a number of developing countries' survey results (afrobarometer rounds 1 and 2) show trust for political institutions for president and government, with the level of trust from moderate to high (Logan and Machado 2002; Bratton et al. 2006).

Institutional trust may also be influenced by socioeconomic factors in developing countries or may be due to "blind trust" for institutions (Sztompka 1999) as he looks at rising and falling levels of trust in Poland. Sztompka's work reveals the reciprocal relationship between "trust and democracy" in developing world context with specific reference to postcommunist Poland. Other trust experts or specialists look at situations of people with low and high trust for institutions. Van de Walle and Six (2014) indicates that "high levels of public trust" are evidence that the government performs "effectively, efficiently and democratically" while "low trust" is an indicator that the government must be doing something wrong or government institutions responsible for public services provision do not deliver them and it is a reason for worry by people or citizens (Van de Walle and Six 2014, p. 3). Thus, low levels of trust may also be reflected in a decrease in civic activities and behavior as well as a decrease in voting behavior or patterns among the people or citizens.

In a survey conducted in Japan and South Korea, the results indicate that perceived government performance in terms of economy, political corruption, quality of public services provided, and crime is positively associated with public

(the citizens) trust in government (Kim 2010). To increase institutional trust (trust in government), it recommends that government leaders (politicians) in Japan and South Korea need to develop more opportunities for both online and offline citizens to help citizens' participation, communication, and engagement in governance affairs.

## Causes and Effects of Institutional Trust and Political Participation in the Developed World

Scholars acknowledge that the causes and effects of institutional trust are complex and vary with regard to citizens' participation in political events. Many scholars link institutional trust (trust in government) to "citizens' perception of economic and political performance" especially in the developed world (Mishler and Rose 2001; Donovan and Bowler 2004; Kim 2010). Other scholars link or connect institutional trust (trust in government) to political culture and citizen-state relationships (Bouckaert et al. 2005); Christensen and Lægreid 2005). Some scholars put their emphasis on the changing behaviors as well as the changing values of people or citizens for the low trust for institutions which invariably affect their political participation (Andrain and Smith 2006; Kim 2010; Van de Walle and Six 2014). These changing behaviors and values of citizens are increasing in their numbers in the developed world who are very courageous to challenge their institutions and used many forms to express their opinions including protests. These groups of citizens are termed the "critical citizens" (Norris 2011). In this regard, Norris examines the consequences for "active citizenship for governance, and ultimately for democratisation" in established democracies (Norris 1999, 2011).

Wang and Wart (2007) also look at some causes of lack of trust for institutions (government). The decline in institutional trust may be associated with many factors like increased cynicism among electorates and citizen-consumers, increased knowledge level of the citizens about their institutions and their shortcomings (weaknesses and scandals), and citizens becoming disappointed in government or institutional performance in the delivery of quality services. They also provide some solutions to the problem of declining trust for institutions. There is the need to provide more information and education to the citizens on some accomplishments and roles of government and encourage public participation which may help increase their institutional trust. What is intriguing here is the normative argument that public participation leads to public trust. Logically, some elements of public or political participation may lead to trust, while others will not. While Wang and Wart's (2007) work examines how public (political) participation affects public trust, this research interest or focus is on the relationship between institutional trust and political participation.

A cross-country research work also focuses on the relationship between "political participation and trust in government" (institutional trust) in Australia and New Zealand with interesting results. In this research work by Goldfinch et al. (2009), they identified these types of trust, namely, "generalized trust," "particularized trust," and "trust in government," and map these types of trust to political participation. The results show that trust in government (institutional trust) is not associated with greater political participation (voting, meeting with politicians), thus confounding their expectations – thus the expectations do not met due to extraneous/outside influence on dependent/independent variables (Goldfinch et al. 2009). This research now discusses the two concepts in the context of Africa.

## Institutional Trust and Political Participation in the Context of Africa

The researcher reviews or examines some relevant literature on institutional trust and political participation in Africa and their relationships. Lavallée et al. (2008) look at the relationship between institutional trust and corruption with the assumption or hypothesis that corruption can strengthen citizens' trust for institutions. However, their empirical findings did not support the hypothesis or the theoretical argument. They rather found

corruption never produces institutional trust ("trust-enhancing effects") in sub-Saharan Africa. Corruption does not promote trust for "political institutions" which they defined in terms of the president, parliament, electoral commission, and political parties (ruling and opposition) in the afrobarometer survey (Lavallée et al. 2008).

Not many studies have been done in Africa as far as issues of institutional trust and political participation are concerned. A study in Zambia reveals that "institutional considerations have been underemphasised and misinterpreted in explanations of political participation" (Bratton 1999, p. 550). The study connects political institutions to ways the people of Zambia participate in political issues under the new democratic dispensation that occurred in Africa after the collapsed of the communist regime in the late 1980s and the early 1990s. It indicates that citizens of Zambia political participation depend on their affiliations, mass mobilization campaigns, agencies of voter registration, political parties, and voluntary associations. Such political participation also depends on the way political institutions operate in Zambia especially whether the institutions "reinforce or break with practices inherited from the past" – political life (Bratton 1999). This suggests that once the people have trust in political institutions, it creates opportunities for political participation, and where there is so much distrust for institutions, it "can constitute obstacles to participation" (Bratton 1999, p. 550). Political participation is a "multidimensional concept" which involves not only "voting in elections," but it also includes "election campaigning, contacting political representatives, collective action around policy issues, taking part in direct action like protests and demonstrations" (Bratton 1999, p. 552). The 1991 historic general election increased political participation in Zambia, where the citizens have demonstrated trust in the electoral system (institutions).

Two types of citizens are identified in Africa, with regard to their levels of political participation: the active ones (autonomous "citizens") have a high interest in politics and engage others on political issues, while the passive ones (mobilized "subjects") are those with fewer interests in political issues who only participate when they are "persuaded, induced, or compelled by others" (Logan et al. 2006, p. 14). The citizen's institutional trust (particularly political parties) is found to have a higher influence on their political participation, especially among the mobilized citizens through parties' campaign strategies, lobbying power, and mass voter mobilization strategies.

Vinck et al. (2019) examine institutional trust and citizens' participation in health-preventive measures in Eastern Democratic Republic of Congo (DR Congo) in the outbreak of the Ebola virus disease (EVD). The research findings suggest that where the people (citizens at various communities) have trust for their health institutions and leadership, they actively participate in the preventive activities and exercised positive behaviors toward curbing the spread of EVD and vice versa. This emphasizes the importance of trust and participation (Vinck et al. 2019). Some negatively motivated factors are "low institutional trust and belief in misinformation"; such factors reduced the people's willingness or likelihood of accepting preventive measures and positive behaviors toward the acceptance of the Ebola vaccines (Vinck et al. 2019, p. 529). Thus, mistrust and misinformation are factors that increase the people risks of spread of EVD.

A study in Ghana and Kenya also look at the correlation between institutional trust and civil engagement and political participation among students (Sam et al. 2019). Key influencing factors include trust, social endorsement, and social efficacy. The higher these factors, the more the participation of the youth in Ghana and Kenya especially among students. While Ghana had a long history of a multiparty system, Kenya had a long history of one-party system until recent; thus the states exhibit different institutional trust and political participation. Higher trust and more active engagement of university students are crucial for the states' future.

Other studies in Ghana look at the relationship between institutional trust and political trust. The factors that explain or contribute to such trust or those that lead to distrust for institutions. Some factors like government performance, national

pride, and cultural factors are identified as influencers of institutional trust and the cornerstone of democracy. Also, institutional trust is a key feature or it is a "democratic asset" in Africa. Thus, the postulation that an increased institutional trust will enhance "democratic consolidations" where as a reduced institutional trust may lead to "democratic breakdown" ushering in dictatorship or the return of authoritarian rule in developing countries including Africa (Godefroidt et al. 2017, p. 906). There are a myriad of factors that influence institutional trust in Ghana and other African states. Some of the factors are political or cultural; ethnic divisions, feelings of national identification, and the performance of public institutions (high or poor) can create high or low institutional trust. Ghana is credited as "a beacon of hope for democracy in Africa" as Ghana is the "epitome of democracy and good governance in Africa" and seen as model example in the tumultuous West African subregion (Sithole 2012, p. 1). Despite this success story, Ghana still has some issues, and in the context of institutional trust, Ghana is among the "least-trusting societies worldwide" (Norris 2000; Gyimah-Boadi 2009; Delhey et al. 2011; Sithole 2012).

Onyango (2020) adds a new discourse on institutional trust and political participation as this work specifically looks at the correlation between institutional trust and the fight against corruption in Kenya from interagency or interorganizational perspectives of workers, individuals, or the citizens. Some factors like commitment, performance, and personal integrity are influencers.

## Conclusion
